Applications for membership must be made to division pursers, accompanied by the recommendation of an active member and the sum of $2.00 for entrance fee and dues for current year $3.00. Every member attending the general A. C. A. camp shall pay $1.00 for camp expenses. Application sent to the Sec'y-Treas. will be forwarded by him to the proper Division.

Persons residing in the Central Division wishing to become members of the A. C. A., will be furnished with printed forms of application by addressing the Purser.

NEW YORK C. C. FALL REGATTA.—The fall regatta of the New York C. C. will be held at Tompkinsville, Staten Island, on Saturday next, starting at 2 P. M. The programme will include the race for the trophy, 5 miles sailing, Classes A and B together, open to members of all canoe clubs, no entrance fee. Messrs. Geo. Barney in Pecowsic, Grant Edgar in the Rat, C. B. Vaux in Lassie, M. V. Brokaw in Minx, have entered, and others from the Knickerbocker, Mohican, Brooklyn and Ianthe clubs will enter. There will also be a paddling race, ½ mile, for Classes III. and IV., and a unclassified sailing race. The Staten Island boats leave foot of Hitel s ll street every half hour.

TORONTO C. C. FALL REGATTA, SEPT. 24.

THE evening before the fall regatta was spent very pleasantly by the members of the T. C. C., half a dozen of whom were engaged in decorating the club room with bunting, prize flags, canoeing pictures, paddles, etc., while about twice that number were deeply engrossed in listening to one of the members debating on the best way of applying blacklead to the bottoms of their craft and after applying the lotion retired to their various homes to dream of carrying off at least one of the 22 useful prizes which decorated the club table. At three o'clock on the following day about 90 of the members and their friends were present and the first race, paddling, Class IV., decked, ½ mile, was called: First, Ripple, W. A. Cooke, prize, a painting; second, Dottrel, D. B. Jacques, hunting knife; third, Wanda, W. H. P. Weston, vase; fourth, Acis, A. H. Mason, barometer; fifth, Mac, W. G. McKendrick, 0.

As soon as possible the paddling race, open canoes, single blades, was started, and finished as follows: First, Una, Colin Fraser, prize, a thermometer; second, Mojeska, W. B. Raymond, dictionary; third, Ah-Mic, Major Leigh, flask; fourth, Petrel, G. Sparrow, slippers; fourth, Acis, A. H. Mason, cuff links; fifth, Mac, W. G. MacKendrick, 0; sixth, Ripple, W. A. Cooke, 0.

The next race was the event of the season, I was going to say of the year, as I never remember hearing of such a large start in a club race before. We have about twenty open canoes in the club, and the regatta committee associated with the name of each a member who, in their opinion, would make an even team, for instance, if the owner was a big stalwart paddler he was given for a mate one who either knew little about single-blade paddling or was not very powerful, with the result that ten teams were at the starting line, and as the regatta was gotten up in ten days' notice, most of the teams had had only one or two practices, while some had never been together at all, and no team could say whether they would be in the first or last five. Two neatly stamped leather medals had the desired effect of making every one "whang into it" for all they were worth throughout the entire race, and such an exciting and well contested event it has never been my good luck to see before. The following is the record, but as the judge and time-keeper were both hitting it up for a good place in the race no time was taken: First, A. H. Mason, H. Wright, each a set of razors; second, W. A. Cooke, A. Daniel, toilet brushes; third, W. B. Raymond, W. Wright, smoking set; fourth, E. Rice, I. Kelly, pipe and pipe rack; fifth, W. G. McKendrick, H. McLean; sixth, H. Neilson, D. B. Jacques; seventh, Colin Fraser, Geo. Baker; eighth, — Morphy, E. Sparrow; ninth, Major Leigh, W. H. Weston; tenth, A. Shaw, R. O. McCulloch. Every one was of the opinion that the last pair worked as hard for their leather medals as the winners of the first place, and lame shoulders will be carried by some of us as a reminder of the hard work we had hustling to keep away from the rear end of the show. MAC.

TORONTO, Sept. 26.

A. C. A. AUDITING COMMITTEE.—Oct. 3.—To the members of the American Canoe Association. Gentlemen: Notice is hereby given that, pursuant to request of the secretary-treasurer, I have appointed Vice-Commodore Henry Stanton and ex-member of the executive committee William Whitlock, of New York, as a committee to audit the books, accounts, etc., of Mr. William M. Carter, the retiring secretary-treasurer of the Association. Very truly yours, Robert J. Wilkin, Commodore A. C. A.

Yachting.

Address all communications to the Forest and Stream Pub. Co

THE INTERNATIONAL RACES.

SECOND RACE, SEPT. 30, OCT. 1.

AT last the long suspense of the last three months is over, the race that all looked forward to with the most intense interest but a few days ago has gone into history, the possession of the Cup is again decided in favor of the New York Y. C., and events move so rapidly that before the bustle of the races has quieted down the club is face to face with another challenge. All Americans must feel proud of the work done by their champions, work without parallel in the annals of yachting, and all must acknowledge the debt due in behalf of national yachting to the two individuals who alone have retained the Cup for the third time, and against worthy antagonists. Even if Volunteer were an undesirable type of yacht it would be something to think that her sponsors have made a brave and successful fight against the best racing craft that could be brought against them, but the triumph is still greater when it is considered that in addition to retaining the Cup with honor, Messrs. Paine and Burgess have given to American yachtsmen a boat in many respects admirable, free from all the defects of the old national type, and at the same time the superior thus far in speed.

On purely technical grounds the FOREST AND STREAM has long upheld the claims of keel boats, but as applied to Volunteer and others of Mr. Burgess's creations the old arguments against the American centerboard sloop have lost their force. It is still a most interesting issue whether our position, that the keel is fully the equal to centerboard, can be proved with the large compromise boats as it has been between the narrow skiffs and the skimming-dishes in the sizes up to 70ft., but while in the latter case it was a fight against evils and abuses, against a bad and dangerous type of boat and play yachting, and in favor of safe and able craft and deep-water work, it is now only a question of scientific interest, whether there is a peculiar virture in the board that makes it the superior of the keel to windward.

Earnestly as the battle has been fought on both sides, it is not a vital issue any longer, the fact that Volunteer has beaten Thistle is not likely to lead to the construction of centerboard yachts abroad, while no possible superiority of the keel boat can drive the centerboard entirely from American waters. The many advantages of keel boats have been generally conceded here, a large proportion of the fleets are of that class, while the lessons as to lead keels and cutter rig have been too firmly impressed on all ever to be eradicated. It is natural that the defeat of Thistle should be a severe disappointment to all adherents of the keel boat, but whichever way the final issues of beam and board shall be decided is a matter of comparative minor importance, and contrasting the condition of American yachting to-day with that of ten years ago, looking at Volunteer alongside of Vision and Arrow, at Fortuna besides Mohawk, we can feel that the long battle for safer and abler craft first begun by the FOREST AND STREAM has not been in vain.

After the race of Tuesday an attempt was made by Mr. Watson to secure a dock for the following day, in order that Thistle's bottom might be examined, chiefly in consequence of a feeling that prevailed with Captain Barr and the crew that there was something wrong. He was unable to do this, however, and the idea was abandoned, an examination of the bottom being made as far as possible by sweeping the keel from bow to stern with a rope, no obstruction of any kind being discovered. Thursday morning broke with fog and rain but no wind, the boats were at the Lightship in good time, but after waiting until noon the race was postponed to the following day, the fleet starting for home. It was reported that Volunteer had hauled out and cleaned bottom on Wednesday night, but the rumor was incorrect.

On Friday morning the weather was no better, a thick mist, unusual at this season of the year, a heavy rain at intervals with a drizzle between, and very little wind, what there was being about northeast. When the fleet of Americans arrived in the neighborhood of the Scotland Lightship, Electra anchoring at 10 A. M. both the racers had come out from the Horseshoe under mainsails and jibs, and were working about near the line. The fog had thinned a little but the wind was light, about 15 miles per hour, and nearly due east. The committee decided to start the race and at once sent away the tug Haviland, in charge of Steward Neils Olsen, to log off 20 miles, E. by N., making the course nearly parallel with the Long Island shore. There was a fair chance of more wind and some sea further out, there being little sea at the Lightship, but all that was met was a wind sea of very moderate proportions and that troubled neither boat seriously, though the wind did increase later, the range through the day being from 15 to 25 miles per hour. Whole gales, half gales, and "Channel seas" were absent, only a moderate working breeze and small chop seas, making a very fair sailing day.

A start once decided on, both set jibheaded topsails and staysails, Thistle carrying her No. 2 jib and small staysail. At 10:30 the preparatory gun was fired from the flagship, and a few minutes later the struggle for first place began. The flagship lay a little south of the Lightship, and both racers were on her starboard side. Thistle worked about to windward of Volunteer, and as the time shortened to two minutes she stood off to the westward on starboard tack, with Volunteer a little astern. When but a minute was left she came full for Electra's beam, gather g way each moment, then, when it seemed that she was about run square into the flagship, she paid off, rounded on her heel d ctly under Electra's stern, and ran along so close that one could ch a penny aboard, and then, timed with magnificent precision, he cut the line right in the puff of smoke from the starting gun. A prettier start was never seen, a closer one is not possible, th handling throughout was superb. Her rival, however, was not far behind, right in Thistle's wake and just astern of the flagship, heeling until the garboard was nearly in the air as sheets came in. She rushed past the line but 30 seconds later, and then Captain Hall sent her far out to windward by a bold luff directly under Electra's bow, letting her run well out on Thistle's weather before settling down to the work of the day. Such a start alone was something to remember, to call to mind through the winter, to tell of years hence when other races for the Cup are being sailed, and to boast that one was there to see. The honors were well divided between the two skippers, but though astern, Volunteer had the weather berth; little if she was not able to hold it and foot at the same time, but much if she could do both.

In the two previous years both Genesta and Galatea have gone over the line astern of their rivals in starting to windward, and much has been said about the superior skill of American skippers. This year Captain Barr has led in both starts, but according to the general reports this was done designedly by Volunteer, excellent reasons for starting last being given. We have not learned that yachting practice has changed greatly in this respect within three years, if Puritan outgeneraled Genesta in this respect in 1885 it would certainly seem that Thistle is entitled to some credit for leading Volunteer in 1887, or if it was a smart thing to follow now it was no great blunder then.

Once away, the excitement became intense, as it was evident that all the desired conditions were this time present, and that the battle would be a fierce as well as a fair one. The course was a perfectly fair one, as free as possible from advantages due to local knowledge, out of the broad Atlantic, and with little to gain from tides or currents, plenty of deep water to choose a course in, and no great risk of outside interference. The wind was strong enough to insure a race, varying at times in strength and direction, but as it fortunately happened, favoring neither at the expense of the other to any extent; the sea was not heavy enough to trouble either boat, and while it would have been fatal to a shoal sloop it had no effect on such a deep and heavy boat as Volunteer. We have taken exception to the weather in which all the Cup races of 1885 and 1886 were sailed as fluky and unfair, but this time the conditions were fully above the average of yachting weather, and fair to both yachts. With the two starting so evenly and the fleet following behind there was every opportunity for an hour to compare them, but that length of time was not necessary. The first quarter of the hour told the story, and showed clearly enough that the keel had missed it again.

With two big cutter-rigged boats, similarly built and ballasted, differing little in displacement and carrying sail equally well, the question was narrowed down mainly to one of keel vs. board, and from the start the victory was entirely on the side of the latter. Taking the boats detail by detail as they sailed, each the acknowledged champion of her class, the easy victor over all others of her kind, the final effort of the leaders in design and seamanship, the comparison is by far the most important that has ever been offered, the opportunity for a substantial addition to the stock of knowledge now at the disposal of the naval architect is too great to be sacrificed to any partisan feeling, and we shall try to weigh each boat fairly and impartially.

First, and of the most importance, is the question of windward power, of holding on and going ahead, the quality of all others to be prized in a yacht. In this the odds were all in favor of Volunteer; she held out to windward and footed at the same time in a way that made the result certain in a few miles. While not at her best on this point, Thistle may still be taken as a standard for her class to-day, the equal of Irex to windward, though not quite up to Marjorie. Compared to her Volunteer's ability was undoubted, beyond the chances of change by any alterations of trim or sails. As they stood onward on the same long tack, under the same sails and in the same wind, the distance between the two constantly and steadily widened, until, from Volunteer being a hundred yards to windward by virtue of her luff at the start, she had the better by half a mile at the end of an hour.

Sailing the same course there was not much difference noticeable in the pointing, what there was being in Volunteer's favor, but the gain in this respect was slight. In carrying sail the advantage was the other way, contrary to the general expectation Thistle stood on her pins better than Volunteer. The difference in angle of heel as the two were viewed from astern was slight, but all in favor of Thistle, and if Volunteer had sail enough it seemed that Thistle could well stand more without exceeding the other's angle of heel. Comparing the canvas of the two Volunteer was ahead, excepting her jib, which shook badly while she was on the wind, but for the other sails they were all asleep, each doing its work quietly and effectually, trimmed flat, in fact the mainsheet-leave hard down over the narrow quarter, but each full, round and solid looking. Thistle suffered from a very bad foresail, the leech slatting continually all the way out. The jib was better, while the mainsail was doing its work well, though much has been said about the flapping of the leech. There was at first, for a short time, the flapping that is so often seen in the peaks of the loose linen mainsails, but this soon ceased, leaving only an undulation of the entire lower part of the sail, a rise and fall of the sail that was probably due to the motion of the boom, which was not sheeted in as on Volunteer, and which had more motion as the boat rose and fell. This, however, looked worse than it was, and probably affected the speed very little, as the sail was always full. Taken altogether, however, the whole sit of the canvas on Volunteer was superior to that of Thistle.

As the two reached along seas abeam it was difficult to distinguish any marked difference in the performance, nor was there any more when on the offshore tack they headed the sea. Neither suffered much from the moderate wave motion nor did the speed differ greatly, whether with the sea ahead or abeam. As to speed through the water, there was no perceptible difference. It is very hard to say which of two boats is going the faster when they are some distance apart and the spectator is first astern and then ahead on a swiftly moving steamer, and various opinions were expressed at times; first that Volunteer was overhauling Thistle in the footing, then that Thistle was holding her own, etc. On the way home the general opinion among Volunteer's friends was that she was outrunning Thistle easily, but the times proved to the contrary. All the way to windward Thistle showed as good speed on end as her rival, what best her was the inability to hold to windward. Of course it sometimes happens that the best boat at reaching will travel fast enough to make up for the lack of weatherly power, even on a windward course, but no such disparity exists among the best of the big class, Volunteer, Thistle, Mayflower and Puritan, and a marked inferiority in holding on cannot be made up by going faster through the water.

Shortly after the start the fog closed in a little, but after a time it lifted, and at 11:30 the rain began again, the wind holding about the same. At 11:45 the yachts were abreast of the big hotel at Rockaway, Volunteer now ¼ mile to windward but abeam of Thistle. The sun now showed a disposition to witness the race, and the sky and horizon were comparatively light. The first tack of the day was made by Thistle at 11:49, Volunteer going about at 11:51. They were now heading the sea, and both pitching a little. The difference between them was more plainly seen, and was too great for Thistle to make up with started sheets. At noon a heavy cloud rose in the east, being preceded by a comparative calm, but out of it came a streak of stronger wind from E. by S., breaking the yachts off a little. After this the wind went back to the old quarter, about E., holding there and increasing in force until near the finish of the race, when it went again still further to the south.

The steamers had run up near Thistle, and with the entire Atlantic to steam in some showed a disposition to crowd her, the Sirius being the chief offender. The flagship, setting an example by standing at a distance, whistled until they withdrew, without interfering with the yacht. There was plenty of space for them, and no possible excuse for any crowding.

At 12:48 Volunteer went on starboard tack inshore, with Thistle following at 12:51, the wind then being very light. At 1 P. M. Volunteer was off Long Beach, and over a mile ahead. At 1:25 she sent up the clubtopsail, more in readiness for the run home than because she needed it, and Thistle followed with hers at 1:30. At 1:37 Volunteer tacked again, Thistle going about at 1:41. Volunteer held this tack until 2:00, when she went on starboard, Thistle following five minutes later. Electra was now at the mark and

Volunteer soon came up to her, tacking at 2:25 just at the mark, rounding, and starting sheet, with boom to starboard. Her spinaker boom was hoisted after she tacked and some time was lost in setting the sail, it being sheeted home seven minutes after rounding. Thistle fetched some distance to leeward of the mark, tacking at 2:30 for the last time. She came up with spinaker boom on end, dropping it neatly as she squared away and sending the sail to the masthead and sheeting it home in three and a half minutes.

The times thus far were:

	Start.	Outer Mark.	Elapsed.
Volunteer	11 40 50¾	2 26 40½	3 45 49¾
Thistle	10 40 21	2 41 00	4 00 39

Volunteer's gain was 14m. 49¼s. in a beat of twenty miles. It is a safe rule in yacht racing to mistrust the accuracy of the times when seconds are split, as such close timing is seldom possible; but in the present races, with but two boats and the markboat at anchor, the times were taken with the utmost accuracy, the sights on the Electra's compass being used to mark the line. There were at the mark about thirty vessels—steamers, tugs and steam yachts—all of which gave the usual salutes to the racers, and then started for a race home. Only the faster ones arrived in time for the finish, unless, like Mohican, they did not run all the way out, but watched the turn from a distance, starting home ahead of the yachts.

Volunteer set her balloon jibtopsail at 2:50, then lowered working topsail, leaving club in place. Thistle set her balloon jibtopsail at 3:05. The difference in the setting of the sails on the two boats was most marked. Volunteer had her spinaker set so far forward as to throw the wind into the balloon jibtopsail, the latter being full and round like the spinaker. Thistle's spinaker was closer in to the mast, while the balloon jibtopsail was sheeted well home, like an ordinary headsail, not bellying to the wind as Volunteer's did. As they ran home at a round pace there was much speculation as to which would make the run in the least time, and Volunteer's friends maintained that she was leaving the other, though it was impossible to form any accurate judgment. At 4:07 Thistle took in her spinaker, as the wind had gone a little too far to the south, and Volunteer followed about four minutes after. At 4:15, when Electra anchored off the Scotland, the wind was E. by S. Volunteer came for the line with balloon jibtopsail and both headsails, while Thistle had her balloon foresail set, but jib in stops, beside balloonet. Of course both boats were greeted in the usual manner by whistles, guns, ensigns and cheers. The official times were:

	Start.	Finish.	Elapsed.	Corrected.
Volunteer	10 40 50¾	4 23 47	5 42 56¾	5 42 56¼
Thistle	10 40 21	4 35 12	5 54 51	5 54 45

The times each way compare as follows:

	Volunteer.	Thistle.		
Out	3 45 49¾	4 00 39	Gain, Volunteer	14 49¼
In	1 57 06½	1 54 12	Gain, Thistle	2 54½

Volunteer wins by 11.48¾

After the race the Haviland took Volunteer in tow and steamed for Bay Ridge, while Thistle sailed on up to Staten Island. The rain was falling again as the fleet started home, but the long suspense was over at last and both sides felt the relief. Volunteer was sailed by Captain Hall, with whom were Captains Terry, Berry and Jeffrey. Captain Elsworth was not on board in either of the races. In the first race Mr. Robert Wylie sailed on Volunteer to represent Thistle, while Mr. Geo. Clark took his place in the second race. Captain Barr sailed Thistle with Captain Gibson as pilot in the first race, but alone in the second. Mr. L. A. Fish of the Grayling, was on board in all the races as representative of Volunteer. During the races the steam yacht Oneida, owed by Mr. E. H. Benedict, did important service as a tender for Volunteer. In the evening there was a jubilee at the rooms of the New York Yacht Club, but Gen. Paine and Mr. Burgess were not present.

It is a subject for congratulation that the races have passed off without any hitch or disturbance or ill feeling on either side. That they have been so well managed is due entirely to the spirit and liberality of Com. Gerry, who has turned his steam yacht for the time into a committee and press boat, and to the Cup and regatta committees. This season has witnessed more races than any previous one and the races too have been more important and with larger entries, entailing an unusual amount of work, especially on the cruise. That it has passed off so well without disputes or protests, is due to the thorough manner in which the regatta committee has done its work.

One criticism has been made by the visitors on the conduct of the Cup races which is decidedly unfair. The regatta committe has been blamed for not starting the race at the hour advertised, wind or no wind. The custom in England of starting a race at the advertised time, no matter what the weather may be and then calling the race later if there is no prospect of a finish, has been quoted as a precedent, but the committee had a far better one before them in the races of the last two years. All the Cup races have been sailed with a time limit of seven hours, a matter that has even been objected to on the ground that it unduly favored the latter by preventing a drifting match, and which is certainly as fair for one side as the other. In order to sail the race in this time it has been necessary to have some wind at the start, and the custom has been to be at the line at 10:30 A. M., waiting until as late as 2 or 2:30 and then postponing the race to the next day if there was no wind. In this way it has often happened that a race is made in five hours of the afternoon breeze which is apt to freshen late in the day, when, if started earlier, as per programme, three or four hours would be spent in drifting, leaving but an hour or two in which to sail the race. The English method, if followed here, would be the most certain way of securing a drifting match, and would prevent just what both sides wish to see, a fair race in a breeze. Had the first race been started at 10:30 instead of 12:30 the yachts might have come out of the Narrows with the last of the ebb and finally caught an air outside, but nearly two hours would have been wasted in the drift, and the chances for a race would have been much lessened. Had Thursday's race been started on time there would have been a long and tedious drift, without result, and nothing would have been learned of the boats. In adhering to the present method the committee has merely followed a precedent which thus far there has been no reason and no authority for changing, and which seems better calculated to guard the interests of the challenger which must make an ocean voyage of three weeks than of a possible skimming dish built here to defend the Cup. The present method places much more responsibility on the regatta committee, as the question of the exact amount of wind at any time is apt to be an open one, and their decision is liable to be questioned by either party.

There is no denying the fact that such a defeat of Thistle is a serious disappointment to all friends of the keel boat, the side which the FOREST AND STREAM has so long championed, but if there is any satisfaction to be found it is in the fact that the result on Friday was beyond question, there were no drifts or flukes to make it uncertain, but the best keel boat yet built in the large sizes has been squarely beaten to windward by a boat with a centerboard. Not by a skimming dish, not by an American sloop of light displacement and no draft, but still by a boat in which, in addition to a big keel, the board forms a most important factor in the matter of lateral resistance. We might seek comfort in the fact that the skimming dish is no more, that the days of the American death trap have passed away, that the new boats in themselves embody the great principles of safety and seagoing qualities which we have always fought for, but these points, however important in themselves, do not fit the case just now, for it is through them that the issue of board vs. keel has been divested of outside considerations and fairly decided up to this time in favor of the board. We are not now arguing over the smaller classes, they can take care of themselves. What we have to say relates solely to the great racing single-stickers. No fight between different types could have been fairer than that of last week, the two yachts were the recognized heads of their respective classes, practically equal in length, sail area, displacement, rig, build and method of ballasting, but the one had a centerboard in addition to her lead keel, while the other carried a keel alone, but some 2½ft. deeper. The centerboard boat won, that is certain, and it is just as certain that she won on her merits, that no difference of area or perfection of sails, or any small improvement of trim or handling would have made up for the marked difference in holding to windward that was visible from the start. What little satisfaction is left to the friends of the keel is in the fact that the result was clear and unobscured by side issues, nothing was left in doubt, and we are all now squarely face to face with the question, "What are you going to do about it?" There is no feeling that Thistle is not the best of her kind or that she has not done relatively her best work compared with Volunteer, and as for the possibility that she might have shown better on a different course with less windward work, whatever bearing it may have on the ownership of the Cup it is entirely irrelevant as far as the main point, the superiority of the keel is concerned; that depends solely on windward work. No matter how fast on other points she may be, the best boat must prove her way to windward before the yachting world will accept her.

Hard as the defeat is to American cutter men, it is not entirely without precedent; they have been in the same place before, and propose to keep on until either the luck changes or they get to like it. On the other side, however, it has hit still harder squarely between the wind and water, if we can accept the comments in the British papers as an index of the opinion there. If it goes so far as to open British eyes to the fact that there is some merit in the centerboard, that it cannot longer be denied a place in British races and that any future expeditions for the Cup will be anything but picnics, it will do good, but it is not impossible that it may have a still more radical effect, and that the next step may be a trial of a board rather than a determined effort toward the improvement of the keel, a result we should be sorry to see. The work on Friday morning was a surprise and shock to many who witnessed it; even yet they have not settled just how it all happened, but the point most impressed on all was the work of Volunteer to windward, the power of the 21ft. of draft decreased at will, and the effect has been in no way lessened in the transmission under the Atlantic.

In this sudden awakening to the merits of the centerboard, it is very possible that its advantages may be overestimated, and that some earnest adherents of the keel may turn to the contrary belief, that a centerboard is a necessity for speed, whatever its drawbacks in other respects.

To us, however, familiar always with the good and bad points of the centerboard, and seasoned to defeats as bad as this by many long fights in the past for which we have in time been well paid by substantial successes, the matter wears a different aspect. There is no need of wasting time in idle speculations as to whether Thistle must have a centerboard, or whether the next challenger for the Cup must be a British copy of Volunteer, we are content to acknowlege a fair beating, and without further loss of time to look for a means of retrieving it. What we have to say is in no way an excuse for the past, the keel boat has been beaten by a centerboard boat, we admit it freely, now why was it, and can it be retrieved? The two boats stand to-day the best efforts of the acknowledged masters of the craft, and as such it is admissible to consider whether each represents the highest developement of its type. In Volunteer we believe the highest possible developement of the type, as far as dimensions and elements go, has been reached. On her length it is impossible to see how any refinination of the process of evolution that has wrought her from Puritan is possible. In depth and displacement no further addition can be made without throwing her into the same category with Thistle, but with a board added. One step there is, but this it is very unlikely that Mr. Burgess will take, and it is to be hoped that he will not, a big Pappoose with great beam, light bilge and the huge sail plan which the New York rule would permit of, but with the proportionate draft of Pappoose, somewhere near 18ft., cut down to a practicable limit by the aid of a board. Such a craft would be most formidable, but we should be sorry, in the interests of yachting, to see her built. It may be that Volunteer is good enough to hold her own for at least a couple of seasons without a new boat being built, but this is hardly probable; and if she is to be outbuilt next year by what would seem to be a natural improvement in build and model. As to build, while she is far from perfect in many respects, any possible improvements would not much increase her speed, while in rig and fittings the margin for improvement has been cut down each year, until there is comparatively little left to work on. The only other point for improvement, then, is form, and whatever may be done here it will hardly help her to windward much, though it may off the wind. It would seem, then, that the field for any great improvement in Volunteer is limited. No doubt another season in the hands of General Paine and Mr. Burgess would see her in still better form, or if they were called on to beat her they might succeed; but the task would be a far different one from that of last year in beating Puritan and this year in doing the same with Mayflower.

Looking at the other side, it is more only a question of beating the Burgess boats and taking the Cup with a keel boat, it would probably be possible to do it with a huge Doris, a light steel shell with unlimited draft, ballast and sail, but such a boat would be a most useless machine, far beyond the limits of practical yachting, however fast she might be; and her construction and possible success could serve no good end, and would be time and money thrown away. The value of depth has been already taught by the smaller boats, and such a vessel could teach no new lessons.

Given unlimited depth and the thing can be done, but in hard practice the problem is brought down to much narrower limits. For all the purposes that a yacht must serve, even a racer pure and simple, the maximum draft may be taken at 14ft. If this can be lessened so much the better, but it cannot be exceeded without infringing on a fixed limit, the few available harbors, the courses usually sailed, the docking facilities, even of the larger ports; and if the keel boat cannot do with this draft, then its inferiority to the board in practice must be conceded. Applying this test to the Thistle the question arises, can she be improved in the one point in which she is lacking, and yet retain her good qualities?

With rather less sail area than Volunteer, but carrying her sail proportionately as well, Thistle is faster running and reaching, and fully as fast through the water when on the wind, or even allowing that she profited any by bringing up more wind on the run in, she held Volunteer in the footing to windward, and ran her coming in free. Thistle then is the equal of Volunteer in all respects but one, and though that is the vital one from a yachtsman's standpoint, it may be capable of improvement. Her stability, or speed through the water, and in general performance, Thistle is the equal of her rival; what she lacks is the power to hold on. Her draft has been variously stated as from 13 to 14ft., but the former we believe to be very near the correct figure. Genesta's was 15ft. with 5ft. less length, while Galatea's was 6in. more. Thistle's performance has been such as to demonstrate that in cardinal dimensions, in displacement, she is not radically wrong but that she is a very fast boat, and the question of her possible improvement is narrowed down to one point. A substantial addition to the area of lateral plane is possible, either with a greater draft but still within the limit we have indicated, or by an altered form under water with little more draft. Thistle has one feature carried to an excessive degree, the reduction of forefoot and of the mean draft of the forebody. An increase of lateral plane here, perhaps helped by a straightening of the sternpost, might give the required area without too great an increase of resistance, or if this is not enough, extra draft, to the extent of nearly a foot, might be combined with it. If the required power can only be had by virtue of a greatly increased draft, say 16 or 17ft., then it must be admitted that the type represented by Volunteer is the best for racing, but the time has not come to admit this yet, there is still a wide and clearly indicated field for improvement, and Mr. Watson is not the man which his work thus far would show him to be if he does not soon push into it, without a thought of the adoption of the centerboard.

Already, out of the indefinite rumors that have been afloat for the last few days, comes the certainty of at least one challenge for the Cup and of another series of races for next year. Now, while the holder in the present position of vantage after defending the Cup with credit in the three successive encounters, is the time to consider the conditions under which it is held, and whether any change in them is desirable. Should it so happen that the Cup changes hands and the present holders are obliged to look at the reverse of the deed of gift, it will perhaps appear in another light; but it will then be too late to make any changes.

In the days of the first challenges the old deed of gift was looked upon largely as an instrument devised to keep the America's Cup in the possession of the New York Y. C., and was interpreted accordingly. Year by year, in deference to strong outside pressure, concessions have been made, precedents have been established and the deed of gift itself has been remodeled by the trustees, until the races in the tables in the estimation of the yachting world, as much so as a sister cup now held abroad under restrictions which debar American yachts like Mayflower and Volunteer. As more liberal terms have been made the America's Cup has risen in value, until from a mere relic half a dozen years since, it has become what its donors intended, the emblem of national supremacy in yachting, held for three years in succession against the best that could be sent to take it.

The benefits which have arisen from the late races are beyond question; the awakening from the old delusion that the American skimming dish was invincible, perfect in all respect; the construction of a new and totally different type of vessel, infinitely superior to the old; the extinction of the type whose fatal disasters were a national disgrace, the awakening of a wider interest in yachting, not only among yachtsmen, but throughout the nation, leading as it must to a stronger feeling of pride in the pleasure navy, even in parts remote from the water, and fostering the national interest in water sports. All of these advantages are undisputed, but still it can do no harm to consider whether the Cup is doing all that it is capable of, whether the altered conditions of yachting within the last three or four years are fully met by the present reading of the deed of gift.

As far as the challengers are concerned, the late races have all been conducted on a very fair basis, both sides have entered the contest amicably and in a friendly spirit, and no disputes of any moment have arisen. It is only from a home point of view that the question should be considered in order that the greatest possible benefit should accrue to American yachting. The old idea of a regatta is pretty well exploded among yachtsmen; the conditions of modern yacht racing call for the closest possible matches between picked boats, sailing on perfectly equal terms, in all international contests; and the sooner the last vestiges of the regatta idea are stripped from the Cup races the better for all. Such a steamboat show as the first race is only disgusting and disappointing to yachtsmen, however pleasing to landsmen out for an excursion; what is wanted is such a race as on Friday, a clear field for the best boats; and as long as the Cup is retained by such races American yachtsmen may well feel proud. In order to make the battle what it should be, a fight to the bitter end between equals, it is evident that some arrangement is necessary in order to insure a reasonable agreement in the principal factors of speed. By chance this year the two rivals were of the same corrected length, time allowance was eliminated from the contest, and the interest and excitement were greatly enhanced thereby. Had the Thistle been but 70ft., with a big allowance from Volunteer, the Cup might have been saved as surely, but the race would have lost interest and in value. The tendency has been to outbuild each year, Puritan 80ft., Mayflower 85ft., Volunteer 90in. longer, Galatea and Thistle over 86ft., and the indications are that the same process of outbuilding will continue on each side, until the extreme limit of size of singlestickers shall be reached.

As long as the challenger must give his dimensions six months in advance, the advantage is to a certain extent on the side of the present holders, as they can at once outbuild him by a few feet. This however is an advantage which every true sportsman would despise, as a race won by mere size, or through crudities in rules or allowance tables must bring little honor. To eliminate this, the size should be a matter of mutual agreement, to be settled as long in advance as desirable by the challenger and holder, a plan that is certainly as fair to one as the other. This brings up the question we touched on last week, the waterline length vs. tonnage. It is in every way desirable that such a document as the deed of gift should be free from changes and meddling and as nearly permanent as possible, and after some years of trial it would seem that it meets the case excellently, and that no radical alteration in the wording is called for. If the points we suggest are deemed desirable they can be adopted without any alteration in the deed, as they are clearly permitted by the fourth article. By the provisions of this clause all conditions may be mutually agreed upon by challenger and holder at any time, a proceeding much more in accordance with all modern ideas of sport than the present unsatisfactory condition of affairs, one side waiting for the other to show its hand and then starting in to outbuild, as in 1881 with Pocahontas and Atalanta.

If the present state of affairs continues each nation must maintain the effort to outwit the other in the matter of size, unpleasant consequences are likely to ensue, the value of the races must at times be thrown away in consequence of a marked disparity in size between the competitors, and much of the good results must be lost to both nations. The contest thus far has resulted in the production of a class which we believe is too unwieldy and expensive to be permanent, and in a year or two we shall see still larger and more costly vessels if no measures are taken to limit the size. It is settled that the club will at once have a new challenge on its hands. Before it comes would it not be well to consider fully the points here presented, the mutual agreement in good season on the class to be raced, and the final settlement of the question that has come up for the first time this year, whether the waterline length is required? While for the reasons given last week we believe that the waterline length was not included in the term dimensions, it is perfectly plain that it should be, and now there can be no objection to demanding it, letting the tonnage clause stand as it is, a matter of no consequence either way. Just now this would work to the advantage of the holders, as what they most want to know is the waterline length, but the challengers are little likely to make any objection to such a permanent change. Some day the same thing may work to the advantage of an American challenger, for in spite of many defeats it is tolerably certain that Britain's blood is raised, and that the effort will be maintained until she regains the Cup. However unlikely such a contingency may seem just now, it is easily within the bounds of possibility, and if it does happen the interpretation of the deed of gift by the New York Y. C. must form the precedent for the new holders.

In regard to an agreement to race boats of a certain size only for any specified race, the argument has been advanced that as trustees under the deed of gift the holders have no option in the matter, but it is their duty to meet the challenger with the boat which is most certain of winning, regardless of size, or in other words, if Thistle had been but 70ft. long, it would have been the duty of the club to put Mayflower against her. However true this may be from a legal standpoint it will find little favor with all true sportsmen, as the chances of a fair race would be entirely barred; and further, as a mere matter of policy it would furnish a very bad precedent and offer a premium on outbuilding rather than outsailing, something that no one wants to see.

From the yachtsman's point of view the deed of gift is capable of a far more liberal interpretation, one that is much more in accordance with the spirit and patriotism of the men who first won and then dedicated to its present work the America's Cup. The end for which the Cup was given is the advancement of American yachting; the means to this end is through international contests. To retain permanently its value, it must be raced for on equal terms and won fairly by superior sailing. Further than this, however, it is the most powerful instrument for the improvement of its fleet ever placed in the hands of any club, and however well defended, the club is not doing its full duty until it so shapes the races as to secure the best results to its fleet.

In times past the unstable condition of racing and the absence of clearly defined classes made this point of little importance; but yacht racing here and abroad is becoming more thoroughly systematized each year, and it is already a discredit to the clubs in this country that they do not unite in an earnest effort to hasten and advance the process of improvement that is now going on but in a shiftless and indefinite manner. No better instance of this can be found than in the case in point, the late races for the Cup. It has so happened that, without design or concerted action, a new class has grown up from the Cup contests of the past three years, a class which we believe was uncalled for, and which will not become permanent. The class was called into existence by a challenge from a yacht of 81ft., or larger than any American single-sticker, so that it was necessary to build to that size, and now it numbers five yachts. The necessity for its creation, in view of the size of the challenger in '85, and the reasons for its growth since are apparent enough; but it is time now for yachtsmen to consider whether it is a class that should be maintained, or whether more good to yachting at large will not result from a return to the smaller classes. The immense influence of the international races is seen in the fact that in three years five large and comparatively costly yachts have been built, while since the previous contest in '81 but five additions have been made to the former favorite, the 70ft. class.

The new class is undesirable, first from the expense and time required to race such boats in proper form. It means upward of $50,000 to bring such yachts as Volunteer and Thistle to the line for the first race, and after the expenditure of this or a larger sum, by the end of the season the boats will not realize more than 40 to 50 per cent. There are plenty of yachtsmen who are well able to afford the money, but there are very few who are willing to do so. The older and wealthier are little inclined to give up an entire season to such hard and constant work as Gen. Paine has put into Volunteer this year and Mayflower last, they go into steam as a rule, or they take to a large schooner, in which room and comfort are far more easily had than in even Mayflower or Volunteer and at much less cost, concerning themselves with what racing there is in the schooner class. Of the five yachts now composing the class some are already outbuilt, and not one can hope to win prizes from Volunteer under her present ownership, so they are practically out of the racing. What then is to be done with them? The cost of keeping a trained racing crew, of frequent docking and painting, of new sails and spars, is too great in proportion to the races they are likely to win in a season, and if cut down to cruising rigs and crews they would be better as schooners.

It is becoming generally recognized that the fastest racer is not the best cruiser, but still yacht racing has not yet reached a point in this country where a special racing class can be maintained, and the yacht demanded now is one that can be raced in the regular events of the season, perhaps eight or ten races, without maintaining all the time a large racing crew, and that offers at the same time fair accommodations as a cruiser and for ordinary summer yachting. The favorite yachts for this work have always been from Mischief, 61ft., up to Bedouin and Gracie, 70ft., and it would seem that one of these two sizes or somewhere near to it was the most worthy of encouragement by the clubs. Last year the more chance of a challenge from a boat in this class was the cause of the addition of two new yachts and the refitting of one old one in it, and had the opportunity been seized then there might

have been half a dozen fine yachts added. There are plenty of men to-day who would be glad to build for the trial races, but who cannot afford a first-class boat, even if certain of success, as she would be too expensive for their wants afterward.

It may be urged against the restoration of the Cup races to the smaller classes that the chances of the keel boat are better than in the first class, as depth is much more effective, but as far as winning the Cup is concerned, if depth and draft will do it in one class they will do it in another, though at a greater cost, but in such a case money would be of no importance to the challengers. On the other hand, if it should be agreed on now to limit the race to 70 or 75ft., there would be no lack of boats ready for the trial races. Another consideration, too, comes in here, suppose the next challenger is of 85 or perhaps 90ft., and Gen. Paine gets tired of the sport, who will or can take his place? The possibility is by no means unlikely, he has won for three years in succession and has little left to win, the work he has done has been both arduous and costly, and he can retire at any time with perfect propriety, in fact it would be better for American yachting if he left the defense of the Cup to others and took Volunteer abroad after the two cups there. It is plain to all that but for his efforts the Cup would be on the other side now, there is not another yachtsman in the country who both could and would do what he has done for three successive seasons, and it is too much to expect that he will go on indefinitely. Should he be ready to build for a fourth time it may be best to hold to the big class as far as the safety of the Cup is concerned, but should he withdraw, the advantage of having a large number of boats in a smaller class from which to choose a defender will be apparent.

To sum up then, the proper carrying out of the spirit of the trust confided in them requires that the holders of the Cup take into consideration whether the present influence of the races is the best for yachting, whether the present first class is desirable, and to be retained; if not, which size will be the best. If it be decided that a change is advisable, then the faulty and inadequate classification of the club will need attention, and the selection of one class for the international races will have to be settled. The manner in which the races have been managed this season is a sufficient indication that the New York Yacht Club is alive to the importance of the trust held by it, and that the intention is to carry out the spirit as well as the letter of the deed of gift, and in submitting the above considerations we do so with every confidence that they will at least be weighed by the club and condemned or accepted only after full deliberation and discussion.

THISTLE TO WINDWARD.

Editor Forest and Stream:

I would like to add a few separate remarks to my review of the Thistle races. Although venturing upon a criticism of her lateral plane and gripe, I do not wish to have my review accepted as even a mild indictment of Mr. Watson's ability, and still less as a direct charge of a palpable error for which he should be held responsible. Nobody realizes more than I do how much easier it is to find fault and issue directions *after* the results have made the case clear. Despite her failure to point and fetch with Volunteer the Scotch yacht must be conceded a masterpiece, second only to the latest Burgess boat, and it is a question whether any one can guarantee superior performance. My object is only to contribute a rational explanation of her sailing according to such light as I possess, recognizing that Mr. Watson is quite capable of paddling his own canoe and that opinions from him to the contrary would be entitled to the fullest weight.

When Thistle was docked the very first impression I received was that she lacked in lateral resistance, and with no gripe and a long flaring bow above water would be apt to sag and fall off, particularly in a seaway. Her tests on the other side were not crucial, since the yachts she met were so much inferior in other respects, that Thistle's own faults failed to appear by contrast. The recent races seem to confirm my first impression, and I have no doubt that Mr. Watson will be able to meet Thistle's deficiency in his next venture. It has been shown in the Thistle races "that it can be done," and despite the enthusiasm of our own people over the Volunteer's victory, British bulldog persistency will yet manage "to do it," unless we meet John Bull with one of his own tools.

C. P. Kunhardt.

AFTER THE RACES.

Messrs. Paine and Burgess returned to Boston on Saturday night, after a reception by the New York Y. C. A grand reception will be given them in Faneuil Hall to-morrow night. Messrs. Bell and Watson have been in New York, some of Thistle's party are preparing for a trip up the Hudson in the Mohican. Most of them sail for home by the City of Rome on Oct. 12. Volunteer left on Tuesday for Marblehead, where she will anchor for a few days, all visitors being freely admitted on board by Gen. Paine's orders, after which she will lay up for the season. Thistle is still off Staten Island, but will probably lay up soon at Manning's Basin for the winter. She is for sale, as the owners wish to clear up accounts. Mohican will stay in New York until spring, when her owners will make a trip to the West Indies in her. There has been an effort on the part of the Larchmont Y. C. to get up a race for all the first class, including Thistle and Galatea, but it is not likely to take place.

A rumor is current of a challenge from Mr. Wm. Muir, of Dumbarton, Scotland, and also of one from the Royal Nova Scotia Y. S., but in the meantime the following letter has been received by the secretary of the New York Y. C.:

New York, Aug. 30, 1887.—*John H. Bird, Esq.:* Dear Sir—I beg to inform you, as representing the New York Y. C., that it is my intention to challenge for the America's Cup, and that the formal challenge with the documents and particulars required by the deed of gift will be forwarded as soon as possible. The yacht will be owned by myself and another yachtsman.

As the position of a challenger may be considered antagonistic to the club holding the Cup, I think it right to tender my resignation as a member of the New York Y. C. I do so with much regret, as all my relations with the club have been of a most pleasant nature. I am, very truly, Charles Sweet.

Mr. Sweet is well known as a Scotch yachtsman, a member of several English clubs, and resident for several years in New York, where his business is partly located. He brought out and now owns the cutter Clara, so successfully sailed here by Capt. Barr, and is a member of the Seawanhaka, Corinthian, Larchmont and Eastern, as well as the New York Y. C. While no necessity for his resignation exists, and it is not likely to be accepted by the club, Mr. Sweet has tendered it as above. Nothing definite as to the proposed boat is decided on, but Mr. Watson will design her. A movement is on foot for a testimonial in the form of a cup for Gen. Paine and for a national purse to be presented to Mr. Burgess, the New York Y. C. contributing $500 toward each. A meeting of the club was held on Monday night, at which the following important resolutions were passed:

Resolved, That a committee of five be appointed by the Chair to confer with Mr. George L. Schuyler on the subject of amending the deed of gift of the America's Cup, and with full power and authority to execute in behalf of the club any and all papers and instruments necessary to effect any changes in such deed of gift and the acceptance thereof which may be mutually agreed upon between them and Mr. Schuyler.

Resolved, That $500 be appropriated for the purchase of a suitable testimonial to be presented to Captain Charles J. Paine by this club as a grateful recognition of his unequalled skill and ability in thrice defending its possession.

Resolved, That a dinner be tendered by this club to Captain Charles J. Paine and Mr. Edward Burgess (to take place at such time as may be most agreeable to them) as a mark of its appreciation of their enterprise, talents and genius so conspicuously displayed in the interests of American yachting.

Resolved, That subscriptions to such dinner be open to all members of this club upon such terms and in such manner as a special committee, consisting of the flag officers, the secretary and treasurer and the chairman of the Cup, regatta and house committees, shall determine, and that the arrangements for such dinner be intrusted to such committee, with power.

Resolved, That the thanks of this club are justly due to the Board of Commissioners of the Municipal Police of the City of New York and to their skillful and energetic officers in charge of their patrol boat for the very efficient services rendered by them to the club in keeping the course clear and preserving order during the recent races for the America's Cup.

Resolved, That a reception be tendered to Vice Commodore Bell, of the Royal Clyde Yacht Club, the owner of the Thistle, to be held at the club house at such time as he may designate.

Resolved, That the treasurer of the club be directed to contribute in its behalf $500 to the national subscription recently inaugurated as a testimonial to Mr. Edward Burgess, designer of the Puritan, the Mayflower and the Volunteer.

The committee was afterward appointed by the Commodore, as follows: Ex-Commodore James D. Smith, Charles J. Paine, Philip Schuyler, Governeur Kortright, Latham A. Fish and Commodore Gerry.

After waiting to witness the races Galatea will sail for England this week, with Lieut. and Mrs. Henn on board.

AN EXPERT REVIEW.

Editor Forest and Stream:

Summarizing and interpreting correctly the recent international matches is fortunately an easy task, for the races admit of clear and incontestible conclusions.

The first trial was over the "inside" or New York Y. C. course, which has been shown time and again to be unreliable, unfair and impracticable, but which will continue to figure in international records as long as the present unenlightened element sways the destinies of the club acting as trustee of the Cup.

It is admitted on all sides that there was a great deal of fluking in the earlier work from start off Owl's Head down to Southwest Spit. It is also admitted that the fleet of nearly two hundred accompanying steamers proved a greater nuisance than ever, and that the two racers were seriously hampered by their reckless interference, which at times amounted virtually to a blockade.

There will be differences of opinion as to the extent to which each of the yachts suffered, but there is only one opinion concerning the impracticability of insuring an unobstructed course over the stretch mentioned.

To reach sound deductions, the work from start down to the Hook must be omitted from consideration, the sailing being too much checkered by the slants and the promiscuous harrassing of the steam fleet, some vessels, I regret to say, acting in a manner which was nothing short of vicious and shameful. And among these vessels were steam yachts flying the burgee of the N. Y. Y. C.

From black can No. 5, off the point of Sandy Hook, out to the Lightship for the turn and all the way home to the finish, the racers were comparatively free from annoyance by steamers, and had something like an even wind. Approaching the finish, however, Volunteer was again badly hampered by the headlong rush made by the steamers to fetch up at the finish in advance. Of this due account will be taken in the following:

FIRST MATCH.

Tuesday, Sept. 27, N. Y. Y. C. course. Wind light and variable with calms at start, settling into light southeasterly breeze during work out to Hook, and veering into southward during last third of race. Sea smooth.

Throwing out the first part of the race, which was no race at all, but a gross travesty, the Thistle having to box about, hunting for the Southwest Spit buoy hidden among the steamer—we will pick up the flyers as they pass buoy No. 5 off the Hook and follow them out and home again. The times at different points were as follows, buoy No. 10 being the Spit.

	Buoy 5, off Hook.	Lightship, the round.	Buoy 5, on return.	Buoy 10, on return.	Finish, Buoy 15.
Volunteer	2 44 30	3 42 12	4 23 30	4 26 00	5 28 16
Thistle	3 03 00	4 01 15	4 40 30	4 53 00	5 45 53
Differences	19 30	19 03	17 00	17 00	17 37

The above table is official only for Lightship and finish. Other times are taken from the most reliable accounts published. They are sufficiently correct for the purpose.

The distance from Hook around Lightship and home is scant two-thirds of the entire course, the first third being disregarded for reasons stated.

We find, then, that at Buoy 5, off the Hook, Thistle was 19m. 30s. astern of Volunteer. Out to the Lightship it was a good rap full, both being able to fetch the mark, so that the demands of extremely high pointing and fetching did not come into play, the stretch being only an issue in respect to "footing." At the Lightship the distance between the yachts was 19.03, or 27s. less. This gain of the Thistle is too slight to be deemed of any practical import and both craft can be set down as *just equal by the wind.*

From Lightship back to Hook it was a broad reach, with big jibtopsails and booms wide to starboard. Thistle reduced the distance from 19.03 at the turn to 17.00 at the Hook, a material gain of 2m. 3s. That is to say, *on a broad reach Thistle was the faster boat.*

From Hook in to Buoy 10 on Southwest Spit, it was again nearly a close haul for both craft. The same distance was maintained, so that once more *by the wind both yachts showed the same speed.*

From the Spit up Ship Channel to finish it was a free run under spinnakers. The distance of 17m. was increased to 17m. 37s. at finish, a trifling loss of 37s. for Thistle, but too small to have any practical meaning. Therefore, *down wind both yachts displayed the same speed.*

The total gain for Thistle in all this work is the difference between 19.30 at Hook going out and 17.37 at finish, or 1m. 53s. But, as above mentioned, Volunteer had her wind split up by the steam fleet to a greater extent than Thistle, and the latter suffered most from the broken water they left in their wake. How much allowance is due to each yacht on this score no one can tell. It goes to show the absurdity of arranging a match over such an unsuitable course. Let us allow the gain of Thistle as an offset to Volunteer's loss of even wind. It is as near an estimate as can be offered. Then there remains these notable facts:

1. From Hook out and home, *by the wind, on a reach and down the wind, Thistle is at least as fast as Volunteer.*

2. *No gain in practice resulted to Volunteer from tricing up her board down wind*, however truthfully such a gain may be argued in theory. There are evidently concurrent disadvantages, whether in the slosh of water in the casing, the tearing apart of such water from the body of water below, or in the form of the vessel herself called for in models adapted to the use of the board.

But "one swallow does not make a summer." Neither does one race demonstrate anything beyond question. Fortunately the foregoing observations were strengthened beyond dispute by the lessons of the second match over the outside course, practically free from fluke and interference.

SECOND MATCH.

Friday, Sept. 30.—Course twenty miles to windward and return; start from Scotland Lightship; turn abreast New Inlet, Long Island, three miles off shore. Sea smooth, with moderate jump during latter half of race. Wind fairly steady, E. by N.; average strength 18 miles.

It was almost a dead beat out and spinakers home until nearing finish, when a southerly vein to the wind compelled them to come in and balloon jibtopsails were set instead. Fair and conclusive race in every respect.

In the windward work from Scotland to the turn Thistle was badly beaten as under:

	Start.	Turn.	Finish.
Volunteer	10 40 51	2 26 40	4 23 47
Thistle	10 40 21	2 41 00	4 35 12
	Minus 30s.	14 21	11 25

The above table is official. Fractions of seconds are not considered in these times. Thistle got away 30s. ahead. At the turn, she was 14m. 20s. astern. She had been beaten in the thrash by 14m. 50s. This is a round beating and deserves careful examination.

All accounts, and there were scores of them published, agree clearly that Thistle *footed* just as well and if anything a little faster than Volunteer. All likewise agree that Volunteer got in her work through *higher pointing and better fetching.* The trouble with Thistle was, then, not lack of *speed through the water*, but lack of "weatheriness." That is, she failed to "hang on" like Volunteer, and fell to leeward hand over fist in comparison.

On the run home, Thistle made up the difference between 14.20 and 11.25. She gained down wind and reaching 2m. 55s. Allowing that this does not truly represent superiority but was incidental to the "safe and sure" policy pursued on board Volunteer, it will be conceded that once more Thistle proved herself at least as good as the Boston flyer with "pointing and fetching" eliminated from the issue. Thus, with free sheets, the results of the first match are confirmed, and:

1. *Thistle is as fast through the water as Volunteer.*

2. *Thistle fails in fetching and pointing.*

Two definite conclusions are warranted from the foregoing:

A. There is nothing wrong about the hull of the Thistle. Considered as a *type* of vessel, she has shown herself capable of attaining the highest rate of speed *through the water* yet reached by any American model, or modified American model like Volunteer.

For, be it remembered, that *type* is not a matter of mere outline, but of main proportions, volumes, weights, and rig. Thistle's sailing with free sheet demonstrates beyond cavil that her hull, her body proper with its moderate beam, large displacement and loaded keel can be driven *at the same speed* as Volunteer's lighter body, and that with *less canvas.*

B. The capacity to "point and fetch" does *not* depend upon the *type* of a vessel, but primarily upon the *plane of lateral resistance and its distribution.*

Thistle is manifestly deficient in the *area* of her lateral immersed plane for one thing, and for another, its distribution is not calculated to attain the best results. This fault is a *specific shortcoming*, which has no connection with *type.* It is a shortcoming frequently noticed in boats of *any* type, and can be found in sloops and half-breeds just as well as in the regular cutter. Had Volunteer been deficient in lateral area, had she been cut up too much from heel of post to forefoot forward, she too would have failed in high fetching just as we have seen Thistle do, and such a fault would have been *purely specific*, and not a vice inherent in Volunteer's type of body proper.

It is not intended here to offer "excuses" for Thistle's defeat, and I trust the reader will not look upon this review in such light. It is sought to obtain a true explanation of the causes which led to Thistle's failure, in order that cause and effect may not be confounded, which would only become a clear understanding for the future and create false standards.

Thistle did *not* fail in looking and holding as high as Volunteer because of her *type*, nor yet because of her *keel.* She failed for want of *sufficient* lateral area and its *best* distribution.

Volunteer did *not* succeed in looking and holding higher because of her *type*, nor yet because of her *board.* She soaks a-weather because she is supplied with *enough* lateral resistance and because it is distributed along her length to *best advantage.*

The difference between the two yachts in respect to climbing to windward is one of *quantity* of lateral resistance and not one of the mechanical *devices* adopted in providing it. Least of all has the question anything to do with the type of the hull. There is no connection between form of body and area of lateral resistance, since the latter is at the command of the designer to any extent he wishes in yachts of any kind.

CONCLUSION.

It appears most likely that in seeking to minimize area of skin exposed to friction, the lateral plane and gripe of Thistle have been cut down below the requirements for "high fetching" in a yacht of her large displacement and roundish middle body.

That skin friction plays a part in resistance no one will deny, but it is the general belief in America that while the skin should be as smooth and slippery as possible, too much stress is laid by British designers upon the area exposed, and they put too much reliance in data which are largely speculative so far as yacht models are concerned.

Thistle is for sale and it is to be hoped she will fall into the hands of a fighting and intelligent person.

Given 6in. more draft—it is now only 18ft. or thereabouts—and carry the keel along further forward, sweeping up with a fuller elbow in the forefoot, in short, follow the usual custom in cutters like Vanduara, and I am confident that Thistle's shortcoming in pointing could be totally effaced, in which case she may yet become the fastest thing of her length ever floated.

POPULAR ERRORS.

Naturally enough the casual observer seizes with great avidity upon the centerboard of Volunteer to explain all differences. It is so much simpler to tell centerboard and keel apart, than to weigh less easily perceived characteristics that the popular critic is just now enthusiastic in behalf of an attribute which has really no more to do with Volunteer's victory than the white paint on her sides.

All manner of prophesies are indulged in, and even our British cousins are depicted upon the verge of clutching eagerly at the board, while cutters are once again presumed to be effectually killed, buried and funeral services closed.

Unfortunately for such prophets, the cutter has been similarly slaughtered upon previous occasions, and all England was to do homage to the golden image, the centerboard sloop. But the grand sommersault backward has never progressed beyond the columns of uninformed public prints. Once upon a time, not many years ago, when the cutter and cutter principle were still in their swaddling clothes in America, danger lurked in the defeat of a big cutter challenging for the Cup. But the cause of cutters survived the critical era when Genesta sailed away empty-handed, and at once grew and flourished beyond expectations. The keel was dutifully killed again when the stately Galatea met with no better luck, and just now, with poor Thistle's defeat totally misinterpreted, there is a fresh installment of vigorous killing underway. It is destined to be as barren of consequences as the desperate assaults in the past. The cutter has been too well established in America by this time to need the coaching of an "organ" nor yet the "moral suasion" which would have followed the loss of the America Cup. Her prosperity is founded upon the solid rock of natural selection.

Practical yachtsmen, who follow the doings of a Clara or a Papoose as positive evidence, and the doings of an Anaconda or a Gracie in negative support, are not likely to lose their heads in premises which admit of such clear solution as the Thistle international matches.

There need be no fear of a step in retrogression. The truth, as set forth above, will prevail in the long run, and the assimilation of the sloop to the normal cutter will proceed without interruption.

A FORECAST.

The progressive development of the Burgess boats is exceedingly instructive, and points the road for the future. His boats have been successful exactly in the degree to which he departed from the sloop and edged over toward the cutter.

Puritan was the first step in this direction, and she vanquished the old order of sloops.

Mayflower followed with a further approach to the cutter in her greater draft, displacement and heavier keel. She in turn defeated Puritan.

Finally comes Volunteer, surpassing Mayflower in her cutter features, being another step nearer the regular cutter, and she out-tops all previous efforts.

No one understands better than Mr. Burgess that the possibilities of the "half-and-half" type have been exhausted in Volunteer, and that "out designing" will have to give place to "out-engineering." More ballast, lower ballast, deeper keel and more rig—the cutter in place of the sloop—such is the only tool by which the brave Volunteer's colors can be lowered. If not a cutter from abroad, then a cutter of home manufacture. It is only a question of time. Until she appears Volunteer is cock of the walk, unless Thistle falls into hands which will know how to get out of her what there really is in her.

C. P. Kunhardt.

ULIDIA AND FANITA.—The season will probably close with a race between these two boats, the one an extreme cutter and the other an old-time sloop. The course is from Sands Point through Long Island Sound, around Montauk Point and to a finish off Sandy Hook Lightship for a $500 cup. The start will be made tomorrow morning, and with equal weather the race should be a most important one, when the position of each boat as a representative of its type is considered, but such long races are nearly always marred by the chances of unequal weather or flukes, and the results over this course in the past have been of little value.

THE "LONDON TIMES" finds in Mr. C. P. Kunhardt's book "Small Yachts" a hint of the proportion yachting and yacht building have now attained in America. It says: "A glance at a work on American yachts and yachting, which has lately been published, will show what immense pains and skill the Americans devote to the art of building fast sailing vessels. The truth is that with them yacht racing is an even more serious and absorbing pursuit than it is with Englishmen, and when an American devotes himself to a task of practical skill he is apt to be hard to beat in it."

NORRISTOWN, Pa., Oct. 3.—Montgomery Sailing Club, 19th cruise. Course, Norristown to Indian Creek and return, distance 5 miles. Wind very light at start, increasing to a fresh N.W. breeze before the finish. The start was made at 9 A. M.

☞ **No Notice Taken of Anonymous Correspondents.**

H. J. G.—The robin season on Long Island will open Nov. 1.

Plover, Richmond, Ind.—The bird which you say was sent to us for identification has never come to hand.

W. H. D.—Will the automatic shrapnel shell scratch the barrels in its exit? All the testimonials published are foreign, and if it is in use in this country would like the experience of our own people. Ans. We should not think it would scratch the barrel. Perhaps some of our readers may give their experience with it.

F. B. C., Emerson, Mich.—Of two rifles using the same weights of powder and bullets, which will have the flattest trajectory and the greatest range, a .32cal. or .40cal., which will be the most accurate? Ans. Each caliber of rifle to secure the best work carries its own weight of bullet and proportionate amount of powder. The .40cal. in the above case, provided with additional powder, would have the flatter trajectory and greater velocity.

R. H., Denver, Colo.—1. Are any express bullets made for a .44cal. D. A. Smith & Wesson revolver. If not, where could I get a mould to cast them myself? 2. Have you heard anything more about the Lebel rifle which you wrote about lately? Ans. 1. Write to Ideal Manufacturing Co., New Haven, Conn. 2. No experiments with the arm have been made on this side and the results of the French tests are carefully guarded.

W. P., Newark, N. J.—At a target excursion A plants two shots in the bullseye, each 1in. from the exact center, his third shot is a clean miss. B gets his three shots all in the target, one 8in. and the others 9in. each from the exact center. The target is 20in. in diameter with a 4in. bullseye. A claims to have beaten B, claiming a count on his miss of the distance from center to edge of target—10in.—which, with his two bullseyes make a measurement of 12in., while B asserts that his three shots in the target are better, regardless of the measurement, than those made by A. Ans. Under Creedmoor rules B. wins.

New Publications.

"THE HIDDEN WAY ACROSS THE THRESHOLD," by J. C. Street, is the work of a modern transcendentalist, one of those books that the great majority of men in this busy material age would characterize as spiritualistic humbug and throw aside without reading. It is nevertheless a work which any thoughtful man may read with profit, for apart from its spiritualistic claims, it teaches the profoundest and simplest of all lessons for humanity, a lesson which like a bright silver vein has ramified through all the ages, teaching that man's redemption can only come through self renunciation, and the development of the Divine spark of love within him.

On the metaphysical side it agrees with Spinoza's teaching of an universal world spirit of which man and matter are but visible representations; but on the spiritualistic side the writer claims to teach the existence of a future state, not as a metaphysical speculation not of faith, but according to knowledge acquired by the exercise of spiritual senses, which he claims lie dormant in all men, and capable of being roused into activity.

It would be presumptuous in the inexperienced to deny the existence of spiritual senses, capable under culture and development of apprehending spiritual phenomena, but when we find the writer accepting the phenomena of spirit rapping and table turning as the work of a lower order of disembodied spirits, who avail themselves of material means for establishing communication with mediums, his claims are brought within the sphere of ordinary scientific criticism.

There is a chapter on mind cure which is professedly speculative, but this is a problem which, while it lies very close to "the threshold," is a legitimate and hopeful field of research for the material scientist.

For the rest the volume, which reaches to 586pp., abounds in extracts from the wisdom of Egyptians, Brahmins, Buddhists, Jews and early Christians, indicating that the belief in a Supreme Creative Spirit of light, of which the human soul is a ray, originated with the earliest Aryans, and has been preserved by every great section of the Aryan race. The writer claims that in all ages there have been spiritualistic mediums. It is not a book to interest the multitude; it will be found interesting and instructive to the man who desires to keep himself well informed as to the various phases and direction of current thought; and for the humantarian and reformer it teaches the great lesson that no reforms in social conditions can come from without, that they must proceed from within outwardly, and can have no other basis than the active sentiment of mutual good will. (Boston: Lee & Shepard).

AN AGED TRAVELER AND HIS DOG.—Yesterday afternoon the *Courant* had the honor and pleasure of a call from Capt. Robert W. Andrews, of South Carolina. Fido accompanied him. The Captain was ninety-seven years old on the Fourth of July, this year. Fido will be five years old on his next birthday. They walked up from South Carolina early in the season, and now they are walking back again, talking things comfortably, not hurrying themselves unduly, and seeing the sights as they go along. It is the Captain's seventh visit (on foot) to the North, and Fido's second. It is only justice to Fido to mention that he has also accompanied his master on a Southern pedestrian tour which took him as far as Texas, a long journey for a small dog. The Captain's host of friends in Connecticut will be glad to hear that he is looking well and feeling well—his eyes as bright, his cheeks as ruddy, his laugh as cheery as ever. He has enjoyed his summer North very much, he says. Besides seeing his son in Boston, he has taken a ramble through Vermont and New Hampshire, and has revisited the village up in Maine where he learned the shipwright's trade in 1817—before he went to sea a-sailoring and learned that trade. (Perhaps this is as good a place as any to say that the Captain is also a practical farmer and a horse doctor of 74 years' standing, with army experience as a veterinary surgeon under his good friend, Gen. Wade Hampton.) The mention of his five years before the mast reminded him of a story. When he got home from sea his own mother didn't know him, and liked his looks so little that she was unwilling to harbor him over night. As he was turning away she asked him where he lived when he was at home. "I was raised about heah," he meekly replied. At that his brother shouted, "It's Bob!" and the fatted calf was sacrificed in due form. Unless unexpectedly detained on the way, he and Fido will reach South Carolina about Nov. 1—perhaps sooner if he makes a contemplated purchase of a horse and buggy for the more convenient carrying of his books, etc. Once home, they will take a months or six weeks' rest, and then start on a walk across the continent to San Francisco. "I think now we shall come back around the Horn," said the Captain. Good luck go with them!—*Hartford Courant, Sept. 16.*

The Schultze Gun Powder Company, Limited,

32 GRESHAM STREET, LONDON, ENG.,

Have the pleasure to announce they have opened an agency for the sale of their well-known Smokeless Sporting Powder, the

IMPROVED

GRANULATED WATERPROOF

Schultze Gunpowder,

At VON LENGERKE & DETMOLD, No. 8 Murray Street, New York,

Where it may be obtained at WHOLESALE OR RETAIL. Price, $1.00 the canister, equal to 1 lb. Curtis's & Harvey No. 4 Black. Dealers' discount on application.

The Schultze Gunpowder has firmly established itself in England and on the European continent as excelling all rivals, giving GREATER PENETRATION, CLOSER PATTERN, LESS RECOIL, LESS SMOKE, LESS FOULING than any other powder. It has *no prejudicial effect upon the barrel*, and is *practically unaffected by damp*. Charge as compared with best black powder equal by measure or half by weight. **It is loaded with the utmost ease exactly as black powder.** It requires *no ramming* or pressure in loading. American cartridge manufacturers are now experimenting with a view to issue a primer of the same strength as the English primers to do away with any possible slow fire or the necessity for priming with a few grains of fine black powder.

As regards trap shooting performances, Schultze Gunpowder is the champion powder, having been used by the prize winners at all the principal meetings both in England and on the continent during the last eight years. During the late international week at Hurlingham and the London Gun Clubs, June 13-18, 1887, the gentlemen who used Schultze secured prizes amounting to £3,200, against £560 won by those using all other explosives combined. Numerous experiments carried out by the English Proof-House Guardians, and by the editor of the London *Field* and others have proved beyond question that Schultze Gunpowder, while being equal in propelling force to the best English black powders, gives less pressure on the barrel even when subjected to varying temperatures, and is therefore as safe to use as black powder.

SPORTSMAN'S OUTFIT

The Forest Waters the Farm;

OR,

The Value of Woodlands as Reservoirs.

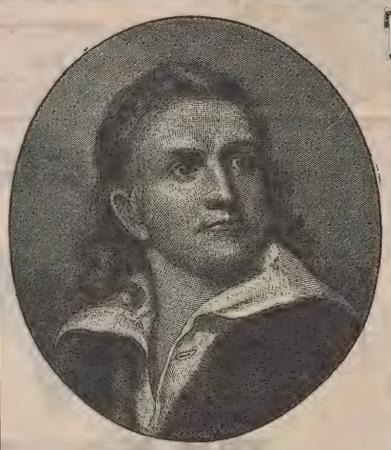
BEING THE LES ÉTUDES DE MAITRE PIERRE SUR L'AGRICULTURE ET LES FORETS.

PAR M. ANTONIN ROUSSET.

Translated by
REV. S. W. POWELL.

The introduction reviews the extraordinary movement of torrent taming in France, in preparing public sentiment for which the Studies of Master Peter played a noteworthy part. The book was written as a sort of science primer, setting forth the first principles of the relations existing between woodlands and agriculture. The principles and reasoning are not less applicable to the United States to-day than to France then.

Price in cloth, 75 cts.; paper, 50 cts.



FOREST AND STREAM PUBLISHING CO.

A NOTABLE ART ENTERPRISE!

The Sportsman's Reverie.

A SERIES OF PICTURES FOR SPORTSMEN.

READERS of the FOREST AND STREAM cannot fail to recollect Mr. Thomas F. Watson's poem entitled, "The Sportsman's Reverie," printed in this journal about two years ago. Later on a few stanzas were added to cover other scenes of typical American sport with the gun. The author depicted vividly the varied visions which come before the view of the veteran sportsman as he sits in easy chair before the fire. Of the author and his poem the *Detroit Free Press* said in an appreciative notice: "The author is evidently a man of the most acute sportsmanly enthusiasm, as well as of nice literary taste. His poem is built upon a very simple plan. Before a cheerful fire—like Ike Marvel's hero—sits a veteran of rod and gun; he grows half drowsy over pipe and fire and the poet has caught—with a nice and sensitive appreciation—the reminiscences of a hundred hunts which flit through his brain. One experience after another is described with graceful pen touches; the quail, the woodcock, the snipe, the deer, fall before the crack of the gun; a long day's sport—a glorious day such as no man ever compassed between sun and sun—is described, even the trout, from the clear rapid, paying tribute to the prowess of a dreamland sportsman, until at last, with the fall of the quiet night shadows, the sportsman draws his boat to the shore, his tired retriever crouches at his feet, and, with his ducks, the final trophies of his sport, at his side, he looks back over the darkening water; and then, once again at his fireside, the end of the vision comes naturally and gracefully."

And now these "word pictures" of the poet have been complemented with the actual canvas pictures of the painter. Artist-poet and poet-artist have united to give us the poem in a magnificent setting. Mr. Robert Hopkin, the celebrated artist of Detroit, has painted a series of twelve pictures, each telling in color what the poem tells in words. From these paintings have been made superb heliotype engravings, each having beneath it the particular verse of the poem illustrated. The series is remarkable for strict adherence to nature, fidelity in portraying action, and artistic merit.

THE TWELVE PICTURES:

No. 1 shows the hunter seated in an easy attitude in an arm chair, gazing reflectively into the fire on the hearth. Above the fireplace are the head and antlers of a deer. The sportsman's right arm is around the neck of his dog, which is resting on his haunches beside the chair. His left hand holds his pipe. The firelight flickers on the floor and around the legs of the chair.

No. 2 represents dawn breaking over a small lake. The night shades are fleeing. A mist is rising from the eastern end of the lake, of which trees fringe the edge. A plover is circling in the air, and in the foreground is a mallard lazily flying out over the glassy water.

No. 3 represents snipe shooting. In the foreground is the sportsman, his body twisted around to the left in the attitude of making a double on snipe. Standing beside him is the setter, waiting for the word to retrieve. To his right is the border of a wood, the branches bending to the strong wind. In the distance are the sails of craft on the lake.

No. 4—woodcock shooting—shows an opening in the copse around whose border a brook is winding. In the foreground, standing deep in the ferns and rank vegetation, is a setter on a point. Behind the dog is the sportsman in the attitude of shooting at a bird flying directly over him.

No. 5 shows a quail hunter in the foreground, walking along ready for the shot, which will follow the rise of the birds, on which the dog is drawing to a point. A haze is over all, and the sky is that of a day in Indian summer.

No. 6 depicts grouse or partridge shooting in the beech woods. The hunter is walking down a slope. The dog has come to a point ahead of him. The bird has flushed and the hunter is shown aiming. The pointer has stiffened into an attitude of strained attention, as he watches the bird fly away. The upper part of the sportsman's body is in the shadow, the lower part in the strong light of the sun rays.

No. 7 shows an angler reeling in a trout. A brook is tumbling down through the woods and over the rocks into the pool. The sky is cloudy and the sunlight is struggling through.

No. 8—deer shooting—is a forest scene. In the foreground a buck, just shot, is falling on the edge of a lake. Tearing down the slope behind him are two hounds. To the left, behind the roots of an upturned tree, are seen the head and shoulders of the hunter, whose rifle is still bearing on the deer.

No. 9 represents shooting over decoys. A gale is blowing and the water of the channel outside is lashed into whitecaps. In the bay the decoys are tossing in the chopping waves. In the foreground is a point of rushes, in which the skiff of the hunter is partially concealed. The flock of ducks, which has just swung in outside the decoys, is broken by the discharge of the first barrel. One section is wheeling out over the river. The other has broken off to the side and is wheeling out again to meet the first section. Some scattered birds are dashing above the head of the hunter, and he is twisted around in his skiff aiming at a bird flying above and behind him.

No. 10 shows flight duck shooting. The scene is a marsh, on whose broken surface the sun is setting behind the clouds. In the foreground, on a grassy point, are the hunter and his spaniel. The hunter is in a kneeling attitude and in the act of firing his first barrel. The spaniel is plunging into the water to retrieve the bird which has fallen to the first barrel. In the distance are flying ducks.

Nos. 11 and 12 represent the hunter retiring from the marsh and at home, and these two are among the strongest of the set.

The pictures are printed on the best 150lb. plate paper; size of paper 24×30in.; size of print 14½×17½in. The pictures have the tint and tint border, and the artist's remarque and signature, and form artist's proofs, an édition de luxe.

PRICE, $30 FOR THE SET; SINGLE PICTURES, $3.

A fine black and white Llewellyn setter, 15mos. old, sired by the field trial winner Gus Bondhu ex Model Druid; yard broken. Address, A. M. TUCKER, 85 Main street, Charlestown, Mass.

CLIFTON KENNEL.

The pointer kennel of America for field and bench stock, offer for sale pointers, thoroughly broken; pups by champion Graphic ex champion Clover, and some by Mainspring ex Lulu. Address with stamp CLIFTON KENNEL, 203 Summit avenue, Jersey City, N. J. sep15,tf

---

TWO CHOICE BRED LLEWELLIN SETTER dogs, 8 mos. old, will be sold at once at a low price. These dogs are perfect in every way, and combine the strains of some of the best known prize winners on the bench and in the field. For particulars and pedigree address

W. W. WILSON,

Shawsheen Kennels, Billerica, Mass.

DOGS FOR SALE.

Newfoundlands, St. Bernards, Mastiffs Setters, Pointers, Spaniels, Pugs, Yorkshire Skye, Scotch, Fox, Bull and Black and Tan Terriers, Blood, Beagle and Fox Hounds. Dogs and Pups at low prices.

E. MAUREE, 464 N. 9th, PHILAD'A., PA.

FOR SALE.—A NICE LOOKING, YOUNG and well broken pointer at a very low price. JOHN T. FRANCIS, Hartford, Conn. sep22,3t

---

Naso Blood.

Pointer puppies of this strain for sale, whelped July 25, 1887; $10 to $25. Address FLOYD VAIL, Box 3003, New York. sep29,tf

FOREST AND STREAM

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, OCTOBER 13, 1887.

VOL. XXIX.—No. 12. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications on the subject to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 80 cents per line. Special rates for three, six, and twelve months. Seven words to the line, twelve lines to one inch. Advertisements should be sent in by Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Reading notices $1.00 per line.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by express money-order, registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. For sale by Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Davies & Co., and Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

NOTES AND COMMENTS.

CARIBOU snaring is practiced on quite an extensive scale in the Jacques Cartier district of Quebec. Slipnooses are set in the trails through the thick windfalls. One trapper secured in this manner seventeen caribou last season, and there is reason to believe that many others were equally successful. The carcasses of caribou taken in this way are abandoned, only the hide being saved. The law forbids this; but the snaring is carried on in remote districts where detection is difficult. It is plain that Canada cannot afford to have her large game destroyed in such a wasteful way. In these days when hosts of sportsmen are more than ready to pay liberal sums to transportation companies, guides and others, in quest of large game, it is simply foolishness to sacrifice caribou for the paltry price of their hides.

The change in the weather is very welcome to the sportsman, not only on account of the greater comfort in the field, but also because it will bring the migratory birds from the north. The woodcock will undoubtedly move rapidly now, notwithstanding that, according to the theories of some of our oldest shooters, the moon is not right. The belief that the birds move when the moon is full is all well enough when the birds do move at such time; but their migration also depends upon weather conditions, and if these be unfavorable the wayward wanderers are wont to take their own time, regardless of lunar phases. Clear, frosty nights, although moonless, impel their southward flight.

Railroad and steamship companies interested in attracting tourists to Alaska have hit upon a variant of the sea serpent story. The numerous skeletons of extinct forms of animal life have given them a hint for the manufacture of a mammoth monster. The tale they tell, by reason of novelty, will be a more potent lure than the venerable serpent story. The Juneau correspondent of a San Francisco paper records the discovery of live mastadonic game in the wilds of the Stick Indian country. A native hunter followed the track, which was "larger around than a barrel," until he came in sight of a creature "larger than Post Trader Harper's store," with great shining yellow tusks and a mouth large enough to swallow a Stick Indian at a single gulp. If the public can swallow the story with equal facility, the lure will lead hosts of ambitious hunters to seek the mastadon preserves, and they will naturally fall back for supplies on the establishment of thrifty Post Trader Harper.

The Tombs police court officials were greatly interested last Saturday by the advent of Miles and Henry Conklin, two backwoodsmen from the hoop-pole district of Johnsontown, on the line of Rockland and Orange counties in this State. They were in charge of Game Protector Godwin, and had a basketful of snared grouse, which they had brought to town to deliver to a game commission house which makes a specialty of such merchandise. Miles and Henry were locked up, and Monday another Conklin, John, joined them, also conducted by Mr. Godwin, and bearing thirty snared birds. When they came up before the justices yesterday their quaint ways created much amusement for the Tombs people, and the justice was so touched by their wretchedness that he let each of them off with a fine of $10, and sent them back to their haunts in the woods.

These men blubbered and whined all the time they were in the Tombs, and abjectly begged to be sent home. The judges naturally took pity on them, but such sympathy was misplaced. The Conklins belong to the Rockland county gang of snarers whose illicit booty has been shipped to their accomplices in the commission business here year after year. Caught and brought to justice here in New York, they are humble enough, but at home in Rockland they show a very different bearing, threatening to shoot any sportsman who has the temerity to break up their snares. Not long ago they procured a coffin and left it on the front stoop of a house as a warning of death to the inmate for his part in destroying their lines of snares. Such members of society hardly deserve leniency when a game protector succeeds in nabbing them.

The recent experience of Mr. T. V. Woolrich, of Halifax, Nova Scotia, is of interest, because it shows how much a man who is lost in the woods can actually go through before he succumbs. Mr. Woolrich, who is sixty years old, started out the other day to explore a portion of the Mount Uniacke gold district, lost his way in the bush, and existed on water alone for eleven days. When found he could not articulate. He had succeeded in finding the track of the Windsor and Annapolis Railway, and there lay down. Attaching a piece of his shirt to the remains of an umbrella, he stuck it in sand as a signal of distress to attract a passing train. This was not noticed until a freight train rescued him after eleven days.

Were the ordinance which forbids the discharge of firearms within city limits disregarded one would not need to leave New York to look for game. Our occasional correspondent "Canonicus" tells us that last Friday, Oct. 7, while in company with a surveying party on the Van Courtland estate in the upper part of the city, he flushed five heavy, strong-winged woodcock. There is more wild life in New York city than careless observers might suspect. A case in point came under our own notice the other day, on the banks of the Harlem River, near High Bridge, where we had an opportunity to study some interesting peculiarities of serpent locomotion.

Striped bass appear to be returning to their old haunts in this vicinity. The beneficial results of restricting net fishing have been demonstrated at Shark River Inlet, New Jersey, as noted by a correspondent, and Mr. F. O. DeLuze reports fine bass fishing at Whitestone, Long Island.

The English pheasants put out in the Tuxedo Park preserves in Rockland county, New York, have spread over the country for ten miles around. There is no law on them now, but one should be supplied, setting apart a proper season for their protection. If only given a chance they will furnish permanent sport.

The FOREST AND STREAM Decoration Day Trophy prizes have been awarded as follows: The trophy is retained by us to be offered again. The Knoxville and Delhi clubs having tied for it, and the Knoxville club being prevented from shooting off the tie, the value of the trophy was divided between the two clubs, by the agreement of both, $65 going to the Delhi Club and $35 to the Knoxville club. The Fountain (of Norwalk, Conn.), Baltimore, Parkersburg and Wichita clubs divided first money prize; the Solomon City, Kalamazoo and White City clubs divided second; and the Wingohocking and Smith & Wesson clubs third.

The entries for the Eastern Field Trials to be held at High Point, North Carolina, next month, are more in number than have been made for any trials yet held in this country. There are nine in the champion stakes, fifty-two in the all-aged setter stakes, and twenty-eight in the pointer stakes. The dogs are of good quality, many of them have been run at former trials. The large entry indicates that the trial will be an unusually interesting event. The only thing to be feared is that it may be so large as to be unwieldy and prolonged, particularly if the weather be unfavorable as last year.

Last winter the Legislature of New York appropriated a sum of money to build a fishway in the dam across the Hudson river at Troy. We cannot learn that any steps have been taken to begin this work, and the appropriation will not be available a year from now. The bill was passed by hard work on the part of those anglers who are interested in having the salmon and other fish pass the dam and it is now necessary to stir up those State authorities who have the authority to do the work. It is evident that some one needs to be reminded that it is time to begin work.

The Michigan change of woodcock season appears to have been a wise one. Formerly it had been the custom to shoot the birds in July. By a new law this was prohibited in the past summer, and the result was a good supply of game in September, when the season opened. This has been the experience elsewhere when summer woodcock have had a chance. The game sought in the later months is strong of wing, plump, and well worth while bringing to bag; not at all like the half-fledged young and ill-conditioned old birds of July and August.

A new street, which will cut through Trinity Cemetery, will necessitate the removal of the remains of Audubon the naturalist. The street will be named Audubon avenue. It is proposed by the Academy of Science to erect at the head of the avenue a monument in memory of the great ornithologist.

Dr. Henry G. Piffard has invented a method of taking an instantaneous photograph at night by the flash of powdered magnesium sprinkled on gun cotton. When the invention is fully perfected it will be practicable by one pull of the trigger to photograph a coon at night and bag it too.

The Connecticut woodchuck supply holds out well. One Bristol farmer has a score of thirty-seven "varmints" trapped this season; and another Bristol man counts twenty-eight notches on his barn door, each notch tallying a woodchuck to the good.

Mr. Henry Folsom, head of the firm of H. & D. Folsom, gun dealers of this city, died last Monday, at the age of fifty-eight. Mr. Folsom was widely known to users of firearms, and was highly respected by his associates in the trade.

Cape May has had a mass meeting to take action on the menhaden fishing, which is claimed to be destructive of food fish. A committee was appointed to wait upon the President and ask him to refer to the subject in his next message.

The Esoc Quet hunting party have returned and report a successful campaign. An account of the excursion, written by one of the party, will be given in our next issue.

OCTOBER.

DOWN from the north they are marching,
The scouts of the Winter King;
Where bright spring flowers were blooming,
Withered and dead leaves they fling.

Their bivouac fires they've kindled,
Sumacs and maples aglow;
Oaks on the hillside are waving
Signals to birches below.

O'er field and meadow are drifting
The smoke and dust of the fray;
In woodlands dead leaves are falling,
This Indian Summer day.

SPICEWOOD.

A BIRD HUNT IN WESTERN KENTUCKY.

I.

LITTLE attention is paid to protecting either game or fish in Kentucky. While there are laws on the statute book providing penalties for hunting game out of season, and for taking fish by net, seine or trap, they are as obsolete as the slave provisions in the State constitution. There are no wardens, no special instrumentalities for enforcing the statute, and any one giving information of infractions of the game laws is looked upon with disfavor. It is, in fact, a disreputable business to "tell on the poor fellows," and public sympathy usually aligns itself on the side of the offender. As a natural consequence, game and fish are scarce and rapidly disappearing. But few deer, turkeys or bears linger in the State, and the only sport left to kindle the blood and occupy the leisure hours of the ardent hunter is to search out the few spots where Bob White whistles his companions to the evening roost after feasting on the fat things of earth.

In search of just such a place the writer, with a companion thoroughly congenial and every inch a sportsman, left Frankfort one afternoon last December on the westbound train. Our destination was Wingo station, in western Kentucky, where report said partridges were plentiful. There were a couple of inches of snow on the ground the day we got off, and a bitter cold wind coming from the direction of Omaha. Yet we had made up our minds to go, and it would have taken something more serious to have broken our resolution.

Besides, we had been laying store by this trip for several months, and to have shown the white feather at the last moment would have cost us a deal of disappointment, besides losing our only chance for a year.

In our hunting box were stored about 700 shells; and our four dogs—Kate, Dyke, Whit and Set—were safely ensconced in the baggage car. Kate is growing in years, but her earnest glance of rare intelligence does not belie the keen scent, the patient industry and the unerring steadiness she possesses still as relics of past greatness. Dyke is younger, but restless, nervous and of dauntless endurance. Whit has the sad notoriety of being bobtailed—the fruit of a luckless fall of 20ft. from a second story. He seemed to recognize by his shy, sheepish glance, the oft-repeated joke that his tail had been driven up in his spine, leaving only the small bit exposed. Set was a long, slender, short-haired white pointer, whose special dread was briers. This quartette of hunters had seen service on many a fruitful field, but of late their education had been sadly neglected and their habits spoiled by sundry chases after "cottontails," under the seductive encouragement of the small boys at home. However, they seemed instinctively to "catch on" to the idea that sport was ahead, and their restless movements gave the baggagemaster no end of concern.

Less than three hours landed us in Louisville, and alighting on its hard frozen streets, with a bitter wind coming across the Ohio River and the mercury dropping toward zero, we felt the prospect of a pleasurable hunt grow dimmer each hour. Passing up Third street, the occupant of a doorway, who had sheltered himself from the wind, laconically ejaculated, as he noticed our dogs —"Been?" Our response, given with chattering teeth, was equally graphic—"No! going." No doubt he felt we were not "going" the right road to Anchorage Asylum.

Finding a hotel, at last, we entered and stumped the clerk at the desk by registering for self and dogs. "Can put you away, but don't know about the dogs," said he, in a puzzled sort of way.

"No dogs, no us!" we replied with emphasis.

Just at this juncture the night porter, with an eye doubtless to business, came up and guaranteed to provide the dogs with comfortable quarters, as he "knew of a good place." With a caution born of experience we went along to see that his guarantee was worth something. The hunter who fails to give a personal supervision over the security and comfort of his dogs will often find that promises are faithless and proper feeding left for "some other time." The quarters were good and warm, but reached only after threading the dark and devious byways, corridors and underground passages of a city hotel.

Next day we again entered the cars and hurried further westward. The snow had increased in depth, and after an all-day journey, as we landed at Wingo, a full 3in. lay on the ground. It was 9 o'clock as we halted at the station, and everywhere and over everything stretched the cold, silent mantle of white. The air was raw and keen, though the stars looked down from a clear sky.

Our advent at Wingo was quite a surprise to the inhabitants of that quiet town. It was a no less cause of disturbance to the genial landlord of the only hostelry as he surveyed our troup of dogs. While we were warming at the big fire in the office, and the dogs were making their presence pointedly noticeable by sundry scratches at the door and speedy intrusions whenever it was opened, Landlord Tartt was in a brown study over the "dog" question. When, at last, after much cogitation, he announced his purpose to turn his own horse from his comfortable stable quarters into the open lot and install the dogs in his place, we had no further doubt that we had struck the right man and the right place for hospitable entertainment. Whether the horse appreciated the exchange is doubtful.

Despite the cold, the usual crowd of villagers had gathered to see the train come and go. Our presence gave them new ground for speculation, and when my companion, whom I shall call M., frankly announced we had come 300 miles to shoot partridges, and proposed to spend a week at the business, a stare of incredulity resulted. There must be some mystery about these fellows, was the popular surmise. Hence, in the next day or two, we were beautifully clothed with suspicion as a couple of "detectives," nosing on the track of some undefined and mysterous criminal. What there was in our composition, or bearing, or the cut of our left eye, to lead a sober citizen to believe we might be two of Pinkerton's men "piping a mystery," or seeking to catch some safe-blower "dead to rights," was never settled between M. and myself. I loaded the blame on M., and he tossed it back to me.

However, by preserving strictly our sportsman pretentions, by the zeal with which we pursued Bob White over hill and valley, and by the soundness of sleep that followed each day's hard tramp, we got the better of Wingo's suspicious citizens, and established ourselves as genuine Nimrods, although a little "off" in the upper story. That 300-mile journey to shoot partridges was too big a cherry to swallow at one bite and taste good.

One incident we cannot forego. We trust our generous landlord will forgive the recital. Just before getting off the train a drummer interviewed us. Finding our destination, he cheered us by announcing Wingo as his own stopping place. We nailed him for information. Dwelling on the features of the place, said he, "You'll find plenty to eat and a good place to sleep. Nice clever people and sociable. Do you love pie? Yes? Well, you'll get plenty of pie—pie for breakfast, pie for dinner, and pie for supper." Modestly we denied the pie possibility. The drummer was obstinate. We ventured a trivial bet that there would be no pie for breakfast next morning. The drummer closed on the wager as a dog would snap a doughnut.

Next morning, as we sat down to a smoking hot breakfast, we had forgotten the wager, when happening to cast our eye down the line of dishes, there sat, in all its sweetness, the inevitable pie. At the same moment, we caught the eye of the drummer across the table. He remarked, with a quiet smile, "I win." I nodded. Conscience, however, compels the confession that while the pie was frequent, it was good. Born with a sweet tooth, we sampled it often, in common with the other good things that bountifully supplied host Tartt's table.

The first day of our hunt opened with forbidding prospects. Three or four inches of snow covered the earth, dazzling the eyes and making travel difficult. The country was new to us. Nobody, "except Captain George," hunted birds at Wingo; and, unfortunately, we had failed to make Captain George's acquaintance. Little definite information could be gained as to the locality where birds were plenty. Those of whom we made inquiry seemed obliging and desirous of extending all possible knowledge, but not being hunters, their information was largely incidental and inferential. Generally, we were told that for years birds had been abundant, but the deep show of the previous winter had starved and frozen them out.

M.—ever ready for the fray—was eager to be off. So, investing in a pair of light rubber overshoes to insulate my feet from the melting snow, we donned our hunting suits, filled our belts and pockets with shells, whistled Dyke and Set over the fence, having tied up Kate and Whit for future use as a reserve, and ploughed through the snow to the eastward of the town. We had levied on the little son of our host as guide.

Several hundred yards travel brought us to the frozen bed of a long gully, beset with bushes and briers. It afforded good cover against wind and cold, and as the dogs rapidly coursed its path and hiding places, we confidently watched for signs of a covey. We were disappointed, for not a track was visible, nor did the dogs betray evidence that they caught a scent lingering on the frosty air.

In a little grove of locusts, off to the right, our guide detected the ears of a "cottontail" peeping above the snow. Getting into position where he could see the body of bunny, he shied, one after another, the apples he had in his pocket for lunch, at the little animal without hitting it or frightening it from its bed. Breaking off the branch of a tree, we handed it to him, and taking better aim, he hurled it with such force as almost to bury the rabbit in the shower of snow. The latter, feeling it was time to say good-bye, went off down the hill at ninety miles an hour.

Crossing a rail fence and getting into a tangle of long grass, briers and weeds, we found the first evidences of Bob White's habitat. A covey had been running through the snow, feeding on the seeds of the rag weed, and their tracks led up the dry run. The scent was cold, however, and the dogs shifted about uneasily. Keeping them well in hand we followed the tracks, momentarily expecting a point or a break away. Our spirits experienced a sudden check as we found in the snow the broad foot-prints of a rabbit hunter, and at the same moment noticed the brush of wings on the white surface, showing only too plainly that our feathered friends had taken flight at his intrusion.

M. now veered to the left, and I hunted a long thicket of briers and bushes ahead, without success. Turning into an old field, I was just climbing a ridge when I caught sight of a covey taking flight out of a swale of matted grass. Going fifty yards, they dropped down again in a copse of green bush. M. had not seen them, although Dyke, working eagerly to his right in the thicket, had flushed them without dropping to point. Hurrying up, I called M., and we moved carefully to where the birds had gone down. The dogs went in ahead. The birds were wild, and one went up before we got near. I let drive, making a snap shot, and he forgot to stop.

Another broke cover just in front and came straight at me, passing to the rear. I wheeled and fired, and he—didn't stop. This was bad. M. was under the brow of the hill, and didn't get a chance. The balance of the covey got up some distance ahead, and went across a field toward a piece of woods. As they disappeared we heard a couple of shots, and clearing the thicket, we found three rabbit hunters, one of whom had killed two of the partridges at one shot as they flew by. Of this performance he seemed exultingly proud. Had he killed his mother-in-law by accident, he could not have shown profounder emotions of pleasure. While we were talking to our new friends, the dogs were nosing around in some light sedge grass. They had not yet found reason to halt, when M.'s quick eye detected a covey in the snow. They had not left their night roost. Here was a good chance for a pot-hunter. Foregoing the opportunity, the birds were flushed, and three quick shots dropped two, and I got another with the second barrel as they crossed an adjacent fence.

Leaving the rabbit hunters we followed the birds into the woods. They were much scattered and most of them we failed to find. M. sighted one that was winging its rapid flight through the trees, and dropped it at full 60 yards. It was a quick shot and well done. Climbing a second fence we bagged a right and left, and missed one that we watched till it again came down in a fallen treetop. Going up together we prepared to close its career. M. took one side of the tree and I the other, and giving the limbs a shake as we went by, we had almost met again when quick as a flash the bird went up behind us, and putting a tree to his rear with quick instinct of escape, he scudded away as two loads of shot rattled harmlessly among the twigs. Returning to the first woods, I was kicking a pile of brush when another rose and was climbing for the sky through the treetops when he was called back at the report of the gun.

It was a long tramp before we found more birds. The snow made it tiresome walking and the air was raw. Several seemingly good places were hunted through without result. Threading a small patch of stubble at the end of which was a thicket, I caught glimpse of a covey running on the ground. They had seen the dogs, which were lower down the hill, and were hastening away.

Calling to M., I moved carefully forward, but before the dogs got in range they went off into a piece of woods. I was fortunate to get two at one shot, while M., who had not yet come up, shortly afterward bagged another, at which I had made a clean miss. When we again got the birds up in the woods they were well scattered and the shooting hard, but in a half hour's work we had dropped seven or eight birds, only a single one getting away. About half the covey we never found after the first rise.

We were now tired and hungry, and, crossing one more field, located ourselves on the sunny side of a rail fence and industriously began the demolition of the lunch our kind landlady had provided. It aided materially in warming up the inner man. When we had finished the dissection down to the bones the lunch was washed down with a draught of cold water, obtained by breaking the ice of an adjacent pond.

The afternoon was almost barren of result. M. took a random shot at a stray bird that rose from a thicket some distance off, but it saved both body and feathers. Later on several more partridges were added to the bag from the first covey we found in the morning, and M. closed the day's sport by showing how long and how far a man can fall when he trusts to appearances in crossing a gully with snow. Taking the full measure, we should judge M. to be about 22ft. high, as that length of snow was torn up, mashed down and displaced from where his feet entered a muskrat hole to where his hands left their imprint.

Seventeen birds were the outcome of the day's sport, a result not bristling with encouragement for five days yet to come.

THE ARMADILLOES.

BY R. W. SHUFELDT, M.D., C.M.Z.S., U. S. ARMY.

Corresponding Member of the Linnæan Society of New York City, etc., etc.

IN my last contribution to FOREST AND STREAM, having reference to my series of "Sketches of our United States Mammals," I had something to say about the Opossums, and the Provisional List of Mammals of the U. S. National Museum was carried through the Anteaters in that paper. To continue that List in the order in which it was published, we find the following to be the continuation of it, viz.:

SUBORDER LORICATA.

Family DASYPODIDÆ. *The Armadilloes.*

Tatusia novem-cinctus (Linné), Alston. Armadillo. Texas to Paraguay.

So then, to proceed with the plan as set forth in the Opossum paper, we will in the present connection turn our attention to the Texan Armadillo, and what we know of its life-history, while in our next contribution the Order SIRENA will be dealt with, and this contains no less interesting an animal than the Manatee of Florida.

When a zoölogist, in these days, directs his mind toward the study of any particular animal, or group of animals, one of the first questions he asks himself is, What has been the history of this creature during the past ages of the world; and, during that universal, for all-time development of animate forms, what have been the lines of ascent along which it has come to bring it to its present appearance, and structural state? Now in the case of our reptile-looking Armadilloes there is much, very much, to be discovered and correctly interpreted yet before any such question can be answered. The present richest center in its variety of living species of Armadilloes is the general central region of South America; and it is here, too, that Professor Lund and others have found, more particularly in the bone-caves of Brazil, the skeletal remains of not only existing types of Armadilloes but of those forms which connect the existing ones with armadilline animals of the most recent geological periods. But as I say there is an enormous field yet to be worked up here, which is brim-full of interest and importance. Paleontologists of the future will surely undertake all this and the day will come when men will probably know, through the remains of extinct forms brought to light, the very path along which Armadilloes have ascended from their ancestors of low reptilian stock. Those who have been in the main hall of the old Smithsonian Building, may remember the great cast of a queer, turtle-looking animal, that used to stand by the door that led down to the west basement below, it was the plaster-of-Paris model of a Glyptodon (*G. clavipes*), and the Glyptodons were gigantic ancestors of the Armadilloes

of rhinocerine proportions. They flourished in old tertiary times in that region near where the city of Buenos Ayres now stands; and they were characterized by having a solid armor-like covering for their upper parts (carapace), and a bony dermal plate for the belly (plastron). They rank among the most remarkable of the extinct forms that have thus far been brought to light.

But let us return to our own existing species of Armadillo, which is sometimes met with in the lower parts of Texas, the variety generally known as the Nine-banded Armadillo (*Tatusia novem-cinctus*).

The animals of this group get their name through the Spaniards from a word which means "clad in armor," while the common Brazilian name for them is "Tatou," our animal being known as the Tatou-peba. If I remember rightly the technical term for them is derived from a Greek word meaning "hairy-foot," and, as unsuitable as it is, *Dasypus* is still retained for one of the generic groups.

on each side to the elbows. It is composed of small pieces adhering to one another, and disposed in numerous parallel concentric rings, having the concavity toward the front, the first ring embracing the neck of the animal. The buckler of the croup extends from the back to the origin of the tail, and descends on each side to the knees. It is composed, as in the former case, of small pieces arranged in a great number of parallel concentric rings, passing transversely over the hips, but having their concavity turned in the opposite direction from that of the rings on the shoulder, or in such a manner that the last embraces the root of the tail. When viewed externally, the little pieces composing these bucklers have the appearance of irregular tubercles, but when examined on the under side of the buckler they are found to be hexagons almost as regular as those of the cells of bees, and fitted as precisely to one another. Between the bucklers of the shoulders and the croup are interposed a variable number of transverse movable bands, marked with zigzag lines

to feed upon some worms or roots, for all such things pertain to its natural diet. If you can manage to follow the animal unobserved, it may still pursue its foraging until perchance it may come across some ant-hill or other, whereupon it immediately proceeds to open up the nest with its fore-paws and devour the alarmed insects as they swarm out of their abode. As it feasts upon these it is heard, ever and anon, to give utterance to a faint squeak of satisfaction, a habit to which it is also prone while engaged in digging its burrow or feeding upon carrion, another thing of which an Armadillo is very fond. It has been said also that these animals have been known to burrow into human graves for the purpose of gratifying their appetite in this last-named and more depraved direction. Notwithstanding this fact those people who live in the countries where Armadilloes are found, are very fond of the animal roasted whole in its shell, esteeming the dish a great delicacy.

Let us now suppose that you have alarmed the animal

A PAIR OF TEXAN ARMADILLOES (*Tatusia novem-cinctus*).—From a Drawing by the Author.

To the unthinking, the first sight of one of these animals would convey the idea to the mind that it was a sort of mammalian tortoise, so puzzling is its external structure and appearance. Aside from certain strictly anatomical points, Professor Flower has characterized the present genus as having a narrow head, "with a long, narrow, subcylindrical, obliquely-truncated snout. Ears rather large, ovate, and erect, placed close together on the occiput. Carapace with seven to nine distinct movable bands. Body generally elongated and narrow. Tail moderate or long, gradually tapering; its dermal plates forming very distinct rings for the greater part of its length. Forefeet with four visible toes, and a concealed clawless rudiment of the fifth. Claws all long, slightly curved, and very slender, the third and fourth subequal and alike, the first and fourth much shorter. Hindfeet with five toes, all armed with strong, slightly-curved, conical, obtusely-pointed nails. The third longest, then the second and fourth; the first and fifth much shorter than the others. This genus differs from all the other Armadilloes in having a pair of inguinal mammæ, in addition to the usual pectoral pair."

To this description I would add that the animal has small, weak eyes, although the organs of hearing and smell are both highly developed. Further, the legs are short, and the general form squat and broad. The several parts of the armor are spoken of as "bucklers," and in no existing species are these extended under the belly.

Another authority, speaking of our species, says: "The buckler of the shoulders extends in front over the whole neck, and toward the rear as far as the back, descending forming very acute angles, and in some degree gliding over one another according to the different motions of the animal. It is observed that the full-grown specimens always have the greatest number of bands, which renders it extremely probable that new bands are detached from the bucklers as they are required by the increasing growth of the animal. The buckler on the head descends from the ears to the muzzle, and covers each cheek as far down as the orbits; and there are small detached scales interspersed in various situations over the throat, the under jaw, the legs, and feet, and even on the outer side of the ears."

In most specimens the skin has a leathery appearance, and is but sparsely covered over with hair; we note, too, that when the head of the animal is held in certain positions, the bucklers of the head and body are much more nearly approximated than shown in the figure, and the former being short, additional protection is afforded to these parts. Our Armadillo has simple teeth of a subcylindrical form, and peculiar in standing apart from one another along on the jaw, very much as we see them in some reptiles, and in dolphins. An adult specimen of the Texan Armadillo has a total length of about thirty inches, the body and head alone measuring sixteen, and the tail having a circumference of about six inches at its base. The animal is a great burrower, and being nocturnal by habit spends most of its time by day in its burrow.

Should any of us meet an Armadillo in its native haunts, it would probably be seen to be walking leisurely along, stopping every once and awhile to devour some fruit or other which has fallen to the ground, or perhaps

you have been watching; it immediately pricks up its ears, for its hearing is very good and its eyesight very poor, and most often relying upon the former while it mistrusts the latter, it commences a rapid retreat in the direction of its burrow. The fact flashing upon your mind that this is one of its means of defense, you put after it with your best speed, and you soon discover that an Armadillo as a racer is an eminent success, but being well in the lead of you, and the ground being to its advantage with its home-base still in the dim distance, the brute with marvellous rapidity commences to burrow on the spot, and before you are half aware of it he has put himself fairly under ground. At this stage of the proceedings you arrive at the scene of its newly-made retreat, and are made aware from the squeaking that is going on, and the way the dirt is coming out, that your game will soon be in the regions below.

Off comes your coat, and rolling up your sleeve you reach down the hole after him, and soon have his armor-clad tail in the grasp of your good right hand; but, lo! what is this extraordinary change that has taken place, for either the fellow has thrown all of its spare anchors overboard, or else it has suddenly been transformed into some creature as big as an ox, that is if you may judge from the resistance it offers to being pulled out. Extraordinary stories are told of how Armadilloes can resist almost any force exerted to haul them out of such a hole, and one "traveler" goes so far as to say that he actually had the tail of the animal come off in his hand, the "case-hardened wretch" parting with the appendage rather than give up to his efforts to extract him.

This species is very abundant in southern Mexico, and especially in Nicaragua, where I am told that the people hunt it at night with dogs, much as we do our Opossums in the Southern States. The Mexicans often keep a tame one about the house, it making not a disagreeable pet, and having the additional advantage of keeping the premises free from ants.

Normally, the general coloration of an Armadillo is a reddish-brown, but it usually appears much darker from the fact that, owing to its habits, a good deal of dirt adheres to its armor and hide. Its cleaned shell, too, by no means makes an unsightly ornament when hung up in one's study, as it is not an uncommon thing to see in houses in those countries where the animal abounds.

The "Tatou-peba" rarely has over three or four young at a birth, and very curious-appearing little fellows they are, if we may judge from the admirable figures of them in Professor W. K. Parker's well-known work upon the "Structure and Development of the Skull in the Mammalia."

In various parts of South America, our Armadillo has some very interesting, not to say rare, relatives; there is the little-known Pichiciago, only five inches in length, with its silky white hair, and its shell of a pinkish tint; there is the six-banded Armadillo, which can roll itself up in a ball, and tumble down among the rocks, as an additional means of defense; there is the giant of them all, the Great Armadillo (*P. gigas*), of northern Brazil and the forests of Surinam; and, finally, there are the three-banded Armadilloes, of which the Matico is a prominent example (*T. conurus*).

The Bibliography of the Order EDENTATA, to which our subject belongs, is not, as yet, very extensive, and a great deal still remains to be learned and written about them. Those who may chance to be on our southern Texan border, can render valuable and lasting aid to science by making accurate record of observations upon these animals, and duly publishing the same; noting their exact geographical range, their more peculiar habits; their period of gestation and reproduction; and, finally, their uses to man. Such persons as are engaged in the study of the structure of the animals which are known to inhabit our country, will be very glad to get spirit specimens of Armadilloes, more especially the fœtal young.

CAPTIVE GROUSE AND OSPREY.—Elmira, N. Y., Oct. 6.—Last week a very fine specimen of the ruffed grouse flew into a house near the State reformatory, near this city, and was captured without harm. I have him now in a coop made especially for him, and he eats and drinks and seems to get along fine'y. He is a fine male bird and full feathered. I have had another fine bird presented to me. It is a fine young male American osprey (*P. haliaëtus carolinensis*). He was picked up last night in the heart of the city by a gentleman and handed to me for identication. It seems that while flying over the city he struck a telegraph or telephone wire and was stunned for a moment and fell to the pavement; while fluttering he attracted the attention of his captor and was immediately picked up. Both of my birds are in fine condition, and I expect to find out a few interesting facts concerning their nature and habits.—EDWARD SWIFT.

RECENT ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDEN.—Received by purchase—Five rhesus macaques (*Macacus erythræus*), three green monkeys (*Cercopithecus callitrichus*), two common macaques (*Macacus cynomolgus*), one sooty mangabey (*Cercocebus fuliginosus*), one weeper capucin (*Cebus capucinus*), two prong-horned antelope, male and female (*Anticopra americana*), twenty-seven prairie dogs (*Cynomes ludovicianus*), one male zebra (*Equus burchelli*), one Cayenne rail (*Aramides cayennensis*) and one banded rattlesnake (*Crotalus horridus*). Received by presentation—One flying squirrel (*Pteromys volucella*), one woodchuck (*Arctomys monax*), two reed birds (*Dolichonyx oryzivorus*), one blackbird (*Turdus merula*), one American robin (*Turdus migratorius*), one mockingbird (*Turdus polyglottus*), two alligators (*Alligator mississippiensis*) and two box tortoises (*Cistude clausa*).

Game Bag and Gun.

RAIL AT WILMINGTON.

IT is useless to attempt to find marsh hens or clapper rail unless the tides are high enough to cover nearly all the grass in the salt marshes. The idea prevails that this favorable condition is more likely to exist at the autumnal equinox, or at the full moon in September. Being so advised, and tired of the long close season, my friends Teceel and Mud—the man who did not swap his premier Scott for a cheap gun—and I, went to Wilmington on the 27th of the last month, with an abundant supply of shells. The Rev. Mr. B., of Wadesboro, preceded us by a day. After reaching the sound we were assured by the weatherwise that good tides would greet us. We tried it for three days, but the water did not rise high enough, and the birds which we sought were invisible. If we had gone a week earlier we should have found all the sport which the marsh hens afford, and could easily have had fifty or sixty shots on a tide. But the trouble is that, living in the interior, we never know when the tide will be high, and in consequence nearly always miss the favorable time. I took 180 shells, and brought back 179, getting one shot and one bird. Our clerical friend killed six, Teceel six, two yellow legs, and several willets, while Mud got three marsh hens and five willets. The preacher killed a few squirrels besides.

Our host furnished us with a Flobert rifle, with which we amused ourselves shooting at a target. All of us beat Mud.

We have planned a duck hunt on Topsail Sound, about the first of December. Crickett will be with us, but Mud will not be. We hope to get mallards, teal and black-ducks; and possibly a goose and a deer. Oysters will come in also. WELLS.

A YOUTHFUL MOOSE SLAYER.—George Sutherland is a lad of fifteen years, and lives with his parents on the road leading from Ashland, Me., to Fort Kent, a few miles from the former place or village. As he was returning homeward from the village at about 9 o'clock P. M. Oct. 4, he was confronted at about two miles out by a large bull moose. The ugly brute's charge was met by a shot from the lad's pocket revolver, which felled him with a hit square in the pate. While lying stunned he received six more shots from the tiny gun which laid him out. The meat dressed out over 500lbs.—WARFIELD.

OCTOBER FIFTEENTH.

THE mild October has begun
(The Fall, in other words),
And soon each man will grab his gun
And go to hunting birds.

The bright-skied "fifth" is here to-day,
The "opening day" is near,
For when ten days have passed away
The fifteenth will be here.

Each morning now the hunters rise
To see if it is fair;
They eager scan the morning skies,
And sniff the morning air.

Oh glorious, glorious, *glorious* Fall!
Take Winter, Summer, Spring—
And you can knock the spots off all
For shooting on the wing.

Some men there are who cannot know
The joy that fills our souls
To see our pointers bounding go
O'er meadows, dales and knolls.

Our pity falls like gentle dew
Upon the poor, poor wretch,
Who never yelled "I knocked down two,
Here Bang, good boy, go *fetch*."

We've had our share of earthly sweets,
We're getting old and gray,
But Heaven's the only thing that beats
The Fifteenth—Opening day.

OCT. 5. F. M. GILBERT.

IN THE SAWTOOTH RANGE.—III.

NEXT morning the sun rose bright and clear; and we spent a most delightful day in fishing. We had the good luck to chance upon an old boat, or rather scow, in which we navigated over this beautiful lake.

Friday morning Charles and I rode over to the town of Sawtooth for flour and other needed supplies, and to make inquiries about our further route. Returning early in the afternoon with the supplies and desired information, the rest of the day we spent with the redfish. Early on Saturday we left those remarkable lakes for the Sawtooth Valley, having been informed that as soon as the trail leaves the woods we would notice a new white house down the valley; and taking this as our guide mark, we made a bee line for it. In Mr. White, the owner and occupant, who keeps a hay ranche here in the valley, we found a very pleasant gentleman, who, after hearing what we were after, advised us to go to the head of Fourth of July Creek, about eight miles, where we would find deer and possibly sheep. A Norwegian who was at White's and prospected at the creek, went along with us, but it was dark before we reached his cabin. Pitching camp across the creek, where we found better pasture for our horses, we soon busied ourselves with our own supper, after which we paid a visit to our neighbor. Here we found three nationalities, an American, a negro and our Norwegian friend, whose cabin was not finished, so he chummed in with Mr. Blackman, the colored gentleman, and whose name deserved to be Whiteman, as he was clever and intelligent, as well as kind and obliging.

Blackman showed us in the morning the lay of the country, and also where we would most likely find sheep. We hunted through a steeply encircled basin of most fantastic shape, Blackman and Bill going around the lower oblong basin, while Charles and I hunted through the upper half until we would meet; so that whoever started any game would drive them to the other party. We came together without seeing anything, but Blackman and Billy saw a small band of bighorns, which were disturbed by a bear. Blackman had shot at the bear, but missed him on account of the brush behind which he was sulking. They had also seen a second bear, but he was at a safe distance and soon out of sight. Hunting homeward for deer, as our camp was without meat, we killed two good-sized fawns, also several blue grouse.

It is remarkable how sudden the temperature will change in these high altitudes. The wind blowing southeast, jumped at once to the northwest, the sky showing the threatening look of a storm, beginning with a slushy hail, which the cold wind soon turned into beautiful snow. Reaching camp at last, we found things in a decidedly uncomfortable condition, for, not expecting such an early snowstorm, we had left everything lying loose around camp; but a blazing camp-fire and a fine venison supper quickly elevated our sunken spirits. We slept not any too warm that night, the mercury falling to 20 above zero; but in the morning the sun rose warm and bright, and soon all signs of the snow had vanished. Our colored friend assured us that a snowstorm up here (the altitude being at least 10,000ft.) was nothing uncommon in any month of the year: last Fourth of July they had celebrated the day in one which lasted all day.

The next forenoon we hung around camp, drying and cleaning our wet garments and rifles; in the afternoon we inspected the boys' mining claims, principally of silver, some of galena containing silver in rich quantities. Tuesday we made a more extensive tour after bighorn, but though we ran on a small band, they heard or scented us. We fired a volley at long range after them, but with no more damaging results than wounding one, but which escaped with the rest, over the almost perpendicular and impassable rocks. That night we decided to pull up the next morning, and go down to the river, following the valley. I felt rather disappointed, as I wanted a nice pair of bighorns to perfect my selection of antlers. Our Yankee friend who came to see us, drew a rough map of our trail, which we were to follow to Stanley Basin, known as a fine game country. Wednesday we bade farewell to our friends and the mountains. Reaching the valley, we followed the Salmon River until we came to some hot springs, our day's camp. Our next day's camp was to be Stanley Lake, fifteen miles further on our improvised map. Traveling pretty fast that day, finding good roads, we soon came to a creek where some prospectors were taking their midday lunch; they told us that we had passed Stanley Lake five miles back. This news was not very pleasant, as our ride was through a mountainous prairie, through which a fire had raged shortly before and was still burning in places. The main fire had crossed the river, and was carrying everything before it; the long stretching line of flame, fanned by the wind, leaping sometimes 20 or 30ft. into the air, was a terrible fear-stirring sight, the black voluminous smoke almost darkening the sun by its density. Returning about five miles we found our lake hidden in the dense forest.

Scouting around the lake in the morning we found nothing but a few deer and some old bear signs. The next day we hunted and searched through the neighboring cañons and gulches, but with no better results. We found another lake a few miles above our camp containing redfish. I also shot on this lake a bird which was a rare specimen and a curiosity. Finding a roughly made boat left by some hunter and trapper, we paddled around after some ducks, which were feeding in an upper cove of the lake, when I noticed a flock of birds swimming, and looking to me more like snipe than ducks. Discharging one barrel of my Parker, I succeeded in killing three out of the flock. They are of a delicate light gray or dove color, except the tips of wings black, and neck and breast pure white, resembling a large yellowleg snipe, only three times as large in body, twice as long legs, which were half webbed, also the bill as long as a woodcock's, but more slender, their meat dark and rich and of delicious flavor. Finding not much game around these lakes we moved further down and camped on Valley Creek.

Examining our supplies we found we were running short on flour and several other important articles, and concluded to go to Bonanza, the nearest mining town, to replenish. So Sunday early, with one pack horse in tow we started. Meeting an old pioneer and rancher, Mr. Challis (the founder of the town of that name), who was looking for some lost horses, we were informed about our route; we were to follow the river five miles until coming to a large creek (Yankee Fork), and following the trail on this creek would bring us to town. Parting from him we kept riding until coming to a large bridged-over creek. Thinking we had come five miles, we thought this Yankee Fork and took the trail alongside, but we were wrong, as it proved later, to our sorrow; we were on Basin Creek; and our Yankee Fork was the next creek.

Owing to this mistake we kept on traveling until dark, hoping to strike some town or mining camp, but had to camp at last. Our situation was not a cheerful one. We did not know where we were; besides we were very hungry, as all we had eaten being a light lunch, for we had expected to make Bonanza before evening. The night was cold, and our saddle blankets were the only covering to keep us warm. We were glad enough when morning came; and we determined to push ahead on the trail which must lead to some destination. It was about noon when at last, from a clear and elevated bluff, we noticed a cabin in the valley below us, and emerging entirely out of the woods, we soon saw the long looked-for town lying before us.

We pushed down the hills in great hurry by the loudly clamoring inner man; we tied up in front of the little hotel, and were soon punishing a nicely prepared breakfast, after which we went to Pfeiffer's supply store, where we replenished our exhausted provisions. Mr. Aleck Pfeiffer, owner of the handsome store, also part owner of the principal mine here (Custer) and the great bear hunter, gave us good advice and accurate directions for our home trail. By our own mistake, we had traveled about thirteen miles out of our way.

Well supplied with provision, and encouraging hopes, we left Bonanza in the afternoon, camping that night under more comfortable conditions. In the morning we set out, taking a short cut across the mountains. Leading our horses, and tacking down a dangerous steep bluff, I noticed a black bear, jogging lazily along the opposite ridge. Calling Charles's attention quietly, we tied our horses. We had to make quite a detour to get the wind and above Mr. Bruin, and Charles saw him lay under a black pine whose lowest branches were spread on the ground, making for him a soft and comfortable bed. Charles, who gave him the first salute, shot him through the ear. He jumped on his feet surprised, and shaking his head, when I put a bullet through his shoulder. He fell, but roused himself to get away, when another ball out of Charles's Marlin doubled him up, and he went rolling down the hill until a fallen tree stopped him. While watching him tumbling down, Charles cried, "Hurry, Frank, there goes another one!" Both of us ran around the hiding point and saw about 150yds. below us another bear, making time for the safe underbrush. Being behind Charles, and somewhat out of wind, I waited for his shot. The first shot made the bear yell, but the second one stopped him never to rise again. They were both large yearling cubs, very fat and with beautiful fur, and we were soon busy with their hides, keeping an open eye for any sudden surprise from their ancestors. This unexpected encounter delayed us somewhat, and it was dark when we got back to our old camp on Valley Creek. Billy was waiting with a fine venison supper; he had killed a fat doe, and also shot at a large brown bear, wounding it badly, but getting away from him.

The next few days we hunted faithfully through all the surrounding cañons and gulches, and had moved our camp nearer the lake, seeing a great many signs around the shore, some of them evidently of game of immense size, but we could not see any "bar." We could have killed plenty of deer, but Billy had brought one hind-quarter of the large doe; besides our larder was well supplied with birds. The foolhens were very plentiful, but we would never waste any powder or shot on these well-named birds. They would hardly fly out of our way, but sat stupidly looking at us, and we pegged at them with stones, aiming for their heads, and in this perhaps not sportmanlike, but quite exciting manner, secured all we wanted.

Friday, all of us hunted at the upper end of the lake, through a wild desolate cañon, and being near where Billy had hung up his doe, we intended taking some of the venison into camp. But coming to the spot we found old Eph had preceded us; and not satisfied with the entrails, he had torn down the deer and covered it up with dirt, leaves and brush for another visit. We held a council of war on the spot and decided to "lay for" the thief. Billy and Charley were to go to camp and bring out a few blankets, some grub and a few large beaver traps, which we intended to plant under and around the tree, on which we hung the half-eaten carcass; and then, lying in ambush, we hoped to give him a warm reception. I was to remain and watch for "his nibs," should he contemplate an early visit.

It was 3 o'clock in the afternoon when the boys left me. I established my lookout on a large isolated boulder

from which I could see all around and not 75yds. from the bait. Having fallen into a half doze on my observatory I felt a cold chill run over me when I heard some cracking of brush restore me to my full senses. At first I thought the boys were coming back, but I knew they would come from the opposite direction; and then I saw the cause of the disturbance as an immense cinnamon bear emerged from the thicket and stopped and scented the air suspiciously. The wind was in my favor and I did not move a muscle. Satisfying himself that all was serene he cautiously moved toward his feast. Carefully reaching for the rifle I held it in ready position; and thanks to the ivory Lyman front sight I could just see the dirty brown monster looking my direction. Steadying my nerves I pulled the trigger, and the express ball, driven by 120grs. of powder, crashed into his skull. Uttering almost a human cry of pain and despair he rose on his hindfeet and fell down like a log. Quickly inserting another cartridge in my "Old Reliable" I made doubly sure; but it was not necessary; the first bullet had done its deadly work. It is simply wonderful what a hole the express or hollow bullet will make.

I waited fully ten minutes before I inspected my victim. He was indeed a monster; and sitting down on his huge body, I was the proudest mortal of all humanity. Lighting my pipe, laying my trusty rifle across my knee, in this position I waited for the boys, and it was dark when at last I heard Bill's well-known signal hoot. He was alone, as Charles had remained in camp, thinking it useless to watch for a bear or try to trap him in a beaver trap. Billy was loaded down with blankets, traps and cold grub. He had left his horse at the foot of the mountain. Asking me if I had seen or heard anything, I replied, trying to speak carelessly, "I got him." "Got what?" "Our venison thief." We made a blazing fire, which showed the ugly fellow in still larger proportions. While Billy examined the monster I enjoyed my cold supper which he had brought from camp. Taking a nightcap and lighting the last pipe, we were soon rolled up in our blankets, and I slept as only a happy hunter can sleep. At daylight we skinned the bear, and took only the pelt, as as we had all we could pack, until coming down where Bill had left his horse. We got into camp in a few hours. Charles had gone out, but Billy and I quickly had some venison on the fire, the coffee boiling, and, finding some beans which Charles had cooked, we sat down to a fine breakfast. I had had nothing warm for twenty-four hours. Charles came in by noon, looking surprised and well pleased with my success. The afternoon we spent in stretching the hide on a frame made out of four large poles and cleaning rifles and shot-un, while Bill went to look after some traps he had set for beaver and foxes.

The next morning, Sunday, we decided to move camp fifteen miles further down the valley, near Cape Horn cabin. Here the valley opened to a considerable extent, and Mr. Pfeifer, of Bonanza, had recommended it a favorite resort for bears. Around the springs and boggy flats abundant camas root was growing, a great attraction to them. Monday, before day, Charles and I were on hand, carefully scouting along the meadow valley, but came upon no sign. After the sun was high we left this and went into the opposite mountains. Coming out from a rough cañon upon an open clearing I noticed two deer picking the tender shoots near a little spring, at least 200yds. away. Aiming a little high at the shoulder of the nearest, I fired. At the report of the rifle both stood looking paralyzed, when one, without stirring, fell in his tracks. His companion gave two or three jumps, stopping and looking for his mate, and only ran off when I showed myself. Charles, who heard my shot, came up and we went to the deer. It was a sleek two-year-old doe. We dressed and hung her up. On our way home we met Bill, who had set a number of traps in the Salmon for beaver, and some for foxes and land fur along the trail.

In the morning we took a stroll down the valley to Cape Horn cabin, the tumbled-down ruins of a former cabin, which a daring speculative fellow had erected during the Wood River boom. He was killed by the Bannock Indians, when they took the warpath in 1878. Returning to camp by noon, after lunch we saddled two horses, took grub and blankets, and went back the trail to some flats, where we had seen fresh signs on our way down. Reconnoitering until too dark to see, we turned in, hoping for better luck in the morning. Substituting an old tomato can for a coffee pot, we had an early breakfast and were again on the look out. But no sign of bruin rewarded us. The bears did not come down to the flats. Either the ground was too hard and dry, or they preferred the plentiful berries nearer their mountain home.

Saddling our ponies, we rode across the valley, to bring in the doe I had killed. Taking the horses as near as possible, to the gulch, we cut her in half, bringing down only the hind quarters. In the morning Billy took up his traps, bringing in three beavers and two foxes, one handsome crossfox got away, pulling out the stake; it must have been a beauty, to judge from the long silken fur we found, but in spite of all searching he could not be found. We left the Cape Horn country, and camped several miles below the cabin. Friday we had a steep climb, and went down to Bear Valley, where, at the upper end, we established camp. It is a beautiful valley, very wide, and about 15 miles long, cut in two by a fork of the Salmon River, and inclosed by sloping mountains.

Saturday we started on our tour of exploration, Billy to examine the rivers and creeks for fur-bearing animals, while Charles and myself were in search of large game. We followed the fresh tracks of a band of seven elk. Coming to the south branch of the river, where they had crossed, we had to construct a bridge by throwing trees and logs across, when it began to hail, and a heavy storm was approaching. We thought it wise not to follow the elk, but to get back to camp, as our tent was not set and our things were lying around loose. We returned and had our tent up, and had just finished a windbreak, when the storm came upon us. The next morning the air was pure and fresh, and we all started for a roundabout trip. Billy helped us to construct a bridge across the river, he remaining on the camp side to look after his traps; while after balancing ourselves across the slippery logs, we separated, Charles taking a high ridge, and I keeping lower down the sidehill. Coming above a small grove of quaking asps, I noticed fresh deer signs, and the next minute a noble buck jumped up and put off down the hill. He stopped within easy rifle range, looking back at me. Forgetting all my good resolutions of respecting the Sabbath, and being out of meat and out of lard, I put my rifle up in an instant. Remembering the express bullet, I sighted at his neck, which was partly bent back. The ball struck his shoulder, and glancing along, cut a deep furrow; but the scattering pieces, which will always break from a hollow bullet, cut a fearful hole, acting like dynamite. He made two or three frantic leaps, when he collapsed, painting everything crimson with his life blood. It was a very large and fat animal, with magnificent antlers. I dressed and hung it partly on a tree. Going to a creek to wash the blood off my hands, I saw another one standing not 50yds. away. I drew a fine bead between his eyes, but did not shoot; and he suddenly scampered off into the brush, not knowing what a close escape he had for his life. I sat down to eat my lunch and wait for Charles to come; but being on the other side, he had not heard my shot. He felt sorry when he came in camp, as he also had killed a very large buck.

F. B.

MAINE DEER HUNTERS HUNTED.

THE deer doggers are occasionally brought to justice, but it has to be done in Maine, and somehow it takes the energy of Commissioner Stilwell to put the thing through. Three men, termed Boston sportsmen, though there is at present no evidence that they belong in Boston, have lately come to grief for the illegal hunting of deer in Maine, both in close time and with dogs—they have come to grief in a way that they will not like to repeat. The thing happened in the vicinity of the famous Nicatouse Lake, about the only section of that State where the dogging of deer is rather aided and abetted by the inhabitants. The newspaper accounts are very glowing concerning the affair; one paper claiming that the game laws have given the State more trouble than all the rest of her statute book, but never once remarking that the simple way for the poacher is to let the deer alone in close time, and in the open season not to hunt them with dogs.

In a true statement of the case it appears that Commissioner Stilwell became convinced the last week of the close time that parties were killing deer, and with dogs, in the near vicinity of Nicatouse Lake, and accordingly he dispatched wardens French, of Calais, and Pond, of Princeton, to look up the matter. The wardens adopted the Indian plan of camping on the track of the sportsmen. They followed a party of three, with their guide, into the woods, and they reached the hunting grounds at about the same time, though the sportsmen had not the slightest idea that they were being watched. On Wednesday morning, on the borders of Cassabeus Pond, the wardens first discovered their men. They came up within 200ft. of their camp and hiding in the woods, they heard the conversation of the hunters. They were preparing for the hunt. They had with them two valuable dogs. They were heard to remark that there was no danger from wardens, and said that they would carry out the following week three deer each. They started out early and the wardens followed them all day, covering themselves by the trees and bushes. The dogs got on the track of several deer, but lost them in the water, and the men shot none. They returned to camp, followed by the wardens. The latter slept with no covering but boughs, only a mile from the men they were watching. The next morning at daylight they again made their way to the sportsmen's camp and repeated the programme of the previous day, but the Boston gentlemen were more fortunate. About noon one of their dogs got on a deer scent and soon ran him down. French and Pond were in at the death, but were unseen. One of the sportsmen dispatched the animal by a fine shot, amid great excitement.

That night the wardens camped again only a short distance from their men. The night was intensely cold, but wardens Pond and French are not men to flinch when there are deer doggers to be caught. They had no blankets, but there was promise of more sport the next day, and that kept them warm. In the afternoon the hunters got on the trail of more deer. A noble buck, scared by dogs, turned and came back in the direction of the wardens. The latter, standing on the bank of a small stream, heard him coming, and dropped into the bushes to let him with his pursuers pass, but the deer was brought to bay in the stream and the sportsmen came up at once. Warden Pond found himself in direct range, and scrambled for a pile of fallen logs. Then came a regular shower of bullets, and the two volleys fired by the men went plump into the logs in front of the warden's body.

In this place of ambush the wardens soon saw another deer killed, but the bullets came altogether too near for comfort. They now had two cases of deer dogging and killing in close time, and they thought best to communicate with the commissioners. They started on foot fourteen miles, and by canoe twelve miles to the town of Weymouth. Here they stopped for food, being nearly starved. But that night they again started on foot for Winn, twenty-three miles away, and reached there at 4 o'clock in the morning, tired and footsore. They then went to Bangor by rail, but as the offense had been committed in Hancock county, they had to go to Bucksport for warrants. These they obtained, and started back for Cassabeus Pond to find their men.

The wardens again came upon them early Tuesday morning, just as they were breaking camp. They arrested them, after some fussing and fuming by the hunters, but by the time they reached Bucksport, where they were taken for trial, they had concluded to surrender. On the way the wardens had also drawn into the service Warden McLane of Mattawamkeag, so that there were three rather formidable men against the Boston sportsmen, should they offer any resistance. At Bucksport they were arraigned before Trial Justice Ames. There were penalties recoverable upon all the charges for which the offending parties were liable, to the amount of $1,600, but as they made no defense, they were only mulcted upon two charges each, in the sum of $200, making the entire penalties and costs up to $900. Hon. T. W. Vose appeared for the State. Under the new law, evolved from the intelligence (?) of the last Maine Legislature, the penalties now all go to the county where the offense is committed, and hence the worthy wardens in this case do not get half, as formerly. The wardens have the credit of a masterly piece of detective work, done in the woods and under extreme difficulties. The sportsmen did not know of their presence till they were arrested. Neither did Jack Darling, the famous Nicatouse landlord, know that the wardens were in the woods. It is a facetious remark of one well posted, that if all the cussedness going on in Hancock county—breaches of the game laws in particular—"could be cashed in the form of penalties, the County Treasurer at Ellsworth would have about money enough to pay the national debt." The names of the offenders above mentioned have not been given to the public; they called themselves Richard Roe, John Doe and Mr. Poe.

SPECIAL.

SHOOTING NOTES.

SOME six years ago a great spring tide rolled in upon the marshes in the eastern Virginia broadwater, and strange to say destroyed hundreds of clapper rail, (mud hens). These were washed from the great Matulican marsh, and were found dead along the mainland shores of Accomac and North Hampton counties. A similar tide visited the coast of Georgia on Sunday, Sept. 18. It was caused by a terrific northeaster. Fourteen miles south of Savannah the marshlands were inundated and on it hundreds of rail were shot. The birds were pushed for and some of the gunners boated as high as seventy rail.

Prairie chickens are very scarce this season in southern Kansas. I have a friend who resides near Osage Mission, who writes me that there is not one bird there to where there were one hundred three years ago. This diminution was caused by the great snows and severe cold of the winter of 1884–5, which compelled the birds to migrate to the Indian Territory and Texas. The same winter destroyed the quail in Kansas, Missouri, Iowa, Illinois and Indiana. It will take many successive mild winters to restock these sections. In northern Indiana the quail are very scarce. The shooters there, however, enjoyed wonderfully fine snipe shooting there last spring, and the birds have just returned to the same ground to give the sportsmen their second innings.

About this time of year the boundary line between New York and New Jersey becomes obliterated in the minds of many New Jersey shooters. For this reason hundreds of ruffed grouse (partridges) are illegally shot in New Jersey. The season for these birds does not open in New Jersey until Nov. 1, while in New York they can be killed on Sept. 1. Thus a mere unmarked boundary line divides the season by two whole months.

I have just come from northern New Jersey and found the swamp lands in good order for woodcock and some few birds scattered over the best ground. This especially applies to the bog meadow lands in the mountains of Sussex county. On Greenwood Lake there are a few wild ducks, each of which has been shot at over fifty times. A few teal are knocking about Newark Bay and the Elizabethtown meadows.

On Saturday, the duck shooting begins on Barnegat Bay; at least I am told so by a Point Pleasant bayman. The rail shooting on the Raritan and Hackensack proved a fizzle. Bay shooting, however, on the snipe marshes of the first named river has been as good as the average. Already three have been made "cripples" this month. The last case was on Monday, when Peter Jones, of Newark, had part of his thigh removed by a New Brunswick friend named George Nolan.

From Connecticut I hear very discouraging accounts of the quail crop. Even those who preserve lands are complaining. This will make the sportsmen fall back on the partridge (ruffed grouse) and woodcock. A friend of mine has just been telling me something about the new Marlborough Gun Club, whose object is the leasing of lands and waters for shooting, fishing and hunting purposes; also the restocking of the same. It has secured 5,700 acres of land in the southeastern corner of Hartford county, adjoining Middlesex and Tolland counties, Connecticut. The land is leased direct from the farmers. The tract is in Marlborough township, which is about ten miles square, with only an inhabitance of 500. The character of the county is rough and hilly, with some farming land devoted to the raising of grain and buckwheat. The members stop with a farmer by the name of Samuel J. Coleman, who looks after their interests. The officers of the club just elected are: President, Wilson De Peyster; vice-president, James M. Bloomfield; treasurer, Gustave Walters: secretary, ———; trustees, officers *ex-officio:* W. B. Putney, B. B. Hopkins and Edgar De Peyster. Among the members are: John D. Cheever, A. W. Belding, M. M. Belding, Edgarton Bynner, J. G. Dettmer, Wm. G. De Witt; Dr. Z. T. Emery, Jas. W. Fellows, E. M. Le Moyne, J. C. Monroe, Duncan K. Major, Wm. B. McKean, Jas. R. Michael, Dr. Henry G. Piffard, Wm. J. Swan, R. S. Sinclair, John B. Wallace and J. P. Walters. There are plenty of partridges on the tract, some woodcock and a few quail. The club ordered several hundred birds in the winter for re-stocking purposes but the shipment failed to reach the club as promised last spring. The club is not an expensive one to belong to.

An easterly wind brings news from what is going on at Shinnecock Bay, Long Island. The warm weather of the latter part of last week checked the flight of fowl. But later on there should be plenty after every rough storm, as there is an abundance of feed in the bay. This is in deep water. A succession of high tides and the closing up of the inlet are much against shooting, however. Windy weather will drive the birds on the flats and make some shooting, but the water on the shoals will be too deep for the batteries. The best place in the bay to go will be William A. Lane's. Mr. Lane is well posted and the men from his house get the best of what is going on. The snipe shooting on his island has been the best this season in ten years. There are birds to come yet, but the water is getting too high to do much with them.

THE WISE ACRE.

NEW YORK, Oct. 11.

ADIRONDACK DEER.—Number Four, N. Y., Oct. 6.—*Editor Forest and Stream:* The open season for hounding deer, which closed yesterday, has not been a very successful one, not many deer having been killed in this section. The Beaver River Club, who are bitterly opposed to hounding deer, have by their influence and example nearly abolished that cruel and destructive mode of hunting throughout the entire Beaver River country, and the good results are apparent. Deer were never known to be so plentiful as now. If there is any one who does not believe that a strict non-hounding law is the best measure for the protection of deer, let him visit the Beaver River country this fall and he will go back a wiser and better man.—MUSSET.

MISSISSIPPI QUAIL.

ABERDEEN, Miss., Oct. 3.—The open season for quail in this county began on the first day of this month. The weather was very warm and dry, but notwithstanding the writer, with a friend who has not missed shooting on the first day of the season for many years, was out for an hour or two on the afternoon of the first. We were by no means successful; the dogs could not hunt, the thickets were in full leaf, the birds exceedingly wild, and some of the bevies found were too small to shoot; however, we managed to bag sixteen birds and each had a toothsome dish for Sunday morning's breakfast.

Quail are reported as unusually abundant, and most assuredly the past spring and summer have been more favorable for nesting and rearing the young than for many seasons past. Our season opens at least a month too early, and should not begin before Nov. 1. On returning from a visit to my place in the prairies a week or two ago I received additional proof of the fact that quail sometimes rear two broods in one season, as I saw a covey composed of birds fully grown and others which could scarcely fly, there being but one pair of old birds with them.

We have had some fine sport shooting doves in the wheat stubbles during the past summer. The best shooting was had on the first day of the season, when a party of twelve made an average of thirty-two each. Dove shooting is to me the most difficult I have ever tried; and, if a man can kill one-half of his shots, taking every reasonable chance, he is above the average. WILL.

SNARES VS. DOGS.

SYRACUSE, N. Y., Oct. 7.—*Editor Forest and Stream:* Being a lover of dog and gun, and a hater of snares and all illegal devices for taking game, I feel like raising my voice against farmers who snare partridges (ruffed grouse) for money. In the town of West Monroe, Oswego county, northside of Oneida Lake, live men having a few acres of ground too poor to raise white beans. By the first of September they have built miles of brush fences with a slip-noose set every few feet in the fence, for the purpose of snaring partridges.

To insure utter immunity from sportsmen, the supervisors and other influential men of the town of West Monroe have recently passed a law prohibiting all hunting with dogs for birds or rabbits. They know by experience that every sportsman who comes into the town with a bird dog will take considerable pains to destroy all the snares they may find. It certainly appears as if they meant to guard against it. I saw thirty-seven snared partridges brought to Syracuse and offered for sale. Mr. J. H. Mann refused to buy them; and later in the season, being offered so many snared birds as to disgust him, he gave up buying them entirely. Would there were more like him in Syracuse.

It is impossible for me to find words to express the condemnation I feel. I would like to hear from others on this subject. G. ALBERT KNAPP.

GAME REPORTS.

EAST SAGINAW, Mich., Oct. 3.—Woodcock shooting has been fairly good this fall. The great opposition heretofore existing to making the close season extend until September and do away with summer shooting, using as an argument that birds would leave here, and there would be no woodcock shooting at all if it was put off so late, has been largely done away with, as birds seem to have been as plentiful in September as they formerly have been in July. Very little ruffed grouse shooting has yet been done on account of the leaves not being off from the trees, but birds are reported plentiful. Several good bags of jack-snipe have been reported. They are evidently home birds, as the northern flight has not yet begun. Duck shooting is "no good"; so many railroads and sawmills along the Saginaw River have about driven out these birds, and do what they can toward protection, the shooting never will be as good as it used to be. Next Monday night a party consisting of E. N. Briggs, Ferd. A. Ashley, Geo. Moores, Jack Morley and myself leave for the Indian Territory, and will be present at the annual round up at the Saginaw Cattle Co.'s ranch. We shall take our dogs and guns along as quail are reported to be there in abundance. Jack M. also has heard that "Section 37" is to be found somewhere in the Territory.—W. B. MERSHON.

WILLIAMSPORT, Pa., Oct. 3.—Our county papers publish that the deer season will open Oct. 1; are they right? A party of our best citizens have started deer hunting with dogs. This is a common practice in Lycoming county, and unless stopped will result ill. We have enough true sportsmen in our county to crush the practice out of existence. All that is lacking is a "starter." A few words in your valuable columns may be all that is required. Squirrels are very scarce this fall, but pheasants are unusually plentiful. A fair day's sport can be had with the game of our county.—FAIR PLAY [The deer season for Pennsylvania opened Oct. 1. Hunting with dogs is forbidden. "Fair Play's" duty is to make complaint to proper officials.]

PORTLAND, Ind., Oct. 5.—The quail shooting opens here on the 15th inst., and the prospects for bagging the toothsome Bob White have not been as favorable in many years. The long dry summer has been very propitious to the young birds. The early or first broods are full grown and the second brood will be nearly so when the season comes in. A serious obstacle to the sportsman's pleasure is a determination on the part of a great many farmers to protect the birds, and the ominous sign "No hunting or shooting allowed on these premises," confronts the hunter at almost every turn.—D. S. W.

MAPPSBURG STATION, Va., Oct. 10.—As anticipated in a prevous article, I find the crop of quail to be quite abundant. I came across a bevy to-day near the house. Rabbits (hares), squirrels and foxes were never more plenty. My friend F. S. Smith has just completed a beautiful light-draft yacht, and is anticipating knocking brant and black duck right and left this autumn and winter.—T. E.

A HINT TO THE LONG ISLAND PROTECTOR.—*Editor Forest and Stream:* I wish to call attention to the manner in which the game laws have been violated for years here in the vicinity of Flatbush with no apparent attempt to prosecute the infringers or to enforce the law. What little game there is is hunted the year round, and on Sundays there is one incessant booming of guns right within hearing of the village church bells. It does not require a ten minutes' walk from the heart of the village any Sunday afternoon to find some city murderers crawling and sneaking along the edges of groves with heavy muskets or shotguns, looking for song birds sitting on the trees, to blow them to pieces. Outside of the song birds there is or would be sufficient game to warrant protection, and an enforcement of the game laws. There are a few woodcock and rabbits, but they get shot off early in the summer. Some of the Flatbush sportsmen planted a number of quail the past winter but they were shot off by outsiders in the spring and early summer. The game laws are enforced, or at least, more or less so, in the thinly settled parts of the country. Surely, where so openly and barefacedly violated for years in the very hearing of the metropolis of the country, the law should be enforced to a certain extent at least. The principle is just the same as though the case referred to a North Woods deer or a Maine moose.—PIOUS H.

A NEW HAMPSHIRE RESORT.—Haverhill, Mass., Oct. 3.—Sportsmen in the vicinity of Boston who have only a day or two to spare can find good fishing and shooting at Gumwood Lake, situated at Kingston Plains, N. H. Information can be had by writing to the proprietor of the Kingston House, Kingston Plains, N. H.—CLINGSTONE.

NORTH CAROLINA GAME LAW.

ROCKINGHAM, N. C., Oct. 4.—Below I give you the substance of the game laws of this State. They are not applicable to the counties of Johnston, Tyrrell, Dare, Onslow, Carteret, Jones, Columbus, Clay, Graham, Jackson, Swain, Macon and Transylvania. The law relating to deer does not embrace the counties lying on and east of the Wilmington and Weldon Railroad. No deer can be killed in parts of Burke, McDowell and Mitchell before Jan. 1, 1891.

The open season for birds is from Oct. 15 to April 1.

For deer begins Aug. 15 and ends Feb. 15.

No Bob White can be exported from the State. It is unlawful to destroy their nests. No ducks, geese, brant, etc., can be killed or sent off from Currituck county between March 10 and Nov. 10.

The bird law includes robins, larks, doves and ruffed grouse. The predatory birds, such as hawks, eagles, crows and owls, can be killed at any time.

The law protecting marsh hens, or clapper rail, applies only to the county of New Hanover, and is open from Sept. 1 to April 1. WELLS.

Sea and River Fishing.

A STORY OF HORNED POUTS.—II.

YES, I did promise to give you an account of that supper, and I do not believe in flinching, but I tell you, you ought to have been there to get anything like a true picture of it. This supper was at Uncle Bill's own house. His wife was sent out of the kitchen, and his "gals," as he called them, four buxom lassies, were also given to understand that they were no part of this occasion, it being for the boys only. We soon had full control of that old-fashioned Connecticut kitchen, with its big fireplace, smooth oaken floor, and a family table capable of seating ten or twelve. One end of this table was at all times reserved for Uncle Bill, and I might add, it was seldom spread except to its fullest extent, for his own family numbered an even dozen. We all turned to and helped to clean the pouts, aided by Uncle Bill's six boys, ranging from five to twenty years. By the time the fire was well going, Uncle Bill was in front of it with a griddle, full of pouts spattering and spitting away in a manner appetizing to us boys, who had been kept away from the pantry all day. At length the order came "all take seats," which was obeyed on the double quick. Uncle Bill played the double part of cook and waiter, waddling back and forth on about 2-minute trips from stove to table, and expressing much anxiety as to our appetites. Our plates were soon filled, and sooner emptied, and refilled and re-emptied of as crisp a lot of pouts as ever tempted any living man. The roaring laughter of Uncle Bill spiced the occasion, as he halted over his beaten track and pointed with pride to another full griddle of pouts. Being a hungry crowd, it made it quite lively for Uncle Bill to keep our wants supplied, but at length not even his urgent invitation could encourage us to eat more, and then he himself sat down.

"That old squire," he said, "knew full well he had no case; he knew my arrest would not hold me, so he says, 'Bill T., you can go, and I will see to it that you don't go far;' and at it he went to make out a warrant. Well, it makes me laugh. At the rate he wrote I calculated I had time to cross the State line into good old Connecticut. I plead my own case, and the squire let me go; and some of those same men who carried away pouts enough for half a dozen meals were there making a formal complaint, and when the squire said, 'You can go,' I said to myself, 'Now, legs, do your duty,' and I made lively time to the wagon and got under way at once and headed for old Connecticut. We drove fast, and when we were near the line that officer was in sight and gaining on us lively by running his horse. The calculation was a 'leetle' close for comfort, but we got there, and I had the pleasure of telling that fellow that I would settle with him for trying to steal me; and, boys, we will do him yet; what say you?" It was agreed "to do him."

Then, turning from the table, Uncle Bill invited his recruits to the open air of the yard, where the plan was perfected for the capture of the officer in case he visited the State. And this was the plan: We were each to act as a special detective, and if either of us set eyes on him we were to report to Uncle Bill, who was to have a warrant out for his arrest and manage the rest of the case.

For weeks we kept on the lookout for that officer; and the weeks lengthened into months, until one day some of our party saw the individual at the depot with his team shipping grain. This was duly reported to Uncle Bill, without the loss of a moment's time, followed up and the warrant made out and placed in the hands of an officer; with instructions "to levy on the individual and team upon his return, at sight." The following day, upon his return, the service was made, and the enemy was brought to bay. Then he sought the aid of friends and was busy nearly all the afternoon, skipping about for somebody to receipt for his team and become responsible for his appearance before the judge on the day agreed upon to answer to charges set forth in the voluminous legal document "in the name of the people for imprisoning one Bill T., a citizen of Connecticut." (And I supposed we were the people, at least our interest in the case led us to believe we were an important factor among them.)

The day arrived for trial, and all hands were there early, Uncle Bill with his counsel—the Hon. ex-Gov. Cleveland and Squire Graves—whom he had secured to look after his interests, all were promptly on hand at court when the defendant with counsel arrived, and the Judge being punctual, court was opened at once. The first and probably the only case on the calendar was Uncle Bill's, so the court at once proceeded. Uncle Bill took the stand and gave a detailed account of the pursuit and the capture, detailing his flight across the water and the return, repeated several times; and the "persistent pursuit of the prisoner at the bar," to the great annoyance of himself and his young friends, "some of whom are present as witnesses in this case in behalf of the people." He set forth the great danger liable to himself "by long exposure in the water," which, although a solemn fact, created occasional smiles from the crowd in court, especially when he recounted his trips and those of the officer in pursuit. He next dilated upon his being deprived of his liberty, "that liberty so dear to every citizen, and so much appreciated by myself, through the persecution of the prisoner at the bar" (particular accent being placed upon "the prisoner at the bar," each time repeated). His testimony being in, the defense cross-questioned Uncle Bill at great length, and to each question Uncle Bill detailed the act of "seeking the water for safety," and the necessity of so doing "to protect his person from unlawful seizure," until the court and all within hearing were fully acquainted with the minutest detail of the arrest, and fully comprehended the great wrong done to a citizen of their own commonwealth. Uncle Bill being excused from the stand the boys were, each in turn, called to take the stand, and each in his own simple way gave his account of what he saw, all agreeing as to main facts, but differing in their description and classification as to the particular class of aquatics Uncle Bill's system of propulsion belonged; some called it "wallowing through," others called it "floating," others called it "wading," while one said he "swam in his effort to protect himself from the assault of the prisoner at the bar," giving quite an imitation of Uncle Bill describing the party who pursued him.

It was a great trial, and when the defense were putting in testimony Uncle Bill was prompting his lawyers; and many of the witnesses had to acknowledge having eaten of the fish caught by Uncle Bill and his little party, each admission being accompanied with an "I thought so" from Uncle Bill.

At length the testimony was all in, and the court concluded to hear the arguments, which were begun by Uncle Bill's lawyer, Squire G., who entertained the court and spectators with his account of the great wrong perpetrated upon the people of this commonwealth, "the great danger inflicted upon a citizen whose avoirdupois made it extremely hazardous to his life to be forced to such extreme measures to protect himself from unlawful seizure; a measure which was the studied plot of the prisoner at the bar, that by it something awful to contemplate—death—might happen to the complainant, that he, the prisoner at the bar, might be the beneficiary of such a calamity, a calamity that would be shared by every good citizen for miles around us; a calamity that would cause a whole community to mourn over the loss of one of her most respected members. May it please your Honor, such high-handed outrage calls for the direst extent and severest penalty of the law, and the people of the community, one and all, from the oldest to the youngest, are clamoring among themselves at this great outrage, and as to the fittest punishment for him, the prisoner at the bar. Why, your Honor, is such interest manifested? See the great number of good people present, who have left their work and their homes to be present at this trial, to witness the punishment of the prisoner at the bar; people who have been born and raised neighbors to the complainant, and who are here to testify (if need be) to the many good deeds of this much wronged man; to his sterling character, and the love they bear him; and I might very properly add these sterling qualities of the complainant were well known to the prisoner at the bar, and would not justify him either morally or officially to jeopardize so valued a member of our commonwealth. Revenge of a jealous people, not law, was what actuated this onslaught upon our worthy fellow citizen, the complainant. Official dignity and official duty were set aside, and the prisoner at the bar, unclothed with authority, gave heed to the howls of a mob, who partook freely of the fruits of the labor of the complainant, as sworn to by themselves. We therefore ask of you, in the name of the people, to pass such sentence upon the prisoner at the bar as you in your own mind consider adequate to the great injustice done my client, in accordance to the testimony presented by and in behalf of the people."

The defendant's counsel followed, after unloading a bag of big books upon the table and brushing his hair well back. "Your Honor, may it please the court, we are called upon to present the case of the defendant, in which we claim a great wrong had been done to the people of Rhode Island, the laws of the State had been grossly broken and set at defiance by a party of trespassing people, led by the complainant. During this trespass the proper official was appealed to and his protection asked by the people, and under the circumstances all had been done by the defendant in his official capacity that any man could do. He found the complainant openly defying the law, and demanded his surrender. But he did not obey. He did no surrender. Instead, he, to evade the heavy hand of the law, took to the water in a manner betraying a studied plot to escape in case he was interfered with in his nefarious calling; for once in the water he seemed as much at home as would a duck, and he put on an amount of assurance satisfactory to his aiders and abettors and among whom no doubt of successful escape was expressed. This prudent officer, not daring to bring on an encounter in the water, did the next best thing in his power; he took to the dam. For the purpose of better fixing the true state of affairs in the mind of the court, let us suppose the defendant in pur-

suance of his duty had gone into the water and arrested the complainant when about midway between the shores of that lake, do you, sir, for one moment think that the defendant could have landed him? Your Honor, it was a work impossible for one man. Look, sir, at his size [and here Uncle Bill stood up to the gaze of the court, and looking several times his usual size to me]. Your Honor, it would have taken many times the power of this single-handed man to have effected a capture of that culprit; hence it became a necessity to follow on in the only way left to where the party landed and might be reached in personal safety. That my client did a very wise thing and one wholly legal, I will read, may it please Your Honor, from Parsons, Greenleaf and other cases pertaining to arrests."

Having read the court and nearly a dozen of the spectators to sleep, as nearly as I can recollect, he again took up that portion of the testimony relating to the passages across the dam, after which he made a masterly appeal to the court "to discharge the case under rulings number so and so, as laid down in volume —," names long since forgotten by me. Following this Uncle Bill's "reserve"—as he used to call him in speaking of the case—the ex-Governor, called the attention of the court to several cases from Blackstone and other authorities, which he quoted and applied to the case of Uncle Bill's being deprived of his liberty with such telling effect as to cause the moisture to appear in the eyes of many of our young band, and as he referred to the evidence of the people, "Not a single link in the whole chain presented a flaw, or a question raised against its truthfulness during the entire testimony of the people's witnesses" (nearly all of whom were well filled with Uncle Bill's pouts and cider on the eve of that great dinner and had sworn allegiance to Uncle Bill on that occasion). Why! to talk of eloquence. His eloquence rose higher and higher as he reached the eventful points of his case, until Uncle Bill and his whole band, myself included, were standing and on tiptoe before we knew it; and when he pictured the flight over mud and water to the various points of safety sought by Uncle Bill, we would look around to see if Uncle Bill got there safely. Then with pathetic appeal he would say, "Your Honor, can you conceive of a more aggravated case of imprisonment or a more villainous plot to deprive an honored citizen of his liberty?" Then with soft and tender strains he pictured Uncle Bill "at the bar of justice a prisoner, and a prisoner in the hands of the prisoner at this bar without authority of law. And awful as it might have been had he, my client, been so disposed, your Honor, he could have forced with personal violence his freedom from the clutches of this officer and openly defied the court that held him. This he did not do, as it was not in harmony with the kind heart beating in that manly breast. Your Honor, what did he do? He placed himself under protection of the court and boldly awaited its decision in a most complacent manner and becoming to a liberty-loving citizen like my client; in answer to whose appeal justice heeded and set him free."

After this burst of eloquence he drew his ponderous watch from his pocket and took its standing, then facing the court he said, "It is getting late, and we do not desire to go over more matter, or repeat again and again that which to your Honor must be well understood; so we will submit the case on its merits, believing that you will place the damages sufficiently high to satisfy the people who bring this case before you, for your learned decision."

The case, after dragging through nearly the whole day, was thus submitted to the judge, who after a few moments' deliberation and a short review of the statutes (during which time Uncle Bill was walking around shaking hands, and stiffening up the doubting ones among his friends, who had great confidence in his legal opinion), called the court to order, and in a very appropriately delivered verdict placed the damages at about $200 and cost against the defendant, which the lawyers soon settled up and Uncle Bill and the boys were soon seated at the hotel table ordering the best the house afforded. Uncle Bill paid the bill and promised to divide the chink after the expenses were all paid, which he did afterward with this advise to us boys, "Now that we have the chink, let each one put away his little nest-egg as profit realized for the first sale of pouts to those people living over the line," and it was so put away.

That's all, I now move we retire. It was moved and seconded, and after thanks to brother W. for the part he took in the drama, and his acknowledgment of the wrong in seining, we all adjourned for the night, to meet at early light for our morning sport. SID BROMLEY.

BASS IN SHARK RIVER INLET.

OCEAN BEACH, N. J., Oct. 4.—*Editor Forest and Stream:* In your note from Key East, N. J., in issue of Sept. 29, your correspondent seems very particular in giving your readers to understand that the striped bass fishing is on the Key East side of Shark River Inlet. I admit that the fishing is generally better on that side, but there have been a number of days this summer when the Ocean Beach side was preferable. We will however award the palm to Key East as claimed, but were it not for the Hon. Geo. I. Ferry, Messrs. Napier and Seeley and your humble servent (all summer residents of Ocean Beach), there would hardly have been any better fishing at Key East this year than heretofore. We have been to the expense of having large signs made and set up, advertising in local papers for upward of seven weeks and having two men patrol the beach nights, all to prevent the seiners from hauling; with what success those that have fished can most favorably testify.

Oct. 1 being the end of the season we had the signs taken down. Now mark the result. The enemy swoops down like a hawk on his prey and captures at one haul over 2,500 pounds of striped bass (it sickens one to think of it). Now of course you may fish all day without success, for those that were not caught have been frightened away. I trust that although Key East must be awarded the palm for being generally the best ground, you will in justice let it be known to your readers that the cause was entirely the result of the interest taken by the few gentlemen beforementioned, and who also hope that next summer the same causes will produce like effects. This is a fine bass ground and we suggest that if those who come to enjoy a day's good bass fishing would agitate this question of seining, thus assisting us greatly, the feeling would then soon be such that an attempt to haul would hardly be thought of before Oct. 1, when most people have returned to their winter homes. E. HURTZIG.

ON AN OLD TIME STREAM.

CHARLESTOWN, N. H.—I have done about all my angling in your columns this summer, but have picked up a few trout, entirely with "the festive worm," and have rigged up a fly-cast but once, and even then unsuccessfully.

I had tramped for a couple of times down what in old times was called the "Big Brook," catching perhaps a dozen fingerlings, all of which were returned to the water, and not catching as many more, for the simple reason that I used so large a hook, a No. 1 Limerick, and so generous a bait, that the little chaps usually missed getting hooked—when I met my companion, who was to have fished down from a point below, coming up to meet me, saying that he found other parties ahead of him, and could find no fish worth saving. After a short confab on the subject we decided to eat our luncheon and then drive over to the small river into which the brook falls on its way to the Connecticut, and in which, below a milldam, one or two quite large trout were reported to have been taken a day or two before.

Reaching the river we separated, and I put on a leader with a yellow hackle and a coch-y-bonddu, and tried every available or probable pool, hole or rapid, for over a mile, without a rise. The fact was there was nothing for the trout to live on, the bed of the river was simply clean washed rock and stones, exposed to the sun, with no shelter for insects or worms or any other food.

Such is the case with about all of the streams in southern New Hampshire and Vermont where there is room to cast a fly; they are merely the ragged and exposed beds of the mountain torrents which filled them in the spring, and the smaller brooks are in most cases so overgrown with alders and willows as to render the use of the fly impossible.

This is the case with the "Big Brook" referred to. When I began to fish it, some half a century ago, there was a long open meadow for half a mile above the old farmhouse, where I always started, and an equally open stretch of pasture and corn land below, until the brook reached a long, narrow, deep millpond a mile below, where I was sure of a half-pounder or two on any good fishing day.

How it is changed now! The old farmer and his sons are all gone, the old sawmill has resolved itself into dust, and a few huge stones too heavy to be washed away are left to mark the sight of the old dam. Meadow and pasture are alike overgrown with alders, and there are scarcely a dozen places in the whole long stretch which are accessible to any one but the ubiquitous small boy, who can crawl under the branches of the bushes with a 6ft. pole and a 2ft. line and skin the brook of the few fingerlings that are left. There are long stretches of open hill pasture above and below, where the bushes are not so thick, which I tried with the result above noted.

I have had one day, however, which gave me trout enough for a breakfast, and a tramp over old haunts which I enjoyed. I determined one morning in June to try a once favorite brook across the river in Vermont, which I had not seen for many years, but from which, in days long past, I had filled many a good basket. Having secured a boat the day before, I went down to the river to cross, to find out that I had mistaken the mooring, and that the boat was half a mile up the river. Up the bank I went, to find out when I reached the boat, that I had got the wrong key; and leaving my net and basket, I climbed the hill to the village, about a quarter of a mile off, and getting the right key, finally reached the landing on the opposite side of the river about ten o'clock, or a little later. I saw some one standing on the bank above me as I made fast the boat, and on climbing the bank was accosted by an elderly individual of bucolic appearance, with the query "Goin' fishin'?" I told him I thought of it, when he picked up an ancient rod out of the grass, and informed me that he "would go with me." He said that he had brought down his grand-daughter with him, from somewhere, within a few miles to get her father, who was working for the man who owned the farm at the landing, to take him home for Sunday, and as it was too early to go home, he would go "a-fishin'" with me. I did not think it worth while to offend the sociable old chap by declining his company, so off we started, the old man, the little girl, and I, up the steep hill, which there separated the river from the brook, which empties into it about two miles below.

The girl luckily found her father at work in a field nearly at the top of the hill, and left us, and we kept on until, on reaching the little valley of the brook, the old man made a rush for the bridge, unwinding his line from the top of his rod as he went as actively and eagerly as if he was only ten years old. I turned up the brook about an eighth of a mile, through what was once a good stretch of open pasture, where I have formerly caught many a trout, but I now found it so overgrown as to be impracticable, and finally reached a meadow which was in old times the "bonanza" of the brook. Here I sat down in the grass, put my rod together, and had basketed two or three pair trout, when by me came the old granger, post haste to get ahead of me—which he did, and kept there. I caught two or three more trout before reaching an alder tangle, which utterly covered three-quarters of the lower meadow. Giving up the brook here I went around the alders, and on reaching the upper meadow, which had been ditched, and all the old "holes" spoiled, I missed my companion, but not for a long period. I had scarcely got at the ditch, and found a deep spot in which I got another trout, when by me he went again! either coming up through the alders, or going round on the opposite side from the corner I took.

Then I let him go ahead, merely working up through the meadow and the pastures beyond, until I reached a sidehill, once covered with wood, down which the brook came, and where there used to be some good holes. I found the wood all cut off and the sidehills bare and open to the sun, and came to anchor against a big stump, and lighted my pipe. I had gone up the brook much further than I intended, and missed the lunch which I forgot to bring with me, but the pipe had to answer the purpose, and after a good smoke I turned back over the ground which the old chap had fished coming up, and getting one or two more trout for the basket, and throwing back some little ones, until I reached the upper meadow, when by me came old "Rusticus" again like a race horse, and took the lead and kept it, for I did not see him again. I worked quietly down to where I started and then came back to the river.

As I reached the farmhouse at the landing, the farmer, an old acquaintance of mine, came out as I sat down by the spring for a drink, with the greeting of "What luck?" "Not much," said I, "about a dozen." "Why," said he, "that other man got thirty-five!" "All right, he ought to, he has kept ahead of me all day." Meanwhile the farmer opened my basket, which I had taken off at the spring, and holding up his hands said, "Well! I'd rather have your string than his, by a long chalk." My No. 1 Limerick and a big bait had secured me fifteen trout from 7 to 9in. long, and a good breakfast, while the old granger had been pocketing the fingerlings. VON W.

NEW JERSEY COAST FISHING.

THE season for hook and line fishing along the coast of New Jersey is about over. Drum and sheepshead fishing has been a comparative failure. A few years ago, from the 10th of May to the 1st of June, from Barnegat Inlet to Cape May and in the Delaware Bay, drum were numerous and could readily be taken with the hook and line, especially off Fishing Creek. There with an old fisherman, Hugh Holmes, well known to many sportsmen, we caught 28 drum in one day; their weight were from 25 to 80lbs., averaging about 40lbs. The largest one weighed 105lbs.; it was the largest I ever caught. This season very few have been caught there or along the Jersey coast, almost all have been caught in the surf. Formerly they were numerous in the sounds.

I have found only two kinds of drum along this coast, the light colored drum which are the big kind, and the small drum weighing from 10 to 15lbs., sometimes called sheepshead drum from having bars across them like sheepshead. Whether they are young drum or a small race I cannot answer. I never found roe in them. There are black drum which I have only found in the lagoons of southern Florida. They are found mostly in the Mosquito Lagoon, are jet black and appear very nasty and dirty, and are not used for food.

The fish that are called red drum are not drum; they do not make the drum sound from which drum takes its name; do not even croak or make a gutteral sound, nor do they resemble a drum; but in shape they are more like the striped bass. In Eastern Florida they are called channel bass. They are really the spotted redfish of the South. They are red on the back, white on the belly and have from one to three black spots on the butt of the tail and sometimes on the sides, resembling the spot on a peacock feather. They have upper and lower rows of very fine teeth and readily take fish bait, which is not the case with the drum. I have caught them weighing from 2 to 50lbs. They give good sport with the rod and reel.

Why drumfish has disappeared from the coast is a question. Whether it is that there must be a change in the waters or in the state of the bays where they used to come in the season to spawn, or have taken some other course more congenial to them or have been gobbled up by the purse-net of the fish factory we cannot tell. I have been informed that 25 tons of drumfish have been caught at one haul by those nets off Little Egg Harbor, about spawning time. If such netting has been continued the parent fish must have been destroyed or there would be some offspring; certainly no drumfish have been caught in those bays for some years. This may account for their disappearance. The people living on the southern coast of New Jersey will regret the disappearance of drum. Although not the best fish, they are good and cheap food, and salted down for winter use are much better eating than snowballs or icicles. PURVES.

PHILADELPHIA.

A RANGELEY LANDLOCKED SALMON.

PHILADEDPHIA, Pa., Oct. 10.—*Editor Forest and Stream:* It may interest the readers of FOREST AND STREAM to learn that on Monday, Sept. 26, I took a landlocked salmon in the Rangeley Lakes (near the end of the lake at Greenvale) which weighed 7¼lbs., a profile of which I send herewith. I used an ordinary 7oz. fly-rod, small linen line, 6ft. leader, dark Montreal, and a light-colored fly, the latter being the drop, which he took in a manner that showed that he meant business.

I was alone in the boat with anchor out in about ten feet of water. Near the stern of the boat was an old stub which projected above the surface of the water, which together with the anchor rope and shallow depth of water, compelled me to land the fish without giving him much line, although he called for more several times in his frantic leaps to get clear of the difficulty he seemed to be in.

Knowing that I had him well fastened, I proceeded to hoist anchor, in order, if possible, to give him more sea room. Having got the anchor into the boat, I found the wind was taking me toward shore, where the water was even more shallow, and I was therefore obliged to land my fish at once, which I proceeded to do safely.

I do not know long I was in getting the salmon into the boat, as I had no opportunity of measuring time after he took the fly. Several gentlemen were present, also a lady, in company with her husband, and they may have noted the time.

This is said to be as large a salmon as was ever taken from the Rangeley Lakes with fly. A fish of the same size and kind was taken a few days before in the Kennebago Lake by a young gentleman from Massachusetts, whom I had the pleasure of meeting, and upon comparison of profiles of the fish, we concluded them to be of the same age.

This salmon made more business for me to attend to in a short time than any fish ever did before. L. A.

MR. T. H. CHUBB of Post Mills, Vt., manufacturer of fishing rods, etc., appeared in New York last week with a full line of samples, the first time he has shown any in twelve years. Mr. Chubb's specialty is the jobbing trade though he makes fine goods for retail trade. His line of samples comprised rods of all kinds, brass and wood landing nets, brass rod trimmings, camp chairs, etc., etc. Mr. Chubb has a large factory 120x32 with an ell 24x30, beautifully located on the Onpompanusic River at Post Mills, Vt., employs about sixty hands and is not troubled with a lack of orders. He is something of a politician, having represented his district one term in the Legislature, but his ambition does not lie in this direction. He prefers to be known as Chubb, the rod maker, and we believe has already attained fame in this direction.

BLACK BASS FOR STOCKING.—Camden, Carroll County, Ind., Oct. 5.—*Editor Forest and Stream:* My memory is singularly defective, or else it is unusual to find black bass full of spawn at this season of the year. Is it my memory? My last catch found all the female fish with spawn. Is there an established price for black bass for stocking purposes? Parties desiring some can receive information from me on how to get them and where. I ask nothing.—JOHN P. HANCE.

Fishculture.

LOBSTER CULTURE.

MR. RICHARD RATHBUN, Curator of the Department of the Invertebrates of the National Museum, contributes the following to the Bulletin of the U. S. Fish Commission:

The partial completion in August last of the new laboratory building at the marine station of the Fish Commission at Wood's Holl, Mass., with its convenient system of salt-water piping, permitted the necessary experiments being begun at that time with respect to the artificial hatching of lobsters, a branch of fishculture the great importance of which has long been felt, in view of the rapid decrease in abundance of that valuable food product. Unfortunately the hatching season had then closed, but it was deemed advisable to ascertain the best methods of handling the eggs, in order that there might be as little delay as possible in starting operations next spring.

Unlike most fishes, the lobster carries its eggs until they hatch. The eggs are fertilized while yet in the ovaries, and are soon afterward extruded, but the length of the period of development is not known. As they issue from the body of the female they are coated with a viscid substance that soon hardens into short, tough and very flexible threads, by means of which they are attached in bunches or clusters of variable sizes to the swimmerets and under surface of the abdomen or tail, the hinder feet, it is said, being used to aid in carrying them back and distributing them as they come from the apertures of the oviducts. The eggs are comparatively large (about one-twelfth of an inch in diameter) and hardy, and each lobster carries from about 12,000 to 24,000, according to its size.

The problem of lobster hatching on a practical scale is one that the Fish Commission has long had in view, but all of its marine laboratories up to the present time have been temporary structures, with insufficient accommodations and without the means of obtaining continuous supplies of water in suitable quantities. It was hoped that the new building would be finished early enough in the spring to permit of the beginning of hatching work in June, but the hinderances which are inevitable to all such projects interfered to delay actual operations for another year. The hatching of small quantities of lobster eggs, as well as the eggs of other species of crustaceans, had been successfully accomplished from time to time by members of the Fish Commission party interested in embryological studies, and the possibility of conducting hatching operations on a small scale, and of carrying the young through at least the first few stages of growth, needed no further proof; but the question of how to care for large masses of eggs, and especially for the young after hatching, was yet to be approached.

In the fall of 1884, soon after the inner fish basin at Wood's Holl had been completed, Capt. H. C. Chester, in charge of the station, transferred to it several hundred female lobsters, with spawn, thinking that some of the eggs might hatch during the winter, but if not, feeling certain that something might be done with them in the early spring. Unfortunately for his experiment, the work on the outer basin necessitating the employment of a large steam dredger, which kept the water constantly loaded with sediment, and the frequent blasting of rocks, caused the destruction of his entire stock before any results had been reached. The method of continuing the work in the summer had not yet been decided upon, when an opportune letter, received from the Norwegian fish-culturist, G. M. Dannevig, announced the successful hatching of lobster eggs of the European species, detached from the body of the parent, and the rearing of the young through the three earliest stages. The manner of conducting his experiments was not described, but the fact that he had accomplished good results with detached eggs gave us a basis to work upon. His letter was as follows:

FLODEVIG, near Arendal, Norway, July 14, 1885.

Prof. Spencer F. Baird, Commissioner of Fish and Fisheries:

DEAR SIR—I hereby take great pleasure in informing you that the experiments with the hatching of detached lobster eggs is progressing very favorably, that the young are doing well, and that some of them have attained what Prof. G. O. Sars calls the third stage. The length of the young lobster soon after hatching is about 9mm. After eight days, when the second changing of the shell or skin takes place, it has attained the length of 12mm., and after sixteen days, when the third change occurs, it is about 15mm. The mortality was rather large for some days, but is now only one to three in twenty-four hours, so that ninety-five still remain out of two hundred which were picked out for an experiment. They are very greedy, but not so bad in killing one another as they were in the beginning. I feed them principally with the soft parts of our crab. They like it well, but their slender legs sometimes get entangled in the soft mass, and then they die. Five hundred newly-hatched individuals are now in a separate apparatus for further experiments. I wish to find out at what stage the greateet loss takes place. I have great hopes now that I shall master this question during the season, so that I can proceed upon a large scale next summer. Very respectfully, G. M. DANNEVIG.

If a few eggs are cut from the swimmerets of a lobster and dropped into a jar of water they will rapidly sink to the bottom, showing that their specific gravity is considerably greater than that of water. The knowledge of this fact led to the selection of the McDonald automatic hatching jar, which has long been in use in shad propagation for the first experiments, and a trial of about two months has demonstrated its superiority for this purpose over the other appliances that were tested. The principle on which the McDonald jar works has been fully described and we need only mention here, for the purpose of showing its adaptability to the eggs in question, that the water entering through a long glass tube, reaching nearly to the bottom of the jar, causes an upward current of water through the jar, the force of which is regulated by the amount of inflow; the outlet is by means of a short tube passing only a little way into the upper part of the jar. The inlet tube is connected by rubber tubing with a supply pipe, and the outlet tube in the same manner with a waste pipe, and these connections being made the movement of the eggs is entirely controlled by means of a stop-cock and the longer tube, the latter by being raised or lowered changing to a certain extent the force and character of the current. The flow is continuous and regular and the jars need to be examined only occasionally, perhaps twice each day for the purpose of forcing out the accumulation of sediment as explained further on.

The eggs are readily cut from the swimmerets and under surface of the lobster by means of small, sharp scissors, the curved kind used in dissecting being especially well adapted to this purpose, although most any kind will answer. By taking ordinary precautions no harm is done to the parent, the small threads joining the eggs to the body having no organic connection with it. Most of the eggs come off in bunches of variable sizes, some containing two or three hundred, and others less, down to a very small number; but more or less of them become separated in the cutting, and in every bath there are many free eggs. This lack of uniformity in the composition of each lot of eggs is a source of great annoyance in handling them, the free eggs floating up more readily than the bunches, and tending to escape through the outlet pipe; but it is not detrimental to the success of the work. In preparing the eggs, they were transferred as rapidly as detatched to the hatching jars, previously filled with water, the eggs of each lobster being placed in a separate jar, as there is more or less variation in the specific gravity of the eggs of different individuals.

As soon as each jar had received its allotment, the cap with its tubes was fastened on, and a connection made with the salt water supply pipe. The specific gravity of the eggs was not determined, but they require a relatively strong current of water to raise them above the bottom, the average amount allowed to pass through the jars having been nearly a gallon a minute for each. The flow was so regulated as to give the larger bunches of eggs a gentle rotary motion, but this caused the smaller bunches and the free eggs to rise sometimes to more than half the height of the jar, and kept them quite strongly agitated. Although the eggs are very very hardy, and in nature, while attached to the swimmerets of the parent lobster, are given but little motion, this greater activity appears to be essential to their well-being in this artificial hatching apparatus, for without it they soon die. Such fate befell most of one lot contained in a McDonald jar, through which but a gentle current was allowed to pass, and in one of the hatching boxes, where the supply of water was very much greater, though distributed over a much larger surface, so that no motion was given to the eggs, they all died inside of a week. The accumulation about the eggs of impurities from the water may have been the principal cause of this mortality, but as the eggs are well able to endure active motion, and thrive best in a strong current, there can be no objection to pursuing that method. An illustration of the hardy character of the eggs is furnished by the fact that a small quantity left over night in a watch glass of sea water were alive and apparently in good condition in the morning, although the density of the water had been greatly increased by evaporation.

The chief annoyances to hatching work at the Wood's Holl station this summer were, first, iron rust, and second, sediment from the harbor. The supply mains in use when the laboratory was first opened consisted of iron pipes without a protective lining. They had been down a year, and gave off such a large quantity of rust, which often appeared as a dense reddish cloud of exceedingly fine suspended particles, that the hatching jars would become strongly stained inside of a few hours, and the eggs themselves become perceptibly coated. After the cement-lined pipes had been substituted, this trouble ceased for the most part, but a great deal of sediment was observed in the sea water the remainder of the season, and notwithstanding the strong current passing constantly through the jars, a very perceptible deposit was formed over the lower-lying eggs in the course of every twelve hours. The lighter particles of sediment also collected to a large extent on the sides of the jars and tubing, and often adhered to the more buoyant eggs. Cloth filters were used to strain out these impurities, but they proved unsatisfactory, and the course finally pursued was to force out the sediment every morning and evening by momentarily increasing the flow of water to its utmost capacity and then shutting it off, repeating this operation at intervals for several minutes. The effect was thoroughly to stir up the sediment, which, being lighter than the eggs, remained longer in suspension, and was carried off when the flow was again made normal. The eggs were transferred to clean jars every four or five days, and the old jars thoroughly washed.

By constant attention to all these details, the eggs were kept in a healthy and tolerably clean condition as long as the experiments were kept up. A neglect of these precautions always resulted in the destruction of many eggs, although in the first lot of eggs prepared, which suffered greatly from iron rust, and was frequently left without care, sometimes for days at a time, until they were well covered with sediment, fully one-third were living at the end of eight weeks, when I left the Wood's Holl station.

It does not seem practicable to keep the eggs of more than one lobster in each jar, as the eggs of different individuals differ more or less in specific gravity, and it is impossible to regulate the flow of water so as to give them all the required motion; but as the number is considerable in each, there is not sufficient excuse for attempting economy in that direction. The number of fertilized eggs carried by lobsters during the spawning season has been ascertained by careful computations in several cases, and varies from about 12,000 to 24,000, the latter number being rare. The most common number noticed during late years has been from 15,000 to 18,000.

The question of the amount of motion to which the eggs should be subjected is one deserving much consideration. The females with eggs contained in the aquaria at Wood's Holl remained very quiet most of the time, and the swimmerets and eggs were scarcely ever observed to be in motion. Confined within the narrow limits of an aquarium, with a strong light entering from all sides, it was not to be expected that their movements would be altogether natural. In nature, whether or not their swimmerets are kept moving regularly backward and forward, which is probably the case to a greater or less extent, the act of moving about in search of food or for change of ground must bring constant change of water. With the Clark hatching boxes, which are very successful for certain kinds of fish eggs, no good results were obtained, although the flow of water was much greater than in the McDonald jars. These boxes were tried in two ways, with a downward and an upward flow of water, but the eggs remained perfectly motionless, and at the end of a week were in such bad condition that they had to be thrown away.

The experiments above described merely indicate a method by which lobster eggs detached from the parent may be successfully kept alive for a considerable length of time with sufficient economy to commend the process to future practice. Had the experiments been made during the hatching season, more satisfactory results would undoubtedly have been reached. It is not expected that in actual practice the eggs will have to be kept very long in the jars. The extensive storage basins in front of the laboratory will afford accommodations for large quantities of "berried" females, which can be so arranged as to permit of their being readily examined from time to time, and the condition of the eggs observed. As the eggs approach the last stages of development before hatching—a condition that is easily determined almost by the unaided eye—they can be transferred to the hatching jars, and the final changes allowed to take place under constant observation. As the hatching is limited to a period of about two months, it is probable that the eggs of many individuals reach maturity at about the same time, and a large number of jars can be manipulated together.

The principal object in hatching the eggs in jars is to have the embryos under control immediately after hatching, but the best methods of caring for the young have yet to be decided upon, and furnish an interesting problem for investigation next spring. It is probable that the embryos cannot be kept in the McDonald jar, as they swim at the surface and would soon all escape through the outlet tube. They can, however, be transferred to large aquaria, to the large wooden tanks now rigged on the lower floor for the keeping of fish, or to floating cars in one of the basins. The last plan will probably answer best when working on a large scale, as the embryos will thereby obtain some food from the surrounding waters, while in both of the former cases food would have to be supplied them.

A floating car suitable for the purpose has already been constructed and now contains a number of "berried" lobsters, which it is proposed to keep over winter if possible, in order to observe whether any hatching takes place during that season. This car is constructed on the plan of the ordinary fish cars, the openings being covered with a fine mesh brass-wire cloth to prevent the escape of the young, but with meshes large enough to permit of the entrance of such small life as the embryos would be likely to feed upon at the surface. The dimensions of this car are 5ft. long, 3ft. wide and 2ft. deep, but larger cars will be used if necessary. It is now moored in the outer basin, opposite one of the openings of the wall, where it receives the full force of the current. A few McDonald jars will also be kept in operation with lobster eggs during the entire winter, for purposes of observation.

It is not known how long the young can be kept in confinement, nor at what age it would be advisable to turn them over to the care of nature, but it will probably be possible to transport them alive to any other portion of the eastern coast, as the distances are nowhere great.

THE NEW YORK SHELLFISH COMMISSION.—At a recent meeting of the board of shellfish commissioners Hon. E. P. Doyle was appointed clerk of the board. The commissioners are meeting in New York city on the first of every month, and are arranging to lease a portion of the oyster territory before the year closes.

DOG SHOWS.

Oct. 12 and 13.—Third Annual Show of the Stafford Kennel Club, Stafford Springs, Conn. R. S. Hicks, Secretary.

Dec. 6 to 8.—Third Annual Dog Show of the Central Berkshire Poultry, Pigeon and Pet Stock Association. W. T. Webster, Secretary, Lee, Mass.

Feb. 21 to 24, 1888.—Twelfth Annual Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent.

FIELD TRIALS.

Oct. 17 to 22.—Second Annual Meeting of the American Coursing Club, at Great Bend, Kan. G. I. Royce, Secretary, Topeka, Kan.

Nov. 7.—First Annual Field Trials of the Indiana Kennel Club at Bicknel, Ind. Open to dogs owned in Indiana. P. T. Madison, Secretary, Lock Box 4, Indianapolis, Ind. Entries close Oct. 25.

Nov. 7.—Third Annual Field Trials of the Western Field Trials Association. R. C. Van Horn, Secretary, Kansas City, Mo.

Nov. 21.—Ninth Annual Field Trials of the Eastern Field Trials Club, at High Point N. C. W. A. Coster, Secretary, Flatbush, Kings County, N. Y.

December.—First Annual Field Trials of the American Field Trials Club, at Florence, Ala. C. W. Paris, Secretary, Cincinnati, O.

Jan. 10, 1888.—Second Annual Field Trials of the Texas Field Trials Club, at Marshall, Tex. W. L. Thomas, Secretary, Marshall, Tex.

Jan. 16.—Fifth Annual Field Trials of the Pacific Coast Field Trial Club, near Kingsburgh, Cal. N. P. Shelden, Secretary, 320 Sansome street, San Francisco, Cal.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **5400.**

MASTIFF TYPE.

Editor Forest and Stream:

Although "X." desires to avoid controversy with either Mr. Wynn or me, I must ask him to prove some of the things he says. If mastiff breeders are breeding forward to an ideal dog, what is that ideal? The standard says "square muzzle, forming a right angle with upper part of nose" and "bent hocks," yet Crown Prince, all the "lady" lot of Dr. Turner's bitches, Ilford Caution, Rosalind, etc., have or had undershot muzzles and straight hocks! This must be a Pickwickian ideal. What is the present method of breeding? Is it that which drove Mr. Hanbury, Rev. Mellor and Col. Garnier out of the O. E. Mastiff Club? Listen to what the oldest living mastiff breeder says: "I do not wish to be identified with those who go in for the bulldog, goggle-eyed type, with straight stifles, narrow chests, hollow backs, and who require keepers to lift them on a two-foot show bench. We have very few real mastiffs now; they seem to have lost all intelligence and sagacity, and are fit for nothing but eating and sleeping."

"X.'s" "well-known judge" showed his incapacity in the most marked manner, if we are to understand from "X." that this judge gave Ilford Caution any place whatever, first or last, from a consideration of what his stud value might be. A judge passes on a dog as a specimen, pure and simple, and allowing such considerations as his probable value in the stud to enter into consideration, is simply swindling the exhibitors. A show is not one of stud dogs, but of specimens. If my "violent prejudice" against Ilford Caution was what impelled Mr. Moore to import that almost perfect specimen, Minting (I lack the conceit to hope that it was), then American mastiff interests owe me more for this than for all else I ever did, or may be likely to do.

"X." forgets that underneath all discussions as to mastiff type, lies the question of what this type is. What the standard of the O. E. Mastiff Club says, suits me well enough, and if judges would only honestly interpret it, there would be no cause of complaint, but to set down in black and white that such and such characteristics are requisite in a perfect mastiff, and then deliberately ignore them because a few followers of fashion, trying to lead it, have exalted snub noses above everything else, is something that does not go down well with the man of average common sense.

If fanciers will only openly admit that fashion is their only ruling star, that all they care for is what Mrs. Grundy will say, we can smile at their vagaries, but when they tell us that the direct contradiction of their own standard is "the real thing," "the correct type," etc., it is time to rebel. Would "X." undertake to establish by any number of shows, judges, etc., what is "the correct type" in bustles?

W. WADE.

HULTON, Pa., Oct. 8.

WESTERN FIELD TRIALS.—Kansas City, Mo., Oct. 9.—*Editor Forest and Stream:* The executive committee of the Western Field Trials Association has extended the time for receiving entries for the All-Aged Stake to Oct. 22.—R. C. VAN HORN, Secretary.

EASTERN FIELD TRIALS ENTRIES.

FOLLOWING is a list of the entries for the All-Aged and Champion Stakes of the Eastern Field Trials Club:

All-Aged Setter Stake.

ENGLISH SETTERS.

KEYSTONE (Washington Kennel, Pittsburgh, Pa.), black, white and tan dog, June 27, 1885 (Gladstone—Sue).

ALBERT OF MONTEBELLO (W. T. Barnard, Baltimore, Md.), blue belton English setter dog, April (Royal Albert—Beauty Queen).

QUEEN OF MONTEBELLO (W. T. Barnard, Baltimore, Md.), black and white English setter bitch, September (Count Howard—Sandal).

RACHEL (John E. Thayer, Lancaster, Mass.) liver and white pointer bitch, July 8 (Dean—Floy).

TWO UNNAMED (Dr. J. N. Maclin, Keeling, Tenn.), particulars not received.

BRISTOL DOG SHOW.

BRISTOL, Conn., Oct. 1.—*Editor Forest and Stream:* An inaugural dog show was held in connection with the Bristol Park Agricultural Society's first annual fair, and was an improvement over some where they have had more experience. The benching was done in a very thorough manner, and the stalls were large and comfortable. The dogs had excellent attention and were fed on Challenge food. Great credit is due to J. S. Barnes, the superintendent, who was very attentive to all. There were about sixty entries. Although the show was small some of the finest specimens were present. Mr. E. K. Sperry judged all classes. The following is a list of the

AWARDS.

MASTIFFS.—1st and 2d, E. A. Carley. Very high com., D. P. Barnes.

ST. BERNARDS.—ROUGH-COATED—1st, Mrs. A. Fatkins; 2d, Dwight Barnes. Very high com., W. F. Kenney. *Puppies:* 1st, D. P. Barnes.

POINTERS.—*Dogs:* 1st, James Barnes; 2d, F. E. Lee. Very high com., W. Barnes. High com., J. E. Bair. Com., B. Wallace. *Bitches:* 1st, Fred Stengling; 2d and very high com., W. B. Martin. High com., F. E. Lee. *Puppies:* 1st, W. B. Martin; 2d, F. E. Lee.

ENGLISH SETTERS.—*Dogs:* 1st, A. J. Lee Southington; 2d, Mrs. A. F. Atkins. Very high com., J. E. Hair. High com., Jas. Miles. *Bitches:* 1st withheld; 2d and very high com., A. J. Pierre. High com., J. E. Mills.

IRISH SETTERS.—*Dogs:* 1st, C. F. Nason; 2d, F. E. See. Very high com., J. F. Hines. *Bitches:* 1st, J. F. Hines; 2d, Watkins. *Puppies:* 1st and 2d, Watkins and Cheney.

FIELD SPANIELS.—1st and 2d, J. J. Casey.—*Puppies:* 1st, J. J. Casey.

BEAGLES.—1st, Wallace Muzzy; 2d, G. M. Strom.

COLLIES.—*Dogs:* 1st, W. J. Sames; 2d, H. Whalen. Very high com., W. H. Atwood. High com., J. B. Brown. *Puppies:* 1st, W. G. Manchester.

BULLDOGS.—1st and 2d, C. D. Cugle. Very high com., E. Grace. *Bitches:* 1st and 2d, C. D. Cugle. Very high com., T. M. Atwood. *Puppies:* 1st, C. D. Cugle.

FOX-TERRIERS.—1st, A. H. Norton; 2d, J. M. Farris. Very high com., A. H. Norton. *Puppies:* 1st, A. H. Norton.

BLACK AND TAN TERRIERS.—1st, John Coulon.

NEWFOUNDLAND.—1st, G. M. Strong.

COON DOGS.—1st, J. Fairclough. *Puppies:* 1st, J. Fairclough.

[The above list is given for what it is worth, its merits as a record being impaired by absence of dogs' names.]

SKYE TERRIER IMPORTATION.—Mr. German Hopkins upon his recent visit to England purchased a pair of Skye terriers and brought them to this country. The dog Benmore is a light blue drop-eared, was whelped May, 1884, and is by Lochiel out of Jean. The bitch, Highland Mary, is a dark stee lgray, prick-eared, was whelped Jan. 6, 1886, and is by Prince Charlie II. out of Tottie. Both have done a lot of first class winning in England, their last score being a first for each in their respective classes at the recent Jubilee show at Barn Elms. We understand that they were not purchased for the purpose of exhibition, but it is to be hoped that their owner will gratify lovers of the breed by entering them at some of the spring shows.

IRISH SETTER CLUB'S FIELD TRIALS.

Editor Forest and Stream:

Will the members of the Irish Setter Club kindly forward their dues for 1887 to the undersigned in order that the stakes for the field trials of 1887 may be arranged. A good start was made last year, but unfortunately the deep snows prevented the running of the trials. The club hopes for better luck this year and a larger entry even than last, as the stakes will be well worth competing for. Now let every admirer of an Irish setter put his shoulder to the wheel and the trials of 1887 will be brought to a successful termination.

WM. JARVIS, Sec. and Treas.

CLAREMONT, N. H., Oct. 7.

TRANSPORTATION OF DOGS TO TRIALS.—*Editor Forest and Stream:* It is with most sincere pleasure that I forward you a copy of the letter sent in answer to my request to accord the club the same privileges for 1887 as in the past in the free transportation of dogs. The letter is as follows: "Piedmont Air Line, Washington, D. C., Oct. 4.—W. A. Coster Esq., Sec'y E. F. T. Club: Dear Sir—I beg to acknowledge your favor of 30th ult. and to say in reply that we will take great pleasure in extending over our system the same privileges of free transportation that we have previously accorded; and will also bring the matter up in the Southern Passenger Association, which covers the territory south of the Potomac and Ohio Rivers and east of the Mississippi, to obtain if possible the same from all the lines within that jurisdiction. We take a great interest in the success of your club and will be pleased to do what we can to forward its interests. Very truly, Jas. L. Taylor, G. P. A." The roads to which this applies are Richmond & Danville, Atlanta & Charlotte, Virginia Midland, South Carolina, Columbia & Greenville, Western North Carolina, Washington & Ohio. I regret to add I am in receipt of a communication from the Pennsylvania Railroad, and they refuse to grant us a continuation of these privileges as in past.—W. A. COSTER, Sec'y E. F. T. C.

SPANIELS AT MILWAUKEE.—Brantford, Oct. 9.—*Editor Forest and Stream:* An error occurred last week in your published list of prizes won at the late Milwaukee bench show. In the cocker dog class you give Rufus first and special, and Mike second. It should have been Mike first, Rufus second and Juno W. first and special. Kindly make the correction to avoid any misunderstanding in the future.—CHAS. M. NELLES.

AMERICAN KENNEL CLUB.—President Child of the American Kennel Club has appointed as committee on credentials Messrs. N. Seabury, Providence, R. I.; J. O. Donner, and T. H. Terry, New York; on Stud Book, Messrs. C. J. Peshall, Jersey City, N. J.; T. H. Terry, New York, and J. H. Winslow, Philadelphia, Pa.

AMERICAN FIELD TRIALS.—Cincinnati, O., Oct. 10.—*Editor Forest and Stream:* The American Field Trial Club have decided that entries to the All-Aged and Champion Stakes shall close Nov. 1 instead of Oct. 10.—C. W. PARIS, Secretary.

WESTERN FIELD TRIALS.—Kansas City, Mo., Oct. 5.—*Editor Forest and Stream:* Messrs. John W. Munson, Theodore Mosher and Louis Kunz will judge the Western Field Trials.—R. C. VAN HORN, Secretary.

PUPPY SWEEPSTAKES.—The *Sporting Life* announces that the Philadelphia Kennel Club will open sweepstakes for puppies of each of the prominent breeds to be decided at their show next spring.

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Nat Taylor. By A. McDonald, Rockland, Me., for black and white ticked English setter dog, whelped May 20, 1887, by Latchstring (Gus Bondhu—Donna) out of Kate (Cambridge—Bessie).

Flossie Dale. By A. McDonald, Rockland, Me., for orange and white English setter bitch, whelped March 8, 1886, by Frank Dale (Grousedale—Lady Thorn) out of Bessie (Jim—Dot).

Little Nat, Poppy, Dot Homer and Bessie Jenkins. By A. McDonald, Rockland, Me., for black cocker spaniels, one dog and three bitches, whelped July 26, 1887, by Earl (Obo, Jr.—Black Garrie) out of Maud St. J. (Sandy—Liversweet).

Sam Bird, Reta Bird, Dave Bird, Harry Bird and Kitty Bird. By A. McDonald, Rockland, Me., for liver and white ticked pointers, four dogs and one bitch, whelped May 7, 1887, by Beaufort II. (Beaufort—Nellie Bird) out of Hazel Bird (Fritz—Bird).

Albert F. By Benj. A. Gage, Pawtucket, R. I., for black, white and tan English setter dog, whelped Sept. 5, 1887, by Royal Albert (Sir Alister—Novelty) out of Fortuna (Foreman—Grace B.).

Kelp's Trump, Kelp's Beauty and Kelp's Doll. By Detroit Kennel Club, Detroit, Mich., for white, black and blue belton English setters, one dog and two bitches, whelped July 25, 1887, by Pride of Dixie (Gladstone—Countess Druid) out of Kelp (Prince Rob—Kate Jewell).

Kelp's Pride, Kelp's Girl, Kelp's Jewell and Kelp's Pet. By Detroit Kennel Club, Detroit, Mich., for blue belton English setters, one dog and three bitches, whelped July 25, 1887, by Pride of Dixie (Gladstone—Countess Druid) out of Kelp (Prince Rob—Kate Jewell).

King Bow's Boy, King Bow's Dot, King Bow's Dawn and King Bow's Lass. By Detroit Kennel Club, Detroit, Mich., for liver and white ticked pointers, one dog and three bitches, whelped July 20, 1887, by King Bow (Bow—Taffee) out of Ruby Croxteth (Croxteth—Seltner's Lass).

Foreman's Nathan and Foreman's Nora. By C. Fred Crawford, Pawtucket, R. I., for black, white and tan English setter dog and bitch, whelped May 29, 1887, by Foreman (Dashing Monarch—Fairy II.) out of Nellie II. (Count Noble—Rosalind).

Foreman's Naboh and Foreman's Ne-Paul By C. Fred Crawford, Pawtucket, R. I., for lemon and white and blue belton and tan English setter dogs, whelped May 29, 1887, by Foreman (Dashing Monarch—Fairy II.) out of Nellie II. (Count Noble—Rosalind).

Albert's Flash, Albert's Fairy and Albert's Fancy. By C. Fred Crawford, Pawtucket, R. I., for English setters, one lemon and white dog, one lemon and white and one blue belton bitch, whelped July 8, 1887, by Royal Albert (Sir Alister—Novelty) out of Fairy Belle (Plantagenet—Fairy III.).

Albert's Flirt, Albert's Fame and Albert's Fern. By C. Fred Crawford, Pawtucket, R. I., for black and white English setter bitches, whelped July 8, 1887, by Royal Albert (Sir Alister—Novelty) out of Fairy Belle (Plantagenet—Fairy III.).

Bross. By Detroit Kennel Club, Detroit, Mich., for black, white and tan beagle dog, whelped July 11, 1887, by Prince (Ringwood—Roxy) out of Reta (Rolf—Katy).

Ethan Allin. By S. T. Hammond, Springfield, Mass., for white, slate and tan Ethan Allin setter dog, whelped Aug. 6, 1887, by Bogue out of Nelly.

Roxy III. By Detroit Kennel Club, Detroit, Mich., for black, white and tan beagle bitch, whelped June 19, 1887, by Dan (Rattler—Katie) out of Roxy II. (Prince—Spider).

Queen Naso.—Editor Forest and Stream: In your last issue the Greenfield Kennels claimed the name Queen Naso. That name was claimed in FOREST AND STREAM nearly eighteen months ago for a bitch puppy by champion Nick of Naso out of my bitch Devonshire Queen, and won a prize at Waverly show, 1886, under that name. To avoid confusion, I would suggest to the Greenfield Kennels that it would be better for them to select another name for their bitch.—FLOYD VAIL (New York, Oct. 7).

Irvington Kennels. By V. E. Macy, Irvington-on-Hudson, N. Y., for his kennels.

BRED.

☞ **Notes must be sent on the Prepared Blanks.**

Princess Novel—Royal Albert. Eugene Austin's (East Providence, R. I.) English setter bitch Princess Novel (Count Bondhu—Nellie B.) to C. Fred Crawford's Royal Albert (Sir Alister—Novelty), Sept. 21.

Royal Naso. Liver and white pointer dog, whelped Aug. 4, 1887, by Mort of Naso out of Devonshire Queen (A.K.R. 3127), by Floyd Vail, Jersey City, N. J., to John T. Andaricse, same place.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

M. F., Albany.—My dog, aged two years, for some time past has had a hard wart-like substance on the elbows of both fore legs. It does not seem to bother him very much, but looks very bad. Ans. Consult a veterinary and see if it can be removed.

W. S. G., Red Cloud, Neb.—Will you please direct me how to treat my pointer puppy, 6mos. old. Appetite good, but puppy is thin; lively and active most of the time, but at times in distress, evidenced by outcries and rolling upon the ground. It often assumes the position—forelegs extended with chest upon the ground, hind parts erect. Have treated it for worms, using areca nut and santouin. Got an abundance of the tape worm after first dose. Two weeks after gave another dose, don't think any were passed. That is now two weeks ago and the pup is still subject to attacks of depression and abdominal pains. Ans. The pup still has part of the worm in his intestines. Diet with milk and try 10 drops turpentine in teaspoonful of olive oil. This may be repeated for three days. After this give stimulants, a little brandy or whisky and build up with generous diet.

LYNCH'S STATION, Va., Oct. 6, 1887.

U. S. Cartridge Co., Lowell, Mass.:

DEAR SIRS—After a thorough test of your shells, *I find their primers* better suited to develop *Schultze Powder* than any shells made in this country, and shall use them exclusively in my shooting. Yours truly, (Signed) W. T. MITCHELL. —*Adv.*

RANGE AND GALLERY.

THE MASSACHUSETTS STATE SHOOT.

SOUTH FRAMINGHAM, Oct. 6.—The annual rifle contest of the State militia took place yesterday at South Framingham under excellent conditions. Almost 700 militiamen took part in the various contests, representing every branch of the service and every battalion and regimental organization was represented. Even that non-combatant organization, the ambulance corps, was on hand, and for the first time since rifle shooting has become a part of the State military duty the Governor's staff sent up a team, but owing to the modesty of its members their score does not appear in the list of competing teams.

At 8:30 o'clock, when Col. R. T. Rockwell, inspector-general of rifle practice, arrived from Boston, there were nearly 100 men on the ground, and the targets and firing points were found to be ready for the work. The day was clear and a brisk wind from about 3 o'clock blew across the range, promising trouble for those teams that were to shoot first. With Col. Rockwell came a large number of officers who were to assist in carrying out the details of the contest. Among them were Col. A. N. Sampson, Maj. C. W. Hinman, Maj. J. P. Frost, Capt. J. B. Osborn, Capt. A. A. Hall, Capt. F. H. Briggs, Capt. W. L. Chase, Lieut. R. B. Edes, Lieut. S. S. Bumstead, Lieut. W. A. Hayes, Lieut. J. F. Parker, Lieut. J. P. Reardon, Lieut. W. G. Hussey, Lieut. H. G. Wood, Lieut. W. H. Merritt, Lieut John Bellamy, Sergt. W. M. Merrill.

As promptly as was possible trigger pulls were tested, the men were mustered and assigned targets, and at 9:35 the first shot was fired. It was a bullseye, and strange to say, the last shot fired on the range also brought out the white disc. The conditions of the match were:

Each company team will consist of seven members and one substitute (officers permitted on the team), and will be under command of a commissioned officer. The staff teams will consist of five members and one substitute (officers and non-commissioned officers attached to any headquarters being eligible). No person will be eligible unless mustered in previous to Aug. 1, and unless he has performed at least one-half of all State duty to which he has been liable during the year.

In the team competition the number of rounds to be fired per man will be seven, without sighting shots. Competitors will provide their own ammunition. The rifles must be those used by the State, with sights properly pertaining to the piece. No person may use a rifle not belonging to his headquarters or company. Rifles must not be wiped during the competition. Minimum trigger pull, 6lbs., to be tested. Position, standing. Violation of any rule, or any act of carelessness, will debar the offender. Any team or competitor aggrieved by a decision of the executive officer may enter a protest with him, and he will forward the same to the adjutant-general. No challenges of marking or non-marking will be permitted, except at the discretion of the executive officer.

The conditions were closely lived up to, and during the day not a single growl was heard. The result was a grand victory for the second infantry, the three leading teams being from that organization, the leading team scoring beating the record of last year four points, while its second team also went one point above that record. The line officers' match was also scooped by the second, Lieuts. Edgell and McDonald taking respectively first and second prizes in that match. The first prize in the soldier's match was won by Gibbs of Co. E, 1st regt. The improvement prize, given to the company team that improves its score the most of the record made by it the previous year, was won by Co. K of the 6th infantry. In the staff match Maj. Hinman and Lieut. Merritt were the winners. Co. G, 5th infantry, took fourth prize in the company match, and Capt. Coun of that regiment won third prize in the officers' match. The cavalry match was won by Co. F, cavalry, on a score of 163. Second and third prizes in the soldiers' match was won by Private Dalton, B, 2d cadets, and F. H. Bull, G, 2d infantry. The prizes for the best scores in each organization, after the first three winners, were won by A. A. Hills, signal corps, 1st brigade; H. S. Dewey, Co. C, 1st cadets; Corp. J. F. Barrett, M, 6th regt.; Private F. White, F, 2d regt.; Sergt. Bacheller, H, 8th regt.; Sergt. Battles, I, 1st regt.; Sergt. Darmody, D, 5th regt.; Private C. Frost, F, 9th regt.; Sergt. Shaw, F, cavalry. The 2d brigade staff won the staff team match, on exactly the same number of points (139) as was made in 1886 by the staff of the 1st brigade. The scores in the various matches are appended:

BOSTON, Oct. 8.—The fall meeting of the Massachusetts Rifle Association came to a close to-night, and the shooters separated after having three days of pleasant competition in the various matches. The meeting in a pecuniary sense has not been so successful as in other matches of this kind, but the standard of the shooting has been very high. It was unfortunate that the State shoot came on the first day of the meeting, as it took many away that otherwise would have attended Walnut Hill, and the 500yds. Carton match would not have been a failure. As it was the prizes went begging, as the scores will testify, only that of Edes being of any merit, except to fill in the gap between the first and fourth places. Following are the positions taken in the prizes lists:

Decimal Off-hand Match, 200yds.

E R Foster	67 64 64 64 64—323	C A Joslin	57 57 56 55 55—280

LEOMINSTER, Mass., Oct. 6.—At the recent field day and dedication of the new house of the Leominster Rifle Club many friends were present and entertained in a very hospitable manner. The weather was the only drawback and good scores were almost impossible.

Visitors' Match.

H Rockwell	63655—25	A W Allen	23421—12
F J Whitney	44474—23	C W Burbank	00174—12
G H Cook	42247—19	D Garland	10107— 9
J W Wetherby	03315—18	C G Brown	12302— 8
W A Putnam	52352—17	C L Joslin	20021— 5
J C Chapin	52215—16	C Kenney	01012— 4
W F Stiles	60711—15	C A Hunt	00010— 1
W F Lawrence	21133—15	G F Morse	00000— 0
T H Bates	00232—13		

The silver cup went to Henry Rockwell, a revolver to F. J. Whitney and the leather medal to Geo. F. Morse.

Visitors and members then divided into two teams, and had a friendly match with the following results:

Team No. 1.

WILMINGTON, Del., Oct. 4.—The weekly shooting of the Wilmington Rifle Club took place at Schuetzen Park this afternoon. The event of the day was the badge match, which was won by C. Heinel, Sr., on a remarkable line score, and far the highest by which the monthly badge has yet been won. This makes the third time the badge has been won by Mr. Heinel, and the second time in succession. The scores are as follows on standard targets, at 200yds. out of 100 point:

First Match. Record.

C Heinel, Sr	7	4	6	9	10	9	7	8	8	6—74
S J Newman	4	10	10	8	9	6	6	6	10	5—74
J E Newman	4	4	7	10	7	6	4	6	7	7—62
H B Seeds	9	6	6	3	6	7	4	7	4	7—59
J F Gibson	3	8	3	3	5	8	3	4	5	7—49
W A Bacon	7	5	4	3	4	3	4	4	9	4—45

Second Match. Badge.

C Heinel, Sr	8	10	10	9	6	6	8	5	10	9—81
S J Newman	3	6	6	3	5	7	9	8	5	9—66
H B Seeds	6	3	9	3	7	5	5	7	10	6—66
J E Newman	5	5	5	5	8	4	9	5	9	8—63
W A Bacon	5	4	3	6	5	7	6	6	3	5—50

Third Match. Record.

H B Seeds	8	8	6	9	2	6	7	10	8	7—73
C Heinel, Sr	7	9	5	10	7	8	4	7	6	9—72
J E Newman	5	4	7	9	6	4	8	9	6	6—64
S J Newman	6	8	7	3	8	4	7	6	8	7—64
W A Bacon	3	5	4	3	7	7	5	7	9	7—62

MANCHESTER, Oct. 1.—The following scores were shot at the Manchester rifle range this afternoon:

A B Dodge	9	7	9	10	9	9	9	7	10	7—86
J B Anthony	10	7	9	7	10	10	8	9	7	6—8
J L Niven	9	7	6	5	4	9	7	7	9	7—7
C W Lyman	6	5	5	6	9	6	9	8	5	5—6

HARTFORD, Oct. 4.—The postponed 24 regiment rifle match for teams of the field and staff, companies F, H and K, took place at the range to-day, and company K again captured the medal. The day was rather bright for good shooting, but some was done nevertheless. After the team match pool shooting and for bulls-eyes began and lasted all the afternoon. The full score of the rifle match is appended:

Field and Staff.				Company K.	
	200	500		200	500

Lefever	111111 11 10— 9	Wagner	011111 01 01— 7
E Taylor	011111 10 11— 8		

Ties on 9: McMurchy 0, Stice 2, Eager 2, Lefever 1, Force won with 4. Ties on 8: Budd 1, Riggott 2, Yerrington 2, Manitz 1, E. Taylor and Sheldon 5 and divided. Ties on 7: S. G. Smith 2, Wagner 2, Brientnall 5 and won.

This ended the shooting at inanimate targets. It was the first tournament of the Middlesex Club at which they were used and the result was most satisfactory. The programme drew a large number of the best shots at these targets, and many thousands of them were flown. Some remarkably good scores were made, particularly among the amateurs, two shooters, E. W. Yerrington, of Norwich, and E. Miller, dividing the merchandise prizes in both the amateur and expert classes. A. R. Bowdish, of Oxford, Mass., made the highest average in amateur class, 47, and won a 10-gauge Clabrough gun.

R. H. Brientnall and Dan Lefever, each with average of 44, divided the second prize, a silver mounted split bamboo fly-rod, 1 Peoria blackbird trap and 250 birds, 6½lbs. Dupont's eagle ducking powder and 100 Chamberlin cartridges.

E. Miller and E. W. Yerrington, each with average of 43, divided the third prize, 100 Eley's shells, 100 Chamberlin cartridges and 6½lbs. Dupont's chokebore powder.

In the expert class, C. Wagner, with an average of 47, won the first prize, a M. H. & Co target revolver, with 100 cartridges, 6½lbs. Dupont's powder and 100 Chamberlin cartridges.

R. E. Sheldon, H. W. Eager and H. McMurchy, each with an average of 46, divided the second prize, a Spalding horse hide hunting coat, 1 American clay-bird trap and 200 birds, and 100 Chamberlin cartridges.

J. R. Stice, E. Miller, E. W. Yerrington and C. W. Budd, each with an average of 45, divided the third prize, 1 target pistol, 2 6½lb. kegs Dupont's powder and 100 Chamberlin cartridges.

Thursday, Oct. 6.—The first day at live birds drew many of the old pigeon shots. Among them were Dr. Smith, Lafayette, Ind.; J. Van Brackle and Jas. Lamberton, Mattawan, N. J.; Frank Class, Pine Brook, N. J.; W. Graham, of England; Hugh Leddy, Montclair, N. J.; W. Lever, Elizabeth, N. J.; Frank Creeley, Somerville, N. J.; C. R. Heddon, Newark, N. J.; Joe Camp, Lawrence Station, N. J.; Jack Brewer, F. Kleinz, Geo. Heft and H. Harris, Philadelphia, Pa.; Miles Johnson, Robinsville, Pa.; M. F. Lindsley, Hoboken, N. J.; E. Thompson, Jr. and J. Thompson, of Yonkers, N. Y.; Frank Harrison, Newark, N. J.; L. B. Campbell, Little Silver, N. J.; Geo. Givens, F. M. Fine and W. S. Lawall, of Easton, Pa.; Wm. Hughes, Jersey City, and many others.

Capt. Thos. A. Peacock, of Westfield, N. Y., who goes in every shoot and holds a position with the best of them, was accompanied by his accomplished wife, who was a daily attendant. She is the pet of the Western shooters, and attends all the principal shoots of the country. The Captain and his wife are proverbial for their hospitality, which they are able to indulge to an unlimited extent. The Captain distinguished himself on Saturday by an unbroken run of 95 birds killed.

The shooting was good, but rather slow, and only one regular event was shot, with a few extra sweepstakes at live birds and blue rocks.

Regular event No. 15, at 7 live birds, tournament rules, entrance $5 and the birds, handicap rise, open to all:

McMurchy (31)	1111111—7	Lever (30)	1212121—7
Sheldon (30)	0011221—5	Jones (29)	1112111—7

Budd and Peacock divided. Ties on 24: Kleinz 5, Stice 3, Stewart 2; McMurchy, J. Thompson, Brewer, Cooper and Quinlan, 6 each and divided. Ties on 23 and 22 divided.

Saturday, Oct. 8.—So much time had been occupied with the live birds that it was necessary for some of the advertised events to be left out, and events 19, 20 and 22 shared that fate, only those matches on the scores of which the merchandise prizes depended were shot out. The ties of match No. 19 were shot off in the morning and then events 21 and 23, originally at 7 birds each, were consolidated into one at 10 birds.

Regular events 21 and 23 shot in one at 10 live birds, entrance $10 and the birds, score to count on merchandise, open to all:

Peacock (30yds)	2111121122—10	Dr Smith (27)	1111122110— 9
Budd (29)	1222111112—10	Lever (30)	1211112111—10
Stice (29)	1210122111— 9	Heft (28)	1201120110— 7
Cooper (30)	0211211111— 9	Seigler (30)	1120111110— 8
Kleinz (31)	1101111110— 8	Force (29)	1212012111— 9

Teiple (31)	2112022221— 9	Creeley (30)	1110122211— 9
Brewer (22)	2221111122—10	Quinlan (30)	1112201121— 9
Class (29)	1021212121— 9	Manitz (28)	1111102101— 8
Miller (30)	1112221121—10	D Terry (28)	1211121210— 9
Jones (30)	1211112111—10	M Williams (28)	1111111111—10
Camp (30)	1122111011— 9		

Ties on 10, 8 and 7 divided. Ties on 9 shot off and divided by Stice, McMurchy, Cooper and Smith.

Regular event No. 24, miss and out, single live birds, entrance $2 and the birds, open to all. There were 12 entries for this match, which was shot down to 13 birds and divided by Brewer and Smith.

The merchandise prizes offered on live birds were won, first, a 10-gauge Parker gun and 6½lbs. Dupont's powder, by E. D. Miller and Capt. T. A. Peacock, each with a score of 27 birds straight.

Second prize, a Quimby corduroy suit, to order, 6½lbs. Dupont's powder, and 100 Chamberlin cartridges went to F. W. Cooper, with 26 out of 27.

Third prize, 250 cigars, 6½lbs. Dupont's powder, and 100 Chamberlin cartridges were divided by H. McMurchy, Frank Kleinz and T. J. Ely, with 25 each out of 27.

At 4 o'clock a match between C. W. Budd, of DesMoines, Ia., and Monroe C. Smith, of Syracuse, N. Y., was shot for the championship of the United States and the diamond badge, held by C. W. Budd. The match was at 50 birds each, Hurlingham rules:

C W Budd	1102121111111112111112111211211211211111—48
M C Smith	0110110111112111111211111111111102111012111221—45

Budd killed 8 straight drivers, 1 right driver, 23 right quarterers, 6 left quarterers, 7 incomers, 2 towerers and 1 hoverer; missed 1 straight driver and 1 towerer; used second barrel 10 times; dead out of bounds, 0.

Smith killed 8 straight drivers, 3 right drivers, 2 left drivers, 14 right quarterers, 9 left quarterers, 7 incomers, 1 towerer and 1 hoverer; missed 1 straight driver, 1 left quarterer and 3 incomers; used second barrel 7 times; dead out of bounds, 1, the 39th bird.

Budd thus retains the championship and the diamond badge, which now becomes his property, as the time for which it could be challenged expired by limitation Sept. 28.

This ended one of the most successful tournaments held in this country, or in any other, in the opinion of many old shooters present. The arrangements were most complete at blue rocks, three sets of traps were in motion almost constantly and the regular events and extra sweeps were rattled off at a lively pace. This meant hard work for the tournament committee, W. Fred. Quinby, Chas. Richards and T. H. Keller, but they went at it with a will and everything ran along smoothly and without any hitch.

The Middlesex Club is a live and wide-awake organization. Their grounds are handy to New York and are very complete in their appointments, including a good club house, grand stand, and last but not least, quiet and commodious quarters for the press. May they always have as good success in their ventures as in this one. Biz.

At the Dunellen tournament last week, two matches were made, one between C. W. Budd, of Des Moines, Iowa, who holds the championship diamond badge, and Jack Brewer, of Philadelphia, Pa., for $250 a side at 100 birds, London Gun Club rules, to be shot at the grounds of the Middlesex Gun Club at Dunellen, Oct. 12.

The other match is between Wm. Graham, of England, and Jack Brewer, for $100 a side at 100 birds, Hurlingham rules, to be shot at Merchantsville Driving Park, near Philadelphia, Pa., Oct. 24.

A challenge was also issued by Messrs. Frank Kleinz and Jack Brewer, of Philadelphia, and Wm. Graham. They three, Kleinz with a 10-gauge gun and Brewer and Graham with 12-gauge, offer to shoot any three men in the world using same gauge guns for $300 a side at 50 birds; or $600 a side at 100 birds, Hurlingham rules.

NEW YORK, Oct. 10, 1887.—*Editor Forest and Stream:* With reference to the challenge of Mr. Wm. Graham, in your last issue, I will say that although the time for which the championship badge could be challenged has expired, I am willing to accept any reasonable challenge backed by a forfeit from Mr. Graham.—C. W. Budd.

NEW BEDFORD, Oct. 4.—A match was shot in this city to-day between the New Bedford Gun Club and the Bay Ridge team, of Raynham. Each man shot at 10 clays and 10 blue rocks. The Raynhams were defeated for the second time:

CLEVELAND, Sept. 29.—The day was too dark for good shooting from most of the members of the Cleveland Gun Club who attended the regular shoot of the club to-day. Keys, however, did not seem to mind the darkness and he broke 20 straight birds in fine style. The expert shooting of Keys was matched by Mr. Auld, a visitor at the shoot, who also broke 20 straight birds, and in the team shoot which followed Auld added another run of 10 birds to his remarkable score. First badge, Class A, was won by Keys, and F. Henry won the second badge, Class B.

Club Shoot.

WASHINGTON, D. C., Oct. 4.—An informal shoot was held at the Cosmopolitan Club under the auspices of Mr. Wills at live birds, 3 traps, 21 and 26yds. rise, 80yds. boundary:

First match, second barrel count ½:

Cunningham	1 1 0 1 1—4	Holmead	0½½ 0 1—2
Green	0 0 0 1 1—2	Schroth	1 1 1 1 1—5
Jones	0 1 1 1½—3½	Wagner	½ 1 1 1½—4
Godey	0 0 0½ 1—1½		

Cunningham and Wagner second.

Second match, one barrel:

Green	00111—3	Scannell	00111—3
Cunningham	11011—4	Godey	11101—4
Holmead	10113—3	Schroth	10111—4
Jones	11111—5	Wagner	11111—5

Jones and Wagner first, Cunningham and Schroth second.

Third match, one barrel:

Cunningham	11111—5	Holmead	10011—3
Green	11100—3	Wagner	10101—3
Jones	11111—5	Schroth	01100—2
Godey	01001—2		

Cunningham and Jones first, Holmead and Wagner third.

Miss and out.—Jones 2, Cunningham 5, Godey 1, Bartlett 2, Woodbridge 0, Green 2, Schroth 2, Holmead 4, Wagner 3, Doyle 2, Talbott 0, Simpson 0; Cunningham won.—TIM BERDOODLE.

BROOKLYN, Oct. 5.—Fountain Gun Club.—Borden found the birds, and they were of the best possible description, preventing any large scores. The tie was not shot off, as Lake, having won a first prize, was not eligible to take another; it went to McLaughlin, and Lake took second:

Dr Shields (30)	0111101—5	J Beacham (23)	1100110—4
W Stuart (26)	1011110—5	H Thorpe (25)	1111011—6

J H Sawyer (21)	1011010—4	C Wheeler (21)	0011010—3
R Wells (21)	1111011—6	C Carlos (27)	1011011—5
A Crooke (21)	1110011—5		

Kearney, Cooke and Lange withdrew.

BROWN'S SHOOTING PARK, Long Island, Oct. 8.—The great match for the Livingston Cup, presented to the New York Club, in 1880, by Ellis Livingston, came off to-day and was won after an exciting struggle by Mr. Allan Nichols. Never before were so many Indians on the grounds; fully two score occupied the vine-covered portico of the new club house, with their escorts. The New York clubs were well represented and many famous names were registered on the club's guest book. The weather was perfect. The occasion was one of rare interest to the New York Club, and nearly one hundred gentlemen were present to extend a welcome to their comrade, their "old reliable," just returned from a three months' yachting cruise—Mr. Allan Nichols, who has four times defended successfully the Club cup, the genial traveler and sportsman. To win the match of this morning, heavily handicapped by lack of practice, Mr. Nichols had need of the "nerve reserve" that has made his name familiar to lovers of sport throughout the world, for, be it known, he has shot game, large or small, in every country on the globe. Opposed to Mr. Nichols was the crack shot of the Huntingham Club, of London, the great hunting man and well-known artist, "Lightning Harry" Trevor, whose face is familiar to many American sportsmen. Gordon Gordon was selected as referee. The birds were furnished by Capt. Brown and were strong and swift. The conditions of the match were: Fifty birds each, 30yds. rise, 80yds. boundary, both barrels. Both gentlemen shot with hammerless Scott guns (7lbs. 10oz.) and used 4drs. powder, 1¼ shot. (The figure 2 indicates second barrel.)

Mr Nichols.....1111111111112*12111111111201111111211201111121111—48
Mr Trevor.....1211111111122*2210011111111122220011111212111122—45

SAN FRANCISCO, Oct. 1.—The shooting season was brought to an end this afternoon at Adams' Point by the members of the Blue Rock Club. Being the final shoot, a much larger number of marksmen were in attendance than at any of the previous club gatherings. W. J. Fox won the first prize, a Winchester rifle, having the highest average during the year. Second prize, a gun case, won by Charles D. Laing. Third prize won by S. T. Kellogg. Fourth prize, 200 shells, won by W. G. Crandall. Following is the score of to-days' shoot, 20 birds each: Kellogg 12, Golcher 11, Laing 14, Tubbs 12, Crandall 9, Kellogg 13, Leviston 5, Golcher 9, Beaver 5, Kellogg 14, Crandall 3, Fox 16, Abbott 8, Harris 12, Putzman 6.

CANTON, O., Sept. 26.—The third in the series of three matches between the Canton and Kent gun clubs was shot on the grounds of the former here this afternoon, with teams of 12 men on each side, 25 single birds. Canton won with 186 to Kent's 169.

DRIFTING.

IN a quiet way we of the Y. C. C. have been having a very enjoyable summer in our boats. While the warmth of spring was still grateful, and its fresh green verdure still a novelty, we were smitten most by the charms of Nature. So Saturday afternoons found us, with camp kit packed, drifting for the lonely Jersey shore under the Palisades at the enticing spot called Egg Beach. There, leisurely and undisturbed, we cooked the simple, frugal repast of a canoeist (usually eggs, bacon, toast and coffee), smoked a quiet pipe, and when the mosquitoes insisted upon it, left. Then a lazy drift home with the tide, for we of the Y. C. C. were then a philosophic set, never paddled when we could avoid it, and always arranged to have the tide with us. Aye, verily, in those days we loved best to imitate the peaceful calm of the good old Dutchmen whose drowsy influence still lingers along the Jersey coast hereabouts.

But some Yankee skippers up river a bit held what they called a "meet." Inasmuch as the tide was that way we naturally thought it mete for us to be there, so thoughtlessly drifted up. There we found them trying to see which boat could go the fastest. It seemed a most absurd idea, but we were off for a lark, so took a hand. There's no tide in Sing Sing Bay, however, and we couldn't get any headway on.

But we got bees in our bonnet, nevertheless. The treasury, for which we hitherto had had no use, was scooped dry to buy medals; and thereafter Saturday afternoon found the Y. C. C. sailing and paddling around two or three red tin cans, like a dog chasing its tail. True, some of us more conservative members occasionally sighed for a drifting match, but we were quickly silenced by the young and progressive members (especially that wild young Irishman Patsy, who sails every race in his bathing suit and is always glad of it). But still we put our heads together and concocted a cunning plan. We managed to prohibit the use of centerboards; and as we still, from force of habit, calculated the tide, we who didn't like racing enjoyed the drifting part immensely. Some said the prohibition was because there was only one boat that had a board, but we who fixed it know better. At any rate it takes away the main objection to this racing business—the speed.

On Labor Day, thinking we ought to do some work, we decided to take a drift up river, as the tide was up. So in the morning a fleet of nine red dolphins, with sails spread to dry, was slowly drifting up stream. It was like old times: but *die schrecklichen Kuaben* wanted to race again, so they calculated the tide, and drifting on the Jersey side where the tide runs fastest beat us all up.

But on and on we drifted, past Greystone, Hastings, past the Jersey line into the Tappan Zee, past the rusty little hamlet of Rockland (*Mein Freund*, if you ever go to Rockland and sit down on the ghostly timbers of the old sloop on the beach, you'll fall asleep in five minutes), but the tide turned then and we had to go home—home, the sometime dwelling place of Yoncker Phillipse.

YONKERS.

A. C. A. EXECUTIVE COMMITTEE MEETING.

THE below named gentlemen are hereby appointed Regatta Committee for the ensuing year and will be respected and obeyed as such: Chairman, C. B. Vaux, New York; Paul Butler, Lowell, Mass.; W. A. Leys, Toronto, Canada. And the below named are hereby appointed Committee on Camp Site and Arrangements: Macomb G. Foster, New York; C. M. Shedd, Springfield, Mass. These gentlemen will add to the committee a member of the Northern Division. The committee will meet at the Delavan House, Albany, Nov. 12, at 10:30 A. M. The Executive Committee will receive reports of the other committees at 11 A. M., or as may be arranged. The Mohican Club extends a cordial invitation to all members of the A. C. A. on that day and the following.

ROBERT W. GIBSON, Com. Elect.

ALBANY, Oct. 6, 1887.

NEW YORK C. C. FALL REGATTA, OCT. 8.

THE best and most successful canoe race ever sailed on New York Bay was that of Saturday last, the race for the sailing trophy of the New York C. C., lately illustrated in the FOREST AND STREAM. The conditions were unusually favorable, a strong wind up the Narrows and an ebb tide, thus giving the benefit of the tide on the windward work, while the fleet of 13 canoes was a representative one, including Pecowsic, Rat, Minx, Sunbeam and Essex, each with at least a local reputation. The first event of the day was a sailing race for unclassified boats, over the same course as the canoe race, but only one round, 4 miles, starting at 2:21. The times were:

	Finish.	Elapsed.
Tern, H. R. Averill, Brooklyn	3 07 45	46 45
Vixen, J. Johnson, Brooklyn	3 13 25	51 25
Terrapin, J. B. Fosdick, New York	3 16 00	55 00
Coquette, M. V. Woodworth, New York		Withdrew.

Tern is a Jersey beach boat, 38x5ft., with balance lug, Coquette an open rowboat, Vixen a Barnegat cruiser, and Terrapin a sneak-box.

The race for Classes A and B together was started at 2:45:30, by which time a strong wind was blowing up the Bay. The course was as in the international races of last year, from club house to a buoy in midchannel, thence to buoy near Staten Island shore at Clifton, and home, the first leg being to windward, the second a close reach, and the third free, two rounds, 8 miles in all. The times were:

	1st Round.	Finish.
Pecowsic, Geo. H. Barney, Springfield	3 20 45	4 11 30
Essex, Geo. W. Cox, Essex	3 33 50	4 12 20
Rat, Grant Edgar, Jr., Newburg	3 33 00	4 12 30
Latona, Wm. Whitlock, Brooklyn	3 32 30	4 13 10
Sunbeam, H. E. Ward, Brooklyn	3 35 26	4 13 45
Atalanta, L. B. Palmer, Ianthe	3 37 05	4 20 20
Nile, W. Burling, Ianthe		4 20 50
Traup, C. J. Stevens, New York	3 36 50	4 22 10
Puritan, Clarence Eagle, New York	3 39 12	4 23 30
Idlemere, J. L. Douglas, Ianthe	3 38 00	Not timed.
Natchez, E. H. Platt, New York	3 39 05	Not timed.
Minx, M. V. Brokaw, Brooklyn	3 35 20	Withdrew.
Sea Urchin, B. H. Nadal, New York		Withdrew.

The elapsed time of the leaders was: Pecowsic 1.26.00, Essex 1.26.50, Rat 1.27.00. Minx and Sea Urchin, overrating the force of the wind, started with small sails and were unable to keep up. Pecowsic carried two sails of her well-known rig, and sailed as fast as usual.

In the tandem canoe race the starters were:

Minx, Blake and Brokaw, Brooklyn	1
Atalanta, Palmer and Burling, Ianthe	2
Lassie, Rice and Nickerson, Springfield	3

The race was a close one, Atalanta leading nearly to the finish, when Minx by a hard spurt won by 2ft.

The last race, paddling, single, Classes III. and IV., brought out but three starters:

Pecowsic, H. E. Rice, Springfield	1
Atalanta, L. B. Palmer, Ianthe	2
Hermit, W. P. Stephens, New York	3

The course had two turns at right angles, which hindered the long, narrow Pecowsic somewhat, as she used no rudder, but on the straight courses out and in she ran away from both the wider boats, winning by three lengths from Atalanta, with Hermit last. A large number of spectators were present, while quite a party of canoeists camped in the club house over night, sailing for home next day. The prizes, besides the cup, were silk flags. Through the kindness of the Corinthian Y. C., the guests of the N. Y. C. C. were enabled to view the races from the balcony of the C. Y. C. house.

PITTSBURGH C. C. FALL RACES, OCT. 5-8.

THE Pittsburgh C. C. held two sailing races to wind up the season on Oct. 5 and 8, the first being unlimited, and the second a handicap based upon the result of the former. The course was on the Alleghony between bridges—about ½ mile and return, the number of rounds to depend on the weather. As many of the canoes are still at Conemaugh Lake, several of the craft entered were sailed by members other than their owners; in some instances by men who had never been in them before. Wednesday was a cold, blustering day, with a strong N.W. wind coming in puffs and a feeling of snow in the air. Close reefs were the order of the day, and owing to the discomforts of the cold wind and flying spray it was decided to sail one round only, a half mile to windward and return. The starters were G. H. Singer, Marguerite; J. K. Bakewell (the attorney for the defense), Lorna; W. W. Lawrence, Edith Adele; C. F. Holdship, Amaryllis; A. K. Nimick, Nirvana "B", and W. N. Murray, in the old Nirvana "A" of 1885 fame. A very fair start was made with all on starboard tack except Lorna, who was caught on the wrong tack and compelled to pass astern of the other five. She was caught again on her return by a passing towboat, so that her real start was almost three minutes behind the rest; and as her gear was out of order and an experimental false keel hindered her handling she retired a little later. Meanwhile the others were stretching over toward the Pittsburgh shore, Marguerite, to leeward at the start, was first to come about, and after a short leg to starboard was forced around again by the same towboat that discomfitted Lorna. She was doing well in the choppy water (she was designed for New York Bay) and on next stretch managed to cross the bow of Amaryllis by a very scant margin; but when she reached Edith Adele she could not quite make it, and as the skipper of that craft was too busy watching the puffs to look under his boom, the result was a pretty smart bump; Marguerite catching the other's stem on her lee bow, abreast of the mast. This of course ruled out the port tack boat, but she kept on to the end of the race for the fun of the thing. The two Nirvanas were having a private fight all little time, in which the smaller, with a new brass blade in place of her former Atwood board, was steadily gaining; the new one being probably too strange to her owner to do her best to windward. The little Class A canoe went on, gaining on every tack, until the bridge was reached, when to avoid a gibe she turned the pier the wrong way, and ended her chances of winning, though she finished first. Marguerite worked into second place near the bridge, but being compelled to make a short tack to weather the pier lost it again, and turned just astern of Nirvana B. Once before the wind, which was falling a little, both shook out reefs, in which operation Marguerite lost her main sheet overboard, and was obliged to come around head to wind to recover it, which decided the contest for first and second place. The other two contestants were having a most interesting race between themselves, Amaryllis beating on the wind, but losing her advantage by tacking in place of gibing at the pier, and Edith Adele managed to beat her out by just 10 seconds at the finish. The elapsed times were as follows: Nirvana A, 22m, 15s.; Nirvana B, 23m. 25s.; Marguerite, 25m. 15s.; Edith Adele, 28m. 20s., and Amaryllis, 28m. 30s.

The day for the handicap race was very different; warm and pleasant, with so little wind that it seemed like folly to attempt to sail over the course, and both Marguerite and Nirvana A declined to start. In addition to the entries of Wednesday, Eurylda, W. E. Woodwell, and Notus, R. W. Bailey, appeared and were started at scratch, the handicap being arranged after the fashion of a sprint race for the sake of novelty, and as this was to be twice over the course, the allowances were double the intervals between finishes in the former race. Thus Amaryllis and Lorna were first sent off together, then Edith Adele 20s. later, then Nirvana B 9m. 50s. later, and after 2m. 20s. more, the scratch canoes. As a matter of fact, however, the calm completely spoiled the allowances, for Eurylda, favored with a slant, got actually a better start than Nirvana; and the first starters were less than 200yds. away when the last crossed the line. Then the wind went round to east, making a reaching race of it, and blew in very mild streaks and puffs. Notus seemed most favored by these, and after starting at scratch, and last to cross the line, slipped through Lorna's lee just at the bridge, and was first to make the turn. Nirvana also managed to work through the doldrums at the bridge, and get away on the return just ahead of Lorna, while Edith Adele next drifted under the lee of a pier and was completely becalmed while all the rest passed and got well away for home. The wind headed off Nirvana and Lorna, and drove them clear over to the Alleghony shore, and then came back and gave Eurylda a lift that brought her close up to Notus's stern before that craft got it at all. The leaders carried this puff up to and around the home stake, and Notus was well started by it on her second round; but then it failed her, and both Eurylda and Nirvana, the latter once more in second place, almost overtook her at the lower turn. In fact, all three were under the bridge at the same time, but Eurylda was on the wrong side of the pier, and before she could work around it, Notus had picked up a breath, and drew away, finally finishing first in 1h. 2m. elapsed time, for a race of two miles only, with no windward work. Nirvana finished 30s. behind, and Eurylda third by about same amount. Lorna and Amaryllis sailed almost a dead heat, and Edith Adele, after her sad experience on first round, did not attempt a second.

Woodwell promptly challenged "Nervy Anna" as he called her, to sail a match on Oct. 12, and both agreed to let in Notus on an allowance of 5m. per round. Then the regatta committee rose up in their might, and announced that, as the weather had prevented a satisfactory race, the whole thing would have to be sailed over on the 12th, so weather permitting, the fun of the season is not yet ended.

BRITISH CANOES OF 1887.

THE collection of canoes of the first British canoe meet, though small in point of numbers, was most interesting as an index of the coming types of canoes in British waters, especially so when the influence of the international matches of last year are considered. For the past ten years, while there have been canoes of all types in use, the representative British canoe has been the Thames racing craft, the wide and heavy boats like Pearl and Nautilus. Other types have existed, the small hack paddling canoe, the long and narrow canoes of the Humber, the keel canoes of the Clyde, but the racing has been confined mainly to a few heavy canoes built under the R. C. C. rules. That they could not hold their own in point of speed with the smaller and lighter American craft was clearly proved last year, and as might be expected, the new boats have been largely modified in accordance with American ideas. The deck sitting pounder, smaller and lighter hull, finer lines, and an abandonment of much of the ballast are the main points in which the influence of American ideas are shown. From the following description of the canoes at the meet, taken from the *Field*, it will be seen that two widely different classes of canoes are coming to the front, and that the comparatively small but heavy lead ballasted canoes of the R. C. C., with large and complicated rigs, are likely to give place, as far as general canoeing goes, to boats more like the American craft, while in addition a class of larger boats, the so-called "canoe yawl," is rapidly springing up. These boats are from 16×4ft. to 20×5½ft., the larger boasting quite a cabin, and capable of really serious work in open water. There is plenty of room for such boats in America, and while they can never supersede the canoe proper, they are well suited to the wants of many who have outgrown canoeing and wish a larger craft, or who are located on waters too open and exposed for safe and comfortable work in a small canoe. The *Field* says:

Every variety of canoe and canoe-built boat was represented at the meet on the Norfolk Broads, and a comparison of their merits and demerits was a point of interest.

The Charm naturally claims attention first, because she is the representative of the last development of canoeing, and because, in point of speed, she surpassed every canoe at the meet, whether large or small. She is 15ft. 4in. by 2ft. 6in., with 10in. moulded depth amidships. Within these dimensions it is certainly possible to build a very wholesome cruiser, but this, the Charm, certainly did not prove herself to be. Her bow is very long and sharp, with very little flare aloft, and she has very little round in her deck, so that she has nothing like the stowage accommodations that might be provided within her dimensions. There can be no manner of doubt that her under-water shape is very nearly perfection—the nearest to perfection that has hitherto been attained—for speed through the water, and, although she has considerable dead rise in her floor, the turn of her bilges is so sharp that she has very nearly her full beam at the waterline and a midship section that gives her great stability. If she had more sheer, more freeboard, or more round to her deck, she would then be capable of carrying a reasonable amount of stores and equipment, whereas she now can carry only a small proportion of her owner's outfit. Her lug mainsail was as good, if not better, than any other sail at the meet. A comparatively short mast, with long boom and high peak, made a very effective and driving sail. She had reefs fitted with "Pearl" gear. She is certainly well handled by her owner, who seems to be able to make her do anything but talk and carry stores.

The Mac, belonging to Mr. W. G. McKendrick, of the Toronto Canoe Club, arrived just after the commencement of the cruise, too late to compete in the races; but she is certainly a very fast boat, and an example of the influence Pecowsic is having on canoeing in Canada and America. She has the same fine lines and rising floor as Charm, and is even less steady to set, but having plenty of sheer and freeboard, she was able to carry her owner's tent and camping outfit. Her length and beam are about the same as Charm's, and she is rigged with high peaked sails that are entirely abaft the masts. A specially noticeable feature in her outfit was a tin box shaped to the boat, that was carried amidships, and served both as deck seat and store box. In the head of her sail was the red circle, the "totem," or signal of the Toronto Canoe Club. She was roughly built compared with the canoes of Turk's or Bond's workmanship, but her gear was all strong and serviceable. On a reach or a run she is extremely fast; but when it came to a turn to windward in narrow waters, she was not up to the form of either Charm or Daisie, and her owner always preferred paddling under these circumstances. One peculiarity about her was that she was always paddled with the crew sitting on a seat placed across the combing, and with an extra long paddle she traveled in a wonderful way.

The second boat in point of speed was Mr. Livingston's canoe Daisy, built by himself. She is about two feet shorter than Charm, but, having no hollow in her waterlines, and plenty of body above water, she carried easily everything necessary on a trip of this kind, and she is at the same time a handsome, well-built boat, that would take the eye directly it was looked at; all her outfit was strong and suitable, without being heavy. In a heavy blow she went very well under a small mizen set on her mainmast, and looked, as she no doubt was, a most comfortable cruiser. All the Mersey canoes present were good, wholesome cruising canoes. Mr. Williams's Gipsy, 15ft. x3in. (also from the Mersey), is a very different type. She is all boat from end to end, very flat floor, and plenty above water, and, with a boat tent, her owner slept on board, and seemed to be very comfortable. Mr. Madan's Carmen is built from lines of cruising Nautilus, given in "Yacht and Boat Sailing," and she certainly combined to a great extent ease in paddling, with very fair sailing capabilities. This pretty well finishes the list of noticeable second class canoes.

The double canoes, Irene and Buttercup, proved very good cruisers. They are about 17ft. x2ft. 6in., and 11in. moulded depth. They were rather too crowded when carrying the gear and effects of a double crew, but when used as Irene was by Mr. Nisbet alone, there was plenty of room, and the extra length of these boats enabled them to hold their way in lumpy water; they paddled easily, and sailed very well, except when the wind was from before the beam; but even then, under sail and paddle, they would pass the whole fleet. These canoes were always hauled out on the bank at night, and the sleeping arrangements of the Irene were most comfortable, and well deserved the prize awarded in the competition at Teddington last year.

The boats which ran second and third to Charm and Daisy in the regatta at Oulton were of quite a different type. The Brownie and Doris are 16ft. by 4ft. and 17ft. by 4ft. respectively, and have every feature of the Pearl type of canoe, but with extra beam. These large canoes are likely to become popular; they are as easy to sail as a Pearl, and, propelled by sculls, will go as fast as the smaller canoe under paddle—their disadvantage being that they are too heavy to be hauled about and handled on shore like their smaller prototypes: but their larger size makes them the better suited for being slept in lying afloat. These boats will sleep two on board, and carry with the greatest ease all the luggage and stores for two on such a trip, and during the day two can sail on board very well. The Doris and Brownie have hatchways 6ft. long and 2ft. broad, and the hatches, which are hinged in breadths of about 18in., in two sets, stow under deck when not in use. In the well are two boxes, each 2ft. by 12in. wide and 12in. deep, the lids fitting over with very deep coamings, so that no water can get in, and these serve as seats at fore end and aft end of well, one making a steering seat, the other a rowing thwart, and carry the bedding and other dry stores. Their masts lower, a great advantage where bridges have to be encountered. These boats will go

through a great deal of "weather," as proved by the Brownie having been sailed round from the Thames, and on the passage she ran from Harwich to Lowestoft under eight hours. Their draft of water is only 9in. with centerboards up, with all stores on board. Either can be hauled about on shore by two men; that is their ordinary crew, and, therefore, they are at no disadvantage on such a cruise compared with the smaller boats, the Doris having been hauled over the Dyke and taken up the Muck Fleet by her crew without assistance when prospecting camp sites for the cruise.

The Cassy has already been described in *The Field*, and her lines appear in "Yacht and Boat Sailing." She was at the cruise with others of the same build. The disadvantage of this type is that it is not large enough to carry two men with stores, etc., while it is large enough and heavy enough to be more awkward, in fact, impossible for one to haul about except on wheels. It is a half-way stage between Pearl and Brownie, or Doris, like the goose, "an awkward bird, too much for one, and not enough for two." Of course this was written with special reference to the cruise that has just taken place, and without any desire to disparage the good qualities of the Cassy, which make her so suitable for the use to which she was designed, single-handed sailing on the Humber and the neighboring coasts, where something larger than an ordinary canoe of R.C.C. dimensions is necessary for comfort and safety. Sabrina and Muriel are very much alike. Two powerful boats, about 15ft. long, and a little over 3ft. beam. Sabina was built for Dr. Paul this spring, by Bond, and is about as large a boat as one hand can put afloat or haul up at the M.C.C. slip, and the proof of their sea-going quality is, that after the meet they sailed round to the Thames.

Of the eight Mersey boats present, seven were new this year, and six of them were built by Bond.

Of the second class canoes that went the cruise, Mr. Cox's Lita, 14ft.×33in., built by Bond, is a very good example of what can be made of an R. C. C. cruiser. She has her faults, no doubt, but want of pace is not one of them. She did her work well, and was sailed all through the bad weather, when a good many other boats took to the paddle and towline. She has a little too much rise of floor for most people, but carries her lead well, and always seemed to sail better with her duffle on board.

Any account of boats at the meet would not be complete without a mention of Mr. Scott's old cruiser Jacare. Not by any means a handsome boat, and with no centerboard, she paddled extremely well, and was nearly always first in camp. Where her owner managed to stow everything that came out of her was surprising, and as far as having everything necessary on board was concerned she was certainly a marvel.

There were some Humber yawls, notably one belonging to Mr. Holmes, and one to Mr. Jacobs, which exceeded in size any of the boats already mentioned, being about 19ft.×6ft., fine, able boats that would live through very rough water. These boats had no centerboards, and only about 6in. of keel, their draft being about 15in., and the rig being the canoe battened balance lug mainsail with sprit mizzen. They could carry a crew of four with ease, and were very comfortable boats to cruise and camp in, but, of course, they could not be hauled about and taken up the shallow waters of the Muck Fleet like the smaller boats.

OAKLAND C. C.—On Sept. 25 the Corinthian Y. C. gave a reception at their club house, Point Tiburon, to the Oakland C. C. Early in the morning thirteen of the club canoes were taken in tow by a tug and proceeded to Point Tiburon, where a race was arranged for a silk pennant offered by the Corinthian Y. C. The course was triangular, two rounds, making three miles. Ten canoes started, the finish being timed Bonita, 12:53:32; Gipsy, 12:55:15; Alista, 12:56; Mystic, 12:56:30; Flirt, 12:57; Zoe Mou, 12:59. After the race a dinner was served at the club house, followed by a sail in the yachts of the club, Spray, Ripple, Freda, Thetis, Pilgrim and Windward. At 5 P. M. the tug started home with the fleet, only Bonita going back under sail.

BUILDING NOTES.—Mr. H. M. Sprague, whose boat shop at Parrishville, N. Y. was burned out entirely last August, has erected a two story building, 50x22ft. on the old site, and is better equipped for work than before the fire.

Yachting.

THE REVISION OF THE DEED OF GIFT.

IN commenting last week on the deed of gift and its interpretation, we touched on the desirability of permanence in such a document, and suggested that any needed improvements might be made by such action of the club as would establish a precedent without recourse to anything so radical as a second alteration of the deed of gift itself. While the article in question was in type the New York Y. C. held a meeting, at which a committee was appointed for the purpose of amending the deed of gift in co-operation with Mr. Geo. L. Schuyler; so that the entire question may be considered as open for argument, pending a decision which we hope may be both satisfactory and final. It is a most difficult matter for any body of men, however well informed, to frame conditions which shall be permanent and binding, and yet which will stand the test of time and of the constant change and improvements that are found everywhere. The vital importance of protecting such a trust as the Cup from any unauthorized tinkering, or even from too frequent changes, good as well as bad, is too plainly evident to need proof; but at the same time yachting is constantly changing, boats, methods and rules must improve with time, and some provision must be made for the natural process of growth. To meet these two conditions, then, but one plan is possible; the deed of gift must be framed broadly and must be based only on the general principles of fair play which govern all sports, while as to the minor details they must be left largely to an interpretation of the general specifications in a liberal and sportsman-like spirit, and to the establishment of such precedents as will insure an adherence to these principles on the part of all to whom the temporary guardianship of the Cup may fall.

The history of the deed of gift is briefly as follow: After remaining in the hands of the original owners of the America from the time it was won in 1851 until 1857, the Royal Yacht Squadron Cup was presented to the New York Y. C. in the latter year, with the following conditions attached:

"Any organized yacht club of any foreign country shall always be entitled, through any one or more of its members, to claim the right of sailing a match for this Cup with any yacht or other vessel of not less than thirty or more than three hundred tons, measured by the Custom House rule of the country to which the vessel belongs.

"The parties desiring to sail for the Cup may make any match with the yacht club in possession of the same that may be determined upon by mutual consent; but in case of disagreement as to terms, the match shall be sailed over the usual course for the annual regatta of the yacht club in possession of the Cup, and subject to its rules and sailing regulations—the challenging party being bound to give six mouths' notice in writing, fixing the day they wish to start. This notice to embrace the length, Custom House measurement, rig and name of the vessel.

"It is to be distinctly understood that the Cup is to be the property of the club, and not of the members thereof, or owners of the vessel winning in a match; and that the condition of keeping it open to be sailed for by yacht clubs of all foreign countries upon the terms above laid down, shall forever attach to it, thus making it perpetually a challenge cup for friendly competition between foreign countries."

The gentlemen who gave the Cup were John C. Stevens, Edwin A. Stevens, Hamilton Wilkes, J. Beekman Finley and George L. Schuyler.

It is a fact generally overlooked that the manner in which the Cup came into the possession of the gentlemen has not, and never had, any bearing on the international races, the Cup was simply their property, no matter whether won by them or purchased for this purpose, and it was dedicated by them to the promotion of international yacht racing. It was originally offered as a prize for an open race and was won by the America from a fleet of fifteen yachts, a comparatively easy task then when the rigs and models of her opponents, as well as the state of yacht racing at the time are taken into account. With the yachts of to-day, however, a large number of boats fairly equal in speed, it would be almost an impossibility for one yacht, however speedy, to win from a dozen or more boats of a different nation, all sailing not to beat each other, but her alone. Were such conditions adhered to all international competition must cease at once as far as the America's Cup is concerned. It sounds well to say that as America won it from a fleet it should be defended, as in 1870, by a fleet, but the fallacy of this reasoning is apparent to every fair-minded sportsman. Further, when America sailed for the Cup every one of her fifteen competitors was also sailing to win it, but when Livonia sailed against twelve yachts at New York every one of the twelve was sailing, not to win the Cup herself, but to prevent the British yacht from winning it, a vastly different matter.

Under the old deed of gift four series of matches were sailed, the last being with a yacht of American type that was towed to New York through the canals on her bilge, being fitted out here. In order to prevent the bringing of a challenger by rail, by canal or by an ocean steamer, and to confine the challenge to seagoing craft, the Cup was returned by the club to Mr. Schuyler, the only survivor of the five donors and by him was again presented to the club with the following new deed of gift:

"Any organized yacht club of a foreign country, incorporated, patented or licensed by the Legislature, admiralty or other executive department, having for its annual regatta an ocean water course on the sea or on an arm of the sea, (or one which combines both), practicable for vessels of 300 tons, shall always be entitled, through one or more of its members, to the right of sailing a match for this Cup, with a yacht or other vessel propelled by sails only, and constructed in the country to which the challenging club belongs, against any one yacht or vessel as aforesaid, constructed in the country of the club holding the Cup.

"The yacht or vessel to be of not less than 30 nor more than 300 tons, measured by the Custom House rule in use by the country of the challenging party.

"The challenging party shall give six months' notice in writing, naming the day for the proposed race, which day shall not be later than seven months from the date of the notice.

"The parties intending to sail for the Cup may, by mutual consent, make any arrangement satisfactory to both as to the date, course, time allowance, number of trials, rules and sailing regulations, and any and all other conditions of the match, in which case also the six months' notice may be waived.

"In case the parties cannot mutually agree upon the terms of a match, then the challenging party shall have the right to contest for the Cup in one trial, sailed over the usual course of the annual regatta of the club holding the Cup, subject to its rules and sailing regulations, the challenged party not being required to name its representative until the time agreed upon for the start.

"Accompanying the six months' notice, there must be a Custom House certificate of measurement, and a statement of the dimensions, rig and name of vessel.

"No vessel which has been defeated in a match for this Cup can be again selected by any club for its representative until after a contest for it by some other vessel has intervened, or until after the expiration of two years from the time such contest has taken place.

"Vessels intending to compete for this Cup must proceed under sail on their own bottoms to the port where the contest is to take place.

"Should the club holding the Cup be for any cause dissolved, the Cup shall be handed over to any club of the same nationality it may select which comes under the foregoing rules.

"It is to be distinctly understood that the Cup is to be the property of the club and not of the owners of the vessel winning it in a match, and that the condition of keeping it open to be sailed for by organized yacht clubs of all foreign countries, upon the terms above laid down, shall forever attach to it, thus making it perpetually a Challenge Cup for friendly competition between foreign countries. "GEORGE L. SCHUYLER."

The principal changes were the limitations to clubs having deep-water courses and to vessels coming under sail only to race; a id while in a general way there is little fault to be found with the conditions here laid down, it is evident that they do not fully cover the ground, and that many loopholes are left for misunderstanding and disagreement, and one such question has come up this year—the waterline length.

To any one who studies the original deed and bears in mind the general practice of yachtsmen and builders thirty years since, it is evident that no reference to waterline length was intended, nor is there any information in the revised deed that a change in this respect was inforred, though not specified. To-day the load waterline is the common standard of comparison among all yachtsmen, whatever their local rules may be, and that only should be required of the challenger, the obsolete tonnage and Custom House measurement clause being dropped entirely.

Another point on which the deed is not explicit is that of more than one challenge at the same time, or the right of one yacht to challenge while a match with another is pending. If a challenge were received now for a match in April, there is nothing in the deed of gift to prohibit a second challenge later for a match in July and a third one in October. The only case of the kind that has yet arisen was that of Galatea's challenge in 1885, when the club agreed to sail her if Genesta failed to win the Cup. As to the desirability of more than one race in a season, it is probable that all future defenders will be fully satisfied with a single match, certainly one each year is enough for the New York Y. C., and we believe that by all sporting precedents the holders would be justified in declining any challenge for something that may not be in their possession when the time for the race arrives. The champion is always guaranteed a certain time in which he is free from challenge after a contest, and this general rule should apply here. The matter should not be left open, however, until the club is confronted with two or three simultaneous challenges, but should be decided now, either to recognize or to specifically prohibit more than one challenge in a season.

There is another question that may arise in the event of the Cup going abroad that is certainly worthy of some attention just now. The races are said to be under the rules of the club holding the Cup, and by means of the cast iron provision in the fifth clause of the new deed a refractory challenger may be forced into almost any terms, on the principle that half a loaf is better than no bread. If, for instance, the Cup were held by a British club and it should lay down such terms as those imposed on Mayflower by the owner of the Arrow, terms that no centerboard yacht should in fairness submit to, in the event of the challenger refusing to agree to the terms the holders could fall back on this clause, offer one race over their club course under their club rules, and under the latter they could at the same time refuse to admit any centerboard yacht to a race, as such vessels are prohibited by the British racing rules. Whether or no this would be done, it is possible under the present conditions, and it is by no means improbable, in view of the stand taken by a prominent British yachtsman and by forbidding centerboarders in Great Britain to race against Mayflower this year, that if the Cup should go abroad an attempt would be made either to debar centerboard yachts entirely from efforts to rec pture it or to cripple them so effectually as to prevent any chance of their success. There is little fear of this happening at the hands of such gentlemen as have come here thrice of late to race for the Cup, but it is not so certain if those who have stayed at home and written about it have any voice in possible contests, and the point should be settled at once that competition for the Cup shall be open to all vessels propelled by sail only and capable of crossing the ocean alone, whatever their construction or mechanical features. It is impossible to prohibit racing machines, it may be that some future challenger will be even less of a yacht and more of a machine than anything yet seen, but such a risk cannot be avoided. It is hardly essential, however, that the races be open to all types of yachts and that no protection of the national type be possible with any challenger.

In connection with the fifth clause another idea suggests itself, there is now nothing to prevent a change in the rules of a club after a challenge has been received, in fact we believe that this has been done in the past. Such a course is obviously unfair, and the provision should be made that any changes made in its rules by the club holding the Cup after a challenge has been accepted, should not apply to the Cup races unless with the consent of the challenger. Changes in rules are frequently made and are for the most part for the better, but it might easily occur that a wise and good rule passed by the club in good faith during the winter or spring would work to the detriment of a challenger then building, and the rules in vogue at the time of sending the challenge should be held to govern the race, unless the change is agreeable to the challenger.

There is a vital point, however, in which the deed of gift is lacking, and which demands a remedy now, before it is open to further abuse; the course over which the races are sailed. It is full time now that the New York Y. C. concedes this much to modern yacht racing, that important races shall be sailed over fair and open courses where interference and obstructions of all kinds are reduced to a minimum. Every year gives additional evidence of the utter worthlessness of the present club course for testing yachts. This spring the faults of the course were fully shown, as they have been year after year in both Cup and club races, and yet the club persists in retaining it, in spite of the serious risks involved and the protests of all unprejudiced yachtsmen, both American and foreign. If the club persists in making at least one of the races a penny show in a puddle for the benefit mainly of steamboat owners, there is no power to prevent it, but if it has any conception of the importance and dignity which international racing has now attained since Boston has taken it in hand, it will at once give up the inside course forever, and further will stipulate that all future races must be sailed on open sea courses, free from shoals and headlands, such as outside the Hook, at Newport and at Marblehead. It must not be forgotten that there are courses about England as bad or nearly so as the New York course, and the New York Y. C. has given a precedent for adopting them that is not likely to be forgotten should the Cup go abroad. Now is the time to formally repudiate this precedent, and to provide that all future races shall be sailed only over open and deep courses.

There is still another point that demands attention, the prearrangement of all future matches between two yachts of approximately equal size and rig. Holding the Cup by a victory of a fleet against a single yacht, of a cutter against a schooner, or of a large yacht over a small one is something repugnant to the instincts of every true yachtsman, who values the excitement of sailing or seeing a good race far above the ownership of the prize attached to it. Under the deed of gift all of these things are possible, and it is time that a change be made. There is little danger of two of the points being raised, but the last one is found in all the late races, the competition of one side or the other to have the largest boat. Nothing could be more absurd than the proceedings over last year's challenge, the refusal to settle preliminaries in advance, the long siege of doubt over Thistle's dimensions or even her class, the sparring for points during the long interval between the notice of a challenge last October, and the receipt of the challenge in March, and then the hurry to build a little larger boat than the challenger. Now the club is in exactly the same position as before, with an intimation of a challenge for next season, and common sense as well as a knowledge of ordinary business methods suggest a plain and simple course that must be more satisfactory to both parties than that of last year. In any ordinary transaction, either of sport or business, the parties always meet and discuss the terms which both will agree to, and there seems no reason why the races for the Cup should be conducted in a different manner. It would certainly seem reasonable that both parties should agree now on the length of yacht to be raced next year, as well as on other details, by which means the holders of the Cup will have all winter in which to construct a fleet if necessary from which to pick a single boat, while the challenger is limited to but one boat throughout. Certainly this is not unfair to the present holders, nor do they give up any advantage in entering into such an agreement. As far as the deed of gift is concerned, this is now possible without any change; but it is full time that the principle be laid down that yachts of approximately equal size shall be raced. This was not possible in the past, as challenger and defender have generally been selected from the existing fleet, but the time has come now when both are especially built for the Cup races, and as such is the case, it should be recognized in the conditions that govern them.

We submit then the following general conditions as essential and at the same time perfectly fair to all, while they seem well calculated to guard the interests of international racing for an infinite time:

First—The races shall be open to all legitimate sailing craft capable of proceeding to the point of racing without aid.

Second—The races shall be sailed only over open water courses, free from shoals and headlands.

Third—No change in the rules made after a challenge has been accepted shall apply to the races without the consent of the challenger.

Fourth—The waterline length shall be given in the challenge, the tonnage being omitted.

Fifth—The question of accepting more than one challenge at a time shall be definitely settled.

The above suggestions are only in a crude form, and a thorough discussion of the subject may develop points of equal importance. In regard to outbuilding and the prearrangement of size, all may perhaps be settled as well by such action of the club as will establish a precedent, as by any formal restriction in the deed of gift. In one way or the other, however, it should receive the earnest attention of the club, as well as of the committee on the deed of gift, as by its means much may be done to advance the waning fortunes of New York yachting.

FROM BAY RIDGE TO BOSTON.

THE great races of the year and the repeated victory for the Boston boats have so engrossed the general attention that events of the first importance to yachtsmen are allowed to pass without notice. In the universal jubilee over the triumph of the new compromise boats all else is swallowed up in the one matter, that Britain has failed again to capture the America's Cup; but if New York would, for her own good, take time to look quietly at her domestic affairs, she would find but little cause for pride or boasting. Everything in yachting from the victory of the Volunteer downward, tells the same story of the overthrow of the old idols once worshipped by New York yachtsmen, and the failure to supplant them with anything new or modern. The failure of Pocahontas was a surprise to nobody, but as this was not enough, another old time sloop was built to demonstrate the fallacy of modern ideas, and that the world does move backward. Fortunately these laudable efforts met with a signal failure when Anaconda turned tail and ran home at Larchmont. Following close on the heels of this miserable exhibition of the national type came the collapse of another of New York's champions, the disaster to Gracie, the drowning of one man, the peril to the lives of many others, and the narrow escape from a fatal capsize of one of the larger yachts. It seems, however, that even this was not the end, that the dying season had still more in store, and the last blow of all has now fallen when Grayling goes to Boston to be modernized, to be Burgessized, to be Bostonized, to an extent that will enable her to keep up with the fleet.

Grayling's history is an interesting one. Built four years since in the height of the battle between the old and new schools, she was the supreme effort of the defenders of the skimming dish, and the upholders of rule o' thumb methods. Before launching she was heartily condemned by many and as lavishly praised by others, including nearly all the New York papers, and on her trial trip she vindicated the position of her opponents and covered her friends with confusion by quietly capsizing in the Bay in a puff of wind and sinking to the bottom. The daily papers which to-day speak so loudly for depth and lead ballast, then rushed to her defense with ridiculous excuses and lame attempts to bolster up the wild theories that upset and sank with her. Raised and refitted at heavy cost, and ballasted far below her intended waterline, she has proved very fast in her class for three years, but after one trial with the new Sachem last year she dropped from the ranks, and this year has left the new boats, Sachem and Iroquois, to fight alone. In a racing boat with a racing owner this of itself is a sufficient confession of inferiority, but it is further corroborated by the fact that last week Grayling sailed with Volunteer on Boston, where she will go into the hands of Mr. Burgess for extensive alterations in hull and rig, a new stern, a deepening of the hull, and a lead keel of 25 tons. Whether or no she will be able to keep up with the procession when she re-enters the racing ranks is a matter of doubt, but this much is certain, she will be anglicized and Bostonized to a degree that will separate her forever from Bay Ridge, and if she should prove a success it will be but one more for Burgess and Boston, and one less for New York and rule o' thumb.

Side by side at Poillon's yard in 1883 were Grayling and Fortuna, centerboard and keel; and the criticism passed on Fortuna by one of the great admirers of Grayling was, that she might make a good boarding house, but never would be a yacht. After five seasons it is amusing to see how this dictum has failed. Fortuna has won a place at the head of the keel fleet, and has hurried the fastest centerboards more than once over American courses; she has carried the American flag with credit in foreign waters, and this year has found none of the British fleet able or willing to face her on equal terms. Grayling began her career by an escapade that brought wide disgrace to American yachting, her exploits otherwise are confined to races in light and moderate weather, in which she has proved very fast, but at last she goes over to the enemy, takes to the lead keel that once would have made her "logy," but now is relied on to make her safe and fast. Boston's record is written at home and abroad this season, Volunteer, Sachem, Pappoose. What is New York's for the year? Palmer, hauled out for conversion to a keel boat; Pocahontas and Anaconda, dead failures as racers; Gracie, narrowly escaping a fatal capsize; Grayling, sent to Boston for a lead keel and English counter. At this time of rejoicing over Volunteer's triumph, New York may be excused for wasting a little time in self-congratulation over the second-hand victory that Boston has won for her thrice in succession, but the sooner she settles down to a thorough consideration of the above hard facts, the better for the future of her yachting interests.

CYTHERA AND NONPAREIL.—On Oct. 5 a match was sailed between the two yawls Cythera, W. A. W. Stewart, and Nonpareil, S. B. Pomeroy, the course being from the Narrows around Sandy Hook Lightship. The wind was light from the westward, increasing a little later on. Nonpareil led at the start, but Cythera passed her inside the Hook, leading by 3min. at the Lightship, and increasing the distance to 7min. at the finish. Nonpareil won, however, on allowance. The steam yacht Hinda, Mr. F. P. Osborne, accompanied the yachts

DORA AND CHAS. WELDE.—A match was sailed on Sept. 30 over the Larchmont Y. C. course around Execution, Matinnicock and Captain's Island, 20 miles, between the sloops Dora, owned by Rudolph Oelsner, and Chas. Welde, owned by Chas. Welde, for $150 per side. The wind was blowing very strong with a good amount of sea in the Sound, and the Welde was soon so badly disabled that she put back to Larchmont. Dora sailed the course in 3h. 48m.

FANITA AND ULIDIA.

IN consequence of the challenge of the Corinthian Y. C., lately published in FOREST AND STREAM, a match for $250 per side was arranged between sloop Fanita, J. D. Hatch owner, and cutter Ulidia, Admiral E. M. Padelford owner, to be sailed from Execution Light around Long Island, finishing off Sandy Hook Lightship, a distance of about 200 nautical miles. Fanita is a centerboard sloop of the old type, modeled by Mr. Philip Ellsworth, and is 44ft. L. w. l., 17ft. beam and draws 5ft. with all ballast inside, and sloop rigged, though this year she has replaced her single jib by a double head rig. Ulidia is an extreme cutter, designed by Mr. Fife, Jr., of Fairlie, 42ft. l. w. l., 7ft. 2in. beam, and draws 8ft. On Oct. 7, at noon, both were off Execution Light, with an ebb tide and light southwest wind, the day being clear and warm and water smooth. The start was made at 11:48, the two being timed:

Fanita.....11 51 30 Ulidia 11 52 30

Both set spinakers to port, Fanita also carrying a balloon jibtopsail. For awhile the two ran very close, but Fanita finally drew ahead. Capt. John Van Buskirk, who was sailing her, held close in to the Long Island shore, while Ulidia, under Captain Harry Craven's pilotage, went further out into the Sound, meeting more of the flood tide that was by this time running. At 2:30 Fanita was off Eaton's Neck, at sunset she took in spinaker, the wind heading a little, and at dark, as it freshened from S.W. again, the ballooner and clubtopsail came in. After some light airs and calms Fanita made Greenport Light at 10 P. M. The wind now came from N.E. and helped her through Plum Gut, and at 2:40 she was off Montauk Point with very little wind, being becalmed for some time, during which Ulidia gained on her. In the morning the wind was N.W. and at 9:15 A. M. Shinnecock Light was passed. With more wind Fanita made Fire Island Light about 3:50, and Ulidia passed it two hours later. At 10:14:30 Fanita reached Sandy Hook Lightship, Ulidia finishing at 2:27 A. M. The times are:

	Start. Friday, A.M.	Montauk. Sat., A.M.	Finish. Sat., P. M.	Elapsed.
Fanita	11 51 30	3 00 00	10 14 30	34 23 00
			Sun., A. M.	
Ulidia	11 52 30	3 30 00	2 27 00	38 34 30

While such long races are apt to prove little, the present one seems to have been favored with very even weather for both boats, though the conditions throughout were those under which Fanita has always been most successful, smooth water and a fresh breeze. The record has been broken by both boats, Fanny's time in 1884, being 43h. 27m. 10s., but that race was a drift nearly all the way.

THE DEPARTURE OF THE VISITORS.

THIS week will be the last of the visit of the challengers of 1886 and 1887, as all will sail for home. On Tuesday Lieut. Henn and his wife sailed from Bay Ridge at noon in Galatea, after a visit of over a year, in which time they have won the regard and kindly feeling of all who have met them. The ship was fitted with short canvas for the voyage, all her spare gear and racing outfit being stored at South Brooklyn. Lieut. Henn has declared his intention to return next year, though he may not bring out Galatea, in which case the gear will be shipped home by steamer. Before leaving there was some difficulty with the crew, who demanded a passage home by steamer, but it was satisfactorily settled. Capt. Bradford is still in command, and he and Lieut. Henn will navigate the yacht. The Scotch visitors, including Mr. and Mrs. Bell, Messrs. Watson, York, Wylie, Fife, Ratsey and others, left on the City of Rome, on Wednesday. On Tuesday night a dinner was given at the New York Y. C. house in honor of Messrs. Bell and Watson. Com. Gerry welcomed the guests in one of his witty speeches, to which Vice-Com. Bell replied as follows:

COMMODORE AND GENTLEMEN: I can assure you to-night that I feel in a very difficult position. The kindness we have received has been overwhelming. Everything has been done to make our stay here a pleasant one. From beginning to end all the negotiations have been marked by a spirit of fairness. Everything that has been done has been done in the most liberal spirit. Your ways are different from our ways. Probably our ways are worse than your ways and yours are better than ours. If we have done anything that has given offense to any one it has been done in ignorance of your customs, and I hope that our ignorance will be deemed a sufficient excuse.

We appreciate the kindness we have received from you. Although we did not capture the Cup we feel that we have captured your hearty good will. When we came here the first thing that we were offered was the hospitality of every club connected with yachting. One and all placed their club houses at our disposal.

Will you now allow me to thank you Mr. Handren, of the firm of Handren & Robins, who came forward in the kindest way and said: "Gentlemen, if you will use our dock I shall consider it a privilege if you do so free of expense if you will accept it in the name of the New York Y. C." Gentlemen, we appreciate the courtesy which prompted the offer more than the value of the money. We appreciate all these things, and when we go back to Scotland and tell all that has been done we can do so with a feeling that we have been received in a way we hardly expected.

I wish now to say something regarding Captain Gibson, of the sloop Gracie. I have been deeply pained by the report that Captain Gibson was responsible for the short tack inshore. There was a short tack, but allow me to say that he did not advise this, and did nothing but what met our hearty approval from beginning to end, and we are very grateful for what he did that day.

I have now to thank you again for the many little acts of kindness, and can assure you that they have touched our hearts deeply. We have been treated liberally, and if anything has been given it has been against the New York Yacht Club and not against ourselves. I can only say that if we ever win the Cup we shall not alone do our best to defend it gallantly, but will do our utmost to return all kindnesses.

Here is a model of the Thistle. It is not the custom in our country for owners to possess a model of their yacht, but Mr. Watson begs that the club will accept this as his gift.

I have been requested by Commodore Clark to express his regret at not being able to accept; he also is the recipient of too boundless hospitality.

Messrs. Paine and Burgess were present at the dinner, but Com. Clark, of the Royal Clyde Y. C., was absent. Thistle has shipped her cruising spars and will sail to-morrow for Glasgow, in charge of her original crew. Captain Barr will be in command, with Captain Donald Kerr as navigator.

THISTLE TO WINDWARD.

Editor Forest and Stream:

Since writing the "Review" published in your columns last week, I have had the pleasure of discussing the subject with Mr. G. L. Watson. Before he had read the "Review," and without intimation on my part, he volunteered the statement, that in his desire to secure light-wind footing, he had cut down lateral resistance below the amount requisite for hanging on to windward. He furthermore agreed that too much stress is laid upon wet surface among British architects, and the anxiety to keep down Thistle's skin to the smallest area possible was the cause of her deficiency in lateral resistance. Mr. Watson mentioned a case in his own experience. He once added materially to the keel and wet surface of a yacht, and so far from footing slower, she actually went faster through the water with same area of sail.

No doubt the theory of skin friction, as accepted abroad, needs revision in its application to yachting practice, and the Thistle's defeat will in that respect be of direct benefit to the "doctrinaires" across the big pond. We in America have never accepted the theory except as a theory, the exact value of which in yacht design is still speculative, and events seem to show our doubts well founded.

Even Volunteer is a case in point, for she has more skin in proportion to sail than Mayflower without showing appreciable difference in light wind footing.

"I think we will show them something yet," were Mr. Watson's last words. In these I fully concur, being convinced from Thistle's speed through the water, that it is only necessary to produce a cutter free from specific fault, to effectually abolish the centerboard vagaries in the largest class, as they have already been abolished by the success of cutters in the smaller classes.

C. P. KUNHARDT.

HONORS TO GEN. PAINE AND MR. BURGESS.—On Friday last a public reception was held in Faneuil Hall in honor of Messrs. Paine and Burgess. A very large number were present, and speeches were made by some of the leading men of Boston. Gen. Paine and Mr. Burgess as well as the crew of the Volunteer were present, but Captain Haff was too ill to attend. On Saturday evening a welcome to Volunteer was given at Marblehead, where she had arrived on Friday afternoon. She had left New York on Tuesday, lying at Whitestone all night and sailing at 9 A. M. on Wednesday, in company with Grayling. Wednesday night was passed at New Haven and Thursday night at Holmes Hole, being finally taken in tow off Boston by the Boston *Herald* tug. On Saturday night all Marblehead was illuminated with lanterns and huge bonfires, while on the water was a procession of dories in tow of the steamer Brunette, all of them illuminated with Chinese lanterns and colored fire. Cannons and mortars were mounted on Fort Sewall and along the rocks, from which salutes were constantly fired. A band on the Brunette played as the procession passed around the harbor and by the Volunteer. A series of resolutions passed by the town was presented to Captain Haff, on board Volunteer, and copies were sent Messrs. Paine and Burgess, together with two handsome ivory paper knives of Indian manufacture. The subscription fund for testimonials to Gen. Paine and Mr. Burgess is growing rapidly. Invitations to a public banquet in New York have been declined, but Gen. Paine and Mr. Burgess will be present at the dinner given by the New York Y. C. in their honor, at Delmonico's this evening.

DELAWARE RIVER TUCKUPS.—The mention of these peculiar boats in the FOREST AND STREAM this year has attracted attention to them outside the locality where they are used. A correspondent asks for the address of a reliable builder, and another asks at what angle the boom should be trimmed in sailing free. Perhaps some of the Delaware River sailors will answer both questions.

AMERICAN Y. C.—On Oct. 5 the American Y. C. gave a dinner to Messrs. Bell and Watson, with others of the Scotch yachtsmen, at Delmonico's. The new steam yacht challenge cup, costing $12,500, was exhibited for the first time.

A NEW CATBOAT.—Messrs. Wallin & Gorman have lately completed a deep catboat for Capt. G. P. Wilcox, of New Bedford, a cabin boat 26ft. long, with square stern, 12ft. beam, 3ft. 6in. depth, and 3ft. draft.

VERVE AND CYPRUS.—On Oct. 1 the final race for the Lansdowne Cup was sailed between Verve and Cyprus, in a good breeze, Verve winning easily. Her time over the 21 mile course was 4h. 15m.

VERA.—This fast little keel boat is for sale, as advertised elsewhere. She has been remarkably successful as a prize winner about Marblehead.

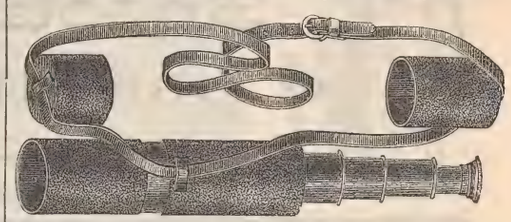
TORONTO Y. C.—The postponed race for third class was sailed on Oct. 1, with five entries, Mischief finally winning.

PALMER.—This schooner was hauled out at Poillon's last week for alteration from centerboard to keel.

DECOY, sharpie, has been sold by John H. Dimon to Henry S. Wood.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**



G., Huntington, Pa.—We have no record of the dog mentioned. Perhaps the breeder of your puppy can inform you.

IRISH.—1. In what kind of a place can I keep a bitch when in heat, so as to avoid annoyance? 2. How many times has England tried to win the Cup? Ans. 1. Keep her in a room up stairs with plenty of sawdust on the floor. 2. England has made four attempts to win the Cup, Canada two and Scotland one.

SUBSCRIBER, Elizabeth, N. J., Oct. 4.—Every Sunday for two or three months past regularly parties of gunners infest the point at Tremley, near Tremley station on the Long Branch R. R. Could you not send a representative of the New Jersey Game Protection Society to arrest such offenders? Ans. Report to W. L. Force, Secretary New Jersey Game and Fish Protection Society, Plainfield, N. J.

PUBLISHERS' DEPARTMENT.

MESSRS. JAMES W. QUEEN & Co., of Philadelphia, manufacture a spyglass of very superior quality. We have recently had an opportunity to test the instrument and have found it to be most satisfactory in power and clearness. The glass is readily carried,

or, as they say out West, packed; it is protected by a strong leather case, and has every appearance of being capable of standing a deal of hard usage without being any the worse for it. If with its aid one cannot see a deer wink a mile away it will be because the deer will not happen to wink while one is looking at him.

ABBEY & IMBRIE, Manufacturers of Fine Fishing Tackle,
18 Vesey Street (Fourth door from the Astor House), New York.

The Schultze Gun Powder Company, Limited,
82 GRESHAM STREET, LONDON, ENG.,
Have the pleasure to announce they have opened an agency for the sale of their well-known Smokeless Sporting Powder, the

IMPROVED
GRANULATED WATERPROOF

Schultze Gunpowder,

At VON LENGERKE & DETMOLD, No. 8 Murray Street, New York,
Where it may be obtained at WHOLESALE OR RETAIL. Price, $1.00 the canister, equal to 1 lb. Curtis's & Harvey No. 4 Black. Dealers' discount on application.

The Schultze Gunpowder has firmly established itself in England and on the European continent as excelling all rivals, giving GREATER PENETRATION, CLOSER PATTERN, LESS RECOIL, LESS SMOKE, LESS FOULING than any other powder. It has *no prejudicial effect upon the barrel*, and is *practically unaffected by damp*. Charge as compared with best black powder equal by measure or half by weight. **It is loaded with the utmost ease exactly as black powder.** It requires *no ramming* or pressure in loading. American cartridge manufacturers are now experimenting with a view to issue a primer of the same strength as the English primers to do away with any possible slow fire or the necessity for priming with a few grains of fine black powder.

As regards trap shooting performances, Schultze Gunpowder is the champion powder, having been used by the prize winners at all the principal meetings both in England and on the continent during the last eight years. During the late international week at Hurlingham and the London Gun Clubs, June 13-18, 1887, the gentlemen who used Schultze secured prizes amounting to £3,200, against £500 won by those using all other explosives combined. Numerous experiments carried out by the English Proof-House Guardians, and by the editor of the London *Field* and others have proved beyond question that Schultze Gunpowder, while being equal in propelling force to the best English black powders, gives less pressure on the barrel even when subjected to varying temperatures, and is therefore as safe to use as black powder.

FULL DIRECTIONS ACCOMPANY EACH BOX.

Sold by Dealers in Sporting Goods, or Mailed to any Address on receipt of $1 per Box of 50 Pills.

These pills consist of a happy combination of such medicines as are most effectively used as Alteratives or Tonics, and while they can never hurt any dog they will be found a Sure, Safe and Quick Remedy or Preventative in nearly all cases of sickness to which dogs are subject.

Testimonials:

—:o:—

Messrs. Polk Miller & Co.:

GENTLEMEN—The formula which you are using under the name of "Sergeant's Condition Pills," for treatment of dogs, is the result of many years' experiment and very extended experience on the part of both of us. Your Mr. Polk Miller is not only a practical chemist, but one of the most ardent sportsmen I ever knew. We have together finally settled upon this Pill as accomplishing more as an alterative and tonic for canines than any we have ever met. There is no mystery about the ingredients whatever, and the virtue of the Pills consists in their being simply the best combination of well-known medicines which we could desire to accomplish the end in view. I use nothing else with my dogs now, although I have tried all the different remedies.

I regard this Pill as the surest, most prompt and efficacious medicine I ever used in cases of distemper.

It will make a dead dog eat. In mange, scratches and skin diseases of all sorts it acts like a charm and drives the disease away. It has superceded with me altogether the troublesome use of Fowler's solution. It leaves no bad effects and combines in one formula all the different things which, under some veternary books will occupy a man half a day dosing a sick dog. I am sure that whoever uses it will give you all the testimony you want. There is no quack about it. You have begun to prepare it for the public, because, in our private experience, we have found it better than anything else we have ever tried. Yours respectfully,

JOHN S. WISE.

PITTSBURG, Pa., May 12, 1887.

Polk Miller & Co.:

DEAR SIRS—Please find enclosed $1.00 for one box of your "Condition Pills." Give me price for taking half dozen at once. I think the last box has done my dogs very much good, and I would take half a dozen boxes at once if given at reduced rates. Yours truly,

A. STUCKY.

YARDVILLE, N. J., Aug. 28, 1887.

Polk Miller & Co.:

DEAR SIRS—I promised to let you know what effect, if any, "Sergeant's Pills" had on my dog; I will fulfill the promise now. I gave him 26 of the Pills altogether. Could see no change for the first four days, but after that he began to have some relish for food, and I could see that what he ate did him good, as he began to gain in flesh. His nose is much more moist, and for longer at a time than before he took the Pills, and he is seemingly in good spirits. I do not say, as does the Hon. J. S. Wise, that the Pills "will make a dead dog eat," but I do say that they seem to have helped my dog, and I believe that any one having a dog left weak by distemper, with no appetite and no disposition to put on flesh or gain strength, will find these Pills an excellent remedy, and I can recommend them for that fully. Is it your opinion that I best give the remaining Pills? If you see fit, you are fully at liberty to make use of this note in your advertisement, or to refer inquirers to me.

Very respectfully yours,
THOS. C. ABBOTT ("Recapper").

LYNCH'S, Va., Aug. 25, 1887.

Messrs. Polk Miller & Co.:

DEAR SIRS—After a thorough test of your "Sergeant's Condition Pills," I find them by odds the best tonic I have ever used on a dog, and shall keep them on hand hereafter, and discard all of the liquid tonics that I have heretofore found it necessary to use; as, while the Pills act better, they are also much easier administered, and I am satisfied as they become known they will be used exclusively by dog men. Yours, etc.,

WM. TELL MITCHELL.

ST. JOSEPH, Mo., June 7, 1887.

Messrs. Polk Miller & Co., Richmond, Va.:

GENTS—For enclosed $5.00 please mail me five boxes "Sergeant's Condition Pills" for dogs. The two boxes you sent me some time ago have done first rate; one box I used on one of my dogs for some skin trouble, the other I gave to a friend whose dog was in a low condition and off his food.

Very truly yours,
PAUL FRANCKE.

LYNCH'S, Va., Aug. 21, 1887.

Messrs. Polk Miller & Co., Richmond, Va.:

GENTLEMEN—I have tried different remedies, and I now say that your Pills are the best canine medicine I have ever used; they put new life in a dog, and give him an appetite that it always pleases his master to see him eat. I recommend them to all who have dogs, and will further say that after they try them they will use no other. Accept my thanks for the Pills you sent me; I found them to be what they were recommended to be. Hastily, but very truly yours,

E. TAYLOR.

Testimonials:

—:o:—

LOUISVILLE, KY., May 12, 1887.

Messrs. Polk Miller & Co., Richmond, Va.:

GENTLEMEN—On a recent visit to my farm in Virginia, I found my old dog Dash and my one-year-old puppy Cobham very much out of condition. Cobham was almost a skeleton. Their hair was bunched up, rough, and they would eat nothing—could scarcely get on their feet. I treated them for worms, without result, and, as I told you in Richmond, I decided on my return to kill the puppy. You told me of "Sergeant's Condition Pills," and asked me to try them first. I agreed to do so, but I am free to confess that I had no faith in them. I am now glad to say to you that on Saturday last I saw Dash and Cobham; they were both in as good condition as any two dogs on earth. My colored man says they certainly did eat after I gave them the Pills you left; all of which tends to assure me that you have a good thing. Send me two boxes.

Yours very truly,
H. W. FULLER,
Gen. Pass. Agt. C. & O. Ry.

DAYTON, O., May 11, 1887.

Messrs. Polk Miller & Co.:

Enclosed find $1.00 for another box of Pills. The one box has improved my dog Pat Snuzer wonderfully. For a year the dog had no life, acted more like a dog ten years old (he is only 2½ years old); since giving him your Pills he jumps and is cheerful, like a pup. I will always have a box of "Sergeant's Condition Pills" on hand. I think another box will bring him out all right. He has something like the mange; have used —— Mange Cure.

Yours truly,
GUSTAV SANDER.

WHITE POST, Va., Sept. 5, 1887.

Polk Miller, Esq.:

MY DEAR SIR—You ask for my experience with the "Sergeant's Condition Pills." In a few words I will say, honestly, that I do not believe their equal has ever been invented, for I consider them a panacea for every ill to which dog flesh is heir. I have tried them in distemper, in broken down constitutions from distemper, in mange, in cases when the hair upon the dog was turned wrong side out, fits, and the devil knows what else, and have found them good every time. I have never tried them on a mad dog, but have no doubt if you could get a fellow to administer them, that they would cure him. In time, I would just as soon think of being without dogs as without the Pills, and hope never to be without either.

Very truly,
WM. C. KENNERLY ("Old Dominion").

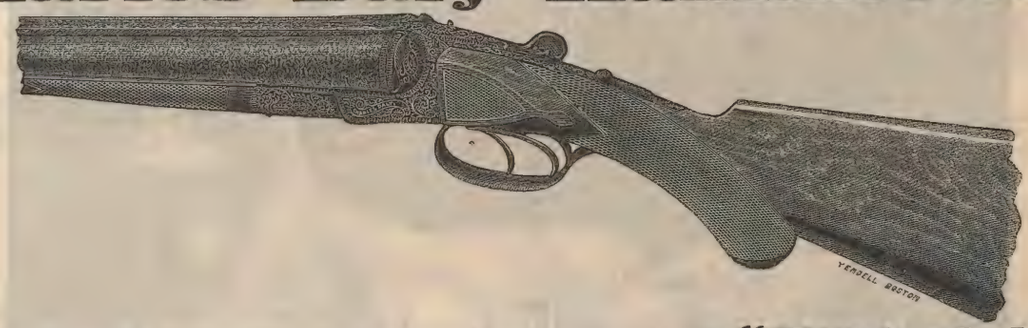
SOLE PROPRIETORS.

CHARLES DALY 3-BARREL.



The success of this gun introduced last year has exceeded our expectations. The maker's name is a guarantee of perfection in workmanship and every other desirable quality in a gun. The rifle barrel is rifled on a new system, which gives perfect results. The barrels are put together (a difficult thing in a three-barrel gun) with perfect accuracy. IT IS A GREAT CONVENIENCE TO ALWAYS HAVE A RIFLE WITH YOU. THE EXTRA WEIGHT IS NEXT TO NOTHING.

12-Gauge are made with rifle barrel, .32 W. C. F., .32 Marlin, .38 Marlin, .40 Ballard, .45 Government. Price, 85.00
10-Gauge " " " " " .38 Marlin, .40 Ballard, .45 Government. - - - - " 95.00

THE SHOT BARRELS ARE FINE DAMASCUS.

Charles Daly Hammerless.

As an evidence of the worth and increasing popularity of this "Best of the Hammerless," the sales this spring have been nearly double those of any former spring season. Alongside of any other make, costing 50 per cent. more, they excel in every respect. Especially in the remarkable close hitting and consequent solidity and lasting quality, and long-distance shooting. Here is a letter from one of the best shots in the South, who, like hundreds of others, believes the Daly is the ONLY gun:

CHICAGO, April 28, 1887.

F. P. TAYLER, ESQ.—DEAR SIR: The Hammerless Diamond Daly ordered herewith is to be the same weight, drop and trigger pull as my old gun purchased of you in the spring of 1881. The old hammer gun and I will never part company if it can be avoided, and I only hope the new one will prove as good in every respect. I do not expect to get a better one, because I do not think a better one can be made. This gun has been shot in the field and at the trap during the past seven years more than falls to the lot of half a dozen ordinary guns, and it is still solid and good for many years more hard shooting. It carried off the $500 Diamond Badge, representing the State championship of Illinois in 1885, when, owing to a gale of wind and strong birds, very close, hard shooting was required to stop a bird within bounds. In this contest many of the guns (57) on the grounds did not do justice to the men who held them. Now, I want as fine a gun as you can turn out. If it is too pretty to shoot with I have the old one to fall back on. I can only say in conclusion that I am wedded to the Daly gun, and intend to own one as long as I can carry it.

Very truly yours,
GEO. T. FARMER.

SELF-COCKING.

Automatic Ejecting.

This new Revolver is now ready for delivery. It is almost a fac-simile of the celebrated SMITH & WESSON, and is guaranteed equal in quality and finish to **any pistol in the World.** At present will be made only for the .38-caliber S. & W. cartridge. .32-caliber to follow.

Retail Price, $11.00.

NEW YORK CITY.

The Forest Waters the Farm;
OR,
The Value of Woodlands as Reservoirs.
BEING THE LES ÉTUDES DE MAITRE PIERRE SUR L'AGRICULTURE ET LES FORETS.
PAR M. ANTONIN ROUSSET.
Translated by
REV. S. W. POWELL.
The introduction reviews the extraordinary movement of torrent taming in France, in preparing public sentiment for which the Studies of Master Peter played a noteworthy part. The book was written as a sort of science primer, setting forth the first principles of the relations existing between woodlands and agriculture. The principles and reasoning are not less applicable to the United States to-day than to France then.
Price in cloth, 75 cts.; paper, 50 cts.
FOREST AND STREAM PUBLISHING CO.
39 Park Row, New York.

FOREST AND STREAM PUB. CO.,

39 Park Row, New York.

Dr. WARNER'S Health Underwear,

MADE OF TWO QUALITIES,

Selected CAMEL'S HAIR and Pure NATURAL WOOL.

Five Reasons for Wearing the Health Underwear.

1st. Camel's Hair and Wool are twice as warm as the same weight of Cotton or Linen.

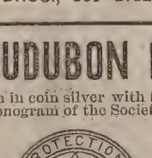
2d. They protect the body against excessive heat and against drafts and sudden changes of temperature.

3d. They are an important protection against colds, catarrh, consumption, neuralgia, rheumatism and malaria.

4th. They cannot crock, fade or poison the skin, as they are *natural colors* and contain no dyes.

5th. The Camel's Hair is warranted to wash without shrinking.

Manufactured in all styles of Gentlemen's, Ladies' and Children's Underwear and Night Shirts.



FOR SALE BY LEADING MERCHANTS.

Catalogue with Prices sent on application.

WARNER BROS., 359 Broadway, N. Y.

THE AUDUBON BADGE

Is a brooch pin in coin silver with the motto and monogram of the Society.

Chaste in design and tasteful in execution, it presents an attractive appearance, and is protected from tarnishing by a beautiful satin finish on its surface.

We are now in a position to execute orders for these badges to any extent. Wherever they have been sent they have met general approval, and every member of the Audubon Society should wear one as a reminder of the pledge and an open declaration of principles.

ANSWERS TO CORRESPONDENTS.

A WORD FOR THE DOG.

PERHAPS he has not been hunted before this season; it may be that he is just off from chain, and not in what one would pronounce field trial condition. His muscles are flabby, his flesh is soft, and long continued work will not only tire him for the present day but will be quite apt to incapacitate him for the next day. Unless old and steady, his spirits will be exuberant, as well as those of his master; and on this account he will be deserving of quite as much forbearance and patience on his master's part as his master will require of his own conscience. A short preparatory run where there is no game will often tone down a dog under such conditions and fit him for work.

If one be away from home on a hunting expedition, the first care should be to see that the dog has proper quarters for the night; and the care of him should not be delegated to the hotel servant, but the master should by personal inspection assure himself of the comfort and proper feeding of his dog. For hunting a dog should be fed very sparingly in the morning. Give him a bite or two of your lunch at noon, and let the full meal be given at night after the day's work is finished. A dog will not hunt well on a full stomach, nor will his food digest while he is working in the field. If you have a brace of dogs work them alternately; let one do the hunting while the other is resting at heel. Do not permit a dog to lie in water for any length of time while afield; though an occasional plunge will do no harm.

The first care upon returning at night should be to examine your dog to see if any harm has befallen him. A slight hand rubbing all over will discover if he has met with any accident from thorns or briers; if any of these are found they cannot be removed too quickly. Special attention should be given to the feet. If these are inflamed and have the appearance of being made tender by his work, they should be bathed in beef brine, which can be procured from any butcher or at almost any farm house. If the skin be much worn, or the foot wounded, vaseline should be applied; and if very badly off, the dog should be laid up until in condition again. Here, as elsewhere, an ounce of prevention is worth a pound of cure. Slight attention paid to these matters will insure a dog's good condition, while neglect will often cost dear.

So much for the physical well-being of our brute field companions. It might be added that their efficiency and good performance will be increased if they have a good example in their masters. Nothing is more conducive to a dog's unsteadiness and flightiness than the unsteadiness and flightiness of the human being who is handling him. No man who cannot control himself should attempt to control a dog.

NOTES AND COMMENTS.

AT the Boston meeting of the American Ornithologists' Union, last week, a letter was read from Mr. William Lloyd, of Texas, telling of his observations in the arid region of western Texas to determine what birds indicate proximity to water and at what distance. The observations extend over four years and Mr. Lloyd gives the following list "as certainties," with the greatest distance at which each occurs from water: "Cardinal, one mile; warblers (including chat), one mile; vireos, two miles; mocking birds, two and one-half to three and one-half miles; blue grosbeak, the same; orchard oriole, Bullock's oriole, and nonpareil, each three miles; Carolina dove, three to five miles; black-capped titmouse, four miles; Texas cardinal, six miles. This only applies to summer, and will not hold in winter or during migrations." The letter further states that Mr. Lloyd has put the result of his observations to practical use; three times during the past summer he made camp, choosing the locality because seeing certain birds there, and finding the water indicated by their being there.

The passing of the buffalo is a phase of wild life extermination that appeals to the imagination, and scores of writers have treated it from the sentimental standpoint. The passing of the lobster is not nearly so sentimental a topic, and the magazines have given it no attention. Commercially the lobster is of vastly greater importance than the buffalo, and it is going just as surely. The buffalo we can do without; the plains, once their feeding ground, now pasture vast herds of cattle. But there is nothing to take the place of the lobster; when once that is exterminated from the coast by fisherman's greed we cannot restock the waters with a substitute. Why is it not the better plan to limit the catch by wise statutes and their enforcement? What excuse is there for the backward step taken in this State last winter when, at the dictation of a saloon keeper, then representing this city in the Legislature, the short-lobster law was repealed, and the gates were opened for the reception and sale in the New York market of "baby" lobsters from Massachusetts and Maine? It appears to be much easier to get a good law repealed than a new one enacted at Albany, and there is no doubt enough at stake among the dealers to make it worth their while to insure for themselves continued license to deal in immature lobsters so long as they last. When the mischief has been done and there are no more crustaceans to protect some one will rise up at Albany to go through the farce of legislating for lobsters.

There are some gunners who have not much else to do the year around except to crack away at whatever game happens to be in season; but the average man of the thousands afield in October is not of this class. Nine out of ten who go shooting are limited to a few days, or at the most a week or two, of sport; they come from office, workshop and counting room, and the chances are ten to one that in their eagerness to make the most of the brief opportunities of their outing, they come in at night in fit condition to realize what a blessed thing it is to be thoroughly tired out. The fatigue that comes of tramping fields and climbing fences and lugging eight or ten pounds of gun is what the Indians call "good medicine."

The number of applications received by the Interior Department for permits to hunt in the Indian Territory has been unusually large this season, coming from all over this country, and many from Great Britain. The Department has also been in receipt of numerous complaints from the Territory, where sportsmen and Indians manage to find something to quarrel about; and as a last recourse Secretary Lamar has decided to issue no more permits.

There must be a tremendous interest in robin shooting if we are to judge from the number of inquiries at this office about the open season, which will begin Nov. 1 on Staten Island and Long Island. The robin is the favorite game of many New York citizens of foreign descent, who shoot whatever comes along. These gunners have been potting robins and other birds all along, and bringing them over the ferries in the most open and unconcerned manner. Sunday is their favorite day for robin shooting, and it is then that they swarm out into the suburbs of Brooklyn and adjacent towns and make the day hideous with their racket. The Staten Islanders found a partial remedy some years ago in a local law forbidding shooting by non-residents except upon payment of a license fee. This plan might be adopted on Long Island with beneficial results so far as this particular abuse is concerned. The end accomplished by such a provision is good, though the constitutionality of the law itself has been questioned.

In these days stories of new projectiles and new explosives come thick and fast. The nations of Europe are eagerly rivaling one another to see which shall equip itself with the most terrible armaments. The latest reported novelty is a gunpowder invented by a Russian chemist. It is called "Sleetover," and its merit is said to be in the peculiar mode of explosion. Says a published account of it, "The peculiarity of the compound is that it explodes by expanding in one direction only, and that the direction in which the projectile is to be carried forward." In other words the Russian inventor has discovered a way to overcome and reverse the laws of nature hitherto governing the expansion of gases. Now he ought to devote himself to lifting himself by his bootstraps to the moon.

Mr. C. C. Goodrich, general agent of the Hartford and New York Transportation Company, has given strict orders to all persons in his employ to refuse to receive any game for transportation from Connecticut; and when Herbert Banning, of Hadlymé, Conn., attempted to ship a box of ruffed grouse to a New York dealer, the box was seized. This stand taken by Agent Goodrich entitles him to the respect and gratitude of the sportsmen of Connecticut; and it is to be hoped that other public carriers will adopt the same attitude toward market hunters. There is an extensive traffic in snared grouse; hundreds of them come to New York; and this will continue until some due provision is made for enforcing the Connecticut statute.

A Vermont farmer's inquiry about silver foxes brought out responses from a Montreal merchant and a British Columbia fur trader. A Berlin manufacturer's amusing story of the odd ways of German hunters prompted an American lady in Corfu to write of the ways of gunners in Greece. These are by no means extreme examples hinting of the FOREST AND STREAM'S breadth of horizon. Its good things come from the remote corners of the earth not less than from nearby American woods and waters.

One of the members of the Esoc Quet expedition has many wonderful things to relate of his experiences and adventures; but nothing on the entire trip appears to have impressed him so much as the naked honesty of his Indian guide, who, having shot half a dozen times at a deer and missed it, frankly said so, when a "true sportsman" relating such an occurrence would have made at least four of the balls wound the game.

The air is full of rumors of challenges for the America Cup. Canada, Ireland and Scotland talk of sending competitors. It is not probable that any definite challenge will be received before the revision of the conditions shall have been completed.

The New York Fish Commission has approved the plans for a McDonald fishway at the Troy dam, and it is said that the work of constructing it will be undertaken at once unless high water interferes.

The FOREST AND STREAM Decoration Day Trophy will be offered again, but under revised conditions, so drawn as to insure a speedier result than before, and avoid the vexatious delay.

The Virginia Field Sports Association will convene at Richmond next week.

The Sportsman Tourist.

Address all communications to the Forest and Stream Pub. Co.

A BIRD HUNT IN WESTERN KENTUCKY.

II.

TUESDAY morning, the second day of the hunt, broke clear, crisp and cold. The snow still sheeted hill and valley, and even held its own on the housetops of Wingo. The only apparent signs of melting were in the crystal fingers of icicles that hung pendent from the edges of the shingles.

Quite a little group, attracted by our presence and mission, had gathered in the cosy hotel office the night before, and in the ruddy firelight joked and chatted and marveled at M.'s tales of adventure by field and flood. The admiring audience added greater zest to his recital, and provoked a livelier coloring to his broad fund of suggestive humor. To say that under the inspiring influence of the frequent "you don't say," and "is that so," and the lively sallies of laughter that frequently broke forth, M. fairly "let loose" is but drawing it mild. At any rate, to his majestic influence we attributed our good luck in inducing one of Wingo's hunters, named Wooten, to agree to join us in our sport and show us the country.

The dogs appeared none the worse for their previous day's work, and exchanging Whit for Kate, as a reserve, we turned loose the trio—Set, Whit and Kate—and got ready for the field. Expecting a longer hunt and harder work, we engaged a team from a livery stable to meet us several miles in the country about sundown and bring us in.

Under advice of Wooten, we were to exchange the high grounds we had hunted the day before for the creek bottom that lay southward of the village. A brisk walk of half an hour along the railroad track brought us to our starting point. Going along as honorary escort were Tartt, our host, and a loquacious vender of sadirons who had dropped into the village over night. Tartt had yet to see a bird shot on the wing, and was now resolved not to let another day pass without encompassing that event.

Turning into a cornfield, M. took the right and I the left. Skirting a worm fence, I was soon out of sight in a ravine that melted away into the bottom. The ground seemed favorable, and Kate was working industriously, when a couple of shots in M.'s direction drew my attention. A moment later a covey of birds came in view, skimming up the hill and disappearing over the ridge. Calling off the black setter to more promising work, I started in pursuit, being joined by M. at the summit. Just beyond the brow of the ridge was a low depression, covered with sedge grass, weeds, and small patches of briers. Several brush piles were scattered about. Evidently the birds were close at hand.

It was only a moment before Kate's penetrating nose caught the scent along a little ridge. She suddenly halted, crept forward a step or two, her muzzle slightly elevated and her tail motionless, and stood rigid as a statue. Whit, a little higher up, backed her in fine style, and Dyke held another bird lower down. Taking the right and M. the left, we walked in to flush. Both birds went up together, mine circling high across the hollow, and dropping dead to the shot. M. was not so fortunate, though a bunch of feathers floated down the air. He scored a hit immediately after on a bird that flushed in the bottom. A third was joint property, as it fell at the report of both guns, that sounded almost as one shot.

Tartt was delighted, and had he been twenty years younger would at once have begun training as a champion wing shot. His enthusiasm received a slight check at our next display of skill. Dyke found something in a pile of brush; Kate and Set agreed in the point. Kicking into the pile, out went two birds that scudded over the hill unharmed by the whistling spheres that followed after. M. added one more bird to the bag that got up on the edge of the next hill, and following another to the mouth of the copse, I caught the sun in my eye as the bird rose over the bushes, and scored a miss at the same time. We found no other birds of this covey.

Crossing the bottom, M. got over the fence into a cornfield, which we afterward learned was posted ground. In a few minutes he had a covey up and driving through the standing corn. They scattered along a rail fence in some clumps of weeds and briers. Before I could get up M. had dropped one in front, and wheeling quickly, scored a second that got up in his rear. Throwing in another shell, he had a third fluttering on the ground before one could say Jack Robinson. Tartt, who was watching the shooting, was absolutely astounded.

"Don't that beat Jerusalem!" said he. "He killed that one going that way and this one going this way, and one more makes three, without movin' or missin'. Never saw the like before."

That night when we returned to Wingo we found a hot dispute going on among the boys over M.'s shots. One fellow insisted that all three birds were bagged by M. without reloading, and nothing but M.'s word would settle the dispute.

The last covey we did not hunt further, as one of the party proffered the information that the land was posted, and "that fellow on the hill would come a-tarin' when he heard the shootin'."

Most of the corn in the valley was yet uncut, and the broken and bent stacks lying here and there on the ground put the ears in easy reach of the hungry birds, deprived by the snow of their usual supply of ground seeds. In a thick patch of grass and weeds, in the middle of a cornfield, a fine covey was started, wheeling on the flush and driving straight for a patch of woods. Three or four fell to our bag for reminders before the covey left the corn. These birds were unusually wild, and though we followed them some distance among the trees, they refused to lie to the dogs, running before them and flushing before we got within fair gunshot. An immense brown owl, scared from his sleep by the noise, flew into a big oak, and, at the urgent request of a farm lad who had joined the party, it received a load of No. 8s and came flapping to the ground. The lad claimed there would be more chickens next spring as a tribute to his owlship's demise.

Keeping up the creek, which was now little more than a dry run, with scattered pools of water hard frozen, we finally struck the country road at a log bridge. Beyond this the bottom was covered with standing corn, extensive copse of briers and brush, with clumps of weeds and heavy grass. It was a royal place for birds, but a bad place to shoot, as the results showed. I was the first to cross the fence, barely landing on the other side when a small covey rose almost under my feet. Though startled, I managed to drop one bird. The covey scattered, several crossing the road and one alighting in a tree in plain view. Thinking to drop him easily with my left barrel, I hastily raised and fired a snap shot. To my amazement he flew off unharmed. The laugh was on me, and M. suggested to catch a bird and tie it and give me a chance to practice.

During the remainder of the afternoon birds were plentiful, no less than half a dozen coveys being flushed; but the unfavorable ground made shooting hard, and after the first rise the birds went straight to the thickets, where it was almost impossible to follow. The dogs fared badly among the briers and burrs, Set finally refusing to go in at command. The red streaks showed plainly through her thin coat, telling how roughly she was being punished.

About sundown the wagon came to the bridge, and we were glad enough to jump in, being thoroughly wearied with the day's tramp through the snow. We counted out on the office floor that night thirty-two partridges as the fruits of the day's hunt, besides several rabbits knocked over to supply our friends.

Wednesday we planned to begin our hunt where we left off the day before, and to go further up the valley. Dyke, Whit and Kate were uncoupled, and Set left at home to nurse her wounds and rest for future work.

Entering the cornfield near the bridge, where I had failed to make an impression on "a bird up a tree," we had scarcely gone 200yds. when Dyke, by too eager trailing, ran into and flushed a large covey. I saw and marked down "about" where they dropped near the edge of the creek. Approaching the spot cautiously the dogs were sent in. Every inch of ground was hunted, and every patch of weeds and grass thoroughly examined. The dogs roaded eagerly over the frozen ground, but not a bird rose. We were nonplussed, until finally Dyke crossed the creek, and mounting the opposite bank, flushed a bird on top. The other dogs crossed at once, and we hastily scrambled after them.

We found Kate, Dyke and Whit frozen to a point on almost barren ground. Kate's lips were opening and closing as if the scent were strong enough to taste. Moving in, half a dozen birds arose, M. dropping one, scattering feathers from another, and I getting in a miss. The climb up the bank had blown me. Behind us Whit began to run the furrows of some plowed ground. There was no cover, and the birds were running. M. got a shot at and wounded one that kept up a zig-zag flight until it crossed the top of a farmhouse a quarter of a mile away. He scored a miss on a long shot at another that went to the thicket. The balance of the covey flushed out of range and scattered badly.

Most of the day the sport was dull, as, with the exception of one small covey and a few scattered birds which we got up along a drain, we found nothing. At several points tracks were seen in the snow, leading here and there, backward and forward, as they fed and followed each other in tortuous mazes, but the rabbit hunters, with which the country seemed well supplied, had driven them off to the bushy coverts. Nor was the pot-hunter altogether absent, as at one place we saw three or four farmers on horseback threading cornfields, searching for coveys to bring to the net.

Late in the afternoon, on a grassy plot, beyond a thicket of young trees, we found in the snow a maze of tracks, indicating a large covey. The scent was cold, but the tracks evidently made in the early morning. Tracing them some distance through some heavy swamp grass, they finally turned abruptly to the right, and led toward a cornfield on a hillside. In a fallen treetop, near the edge of the corn, Kate, who had been industriously nosing among the weeds, suddenly drew to a point. Dyke and Whit honored her challenge a second later. Two birds rose to M.'s flush, one of which he bagged, and W. the other. The treetop interposing, I failed of a shot. No other birds were found, but numerous tracks leading into the cornfield. As the scent was now warm, the dogs were sent forward to cut out the hunt. The field was almost crossed, when Dyke ran into and flushed a single bird, giving an ineffectual side shot through the standing corn. A moment later Whit anchored his stub tail on a point near a rail fence. At the rise M. dropped two birds and W. and I one each.

Most of the covey were further up, trailed by Dyke and Kate, but they took wing at our shot and went off to the woods. Noticing several tracks trending to the right, I took Kate and followed. They grew more numerous until a hundred yards away, Kate came to a point. I got near enough to put in one successful shot as a dozen birds rose over the corn and scudded away.

It was now near sunset, and abandoning the hunt we started homeward. As I crossed the fence near the thicket I heard a partridge whistling in a weed field to the right. Taking Dyke I hurried to the spot. The bird was evidently running, as Dyke would point, then go forward a dozen steps and point again. I ran into a flush and bagged it as it rose over the weeds. M. and W. had driven several into thicket. Marking them down I bagged two more before the others could get up.

The boys who brought the wagon out were now whooping to let us know they were at hand, so with twenty-two birds only we ended the day's sport.

That night, after cleaning our guns and partaking of a hot supper, M. entertained a group of villagers, before the glowing reflection of the office fire, by explaining the mysteries of his hammerless Greener, a novelty in that section, where muzzleloaders and hammer guns held sway, with few exceptions. No reflections, of course, were intended for my little Parker, whose working qualities and record stand unchallenged for perfection and execution.

Tom W., a beardless youth, whose stores of knowledge had recently received accession by a visit to the branch penitentiary at Eddyville, then constructing, contributed to the humor that flew fast around the circle, by numerous inquiries as to convict life at Frankfort. M. finally turned the laugh on Tom by assuring him that he should have a nice cell all to himself, the walls padded and a bed without springs on his next visit to Frankfort, and to make assurance doubly sure, that he would see the warden of the penitentiary immediately on his return in Tom's behalf.

Thursday we shaped out a hunt down the creek. Leaving Wingo early, a brisk walk of half an hour brought us to an opening near a cornfield. A ditch drain ran through the center and on its edge M. and W. flushed a small covey. One bird fell to M.'s share. The covey scattered on a hilltop in the edge of a thick piece of woods. Following, the party unitedly did some very ungraceful shooting among the trees and saplings on the second rise. The birds went further in the woods and we "left them alone in their glory."

A second covey flushed in some sedge grass on low ground, also went to the woods. With these we did better, bagging three or four birds and crippling one that fell among some dead leaves near a decayed log. Kate pointed it, and kicking it out it fluttered through the group and hid again so deftly it was several moments before it was discovered and captured.

In a thick piece of stubble we got up two coveys within 50yds. of each other. Here we had some excellent shooting, a dozen birds being bagged. I lost one, badly crippled, in a drift of logs and brush. Later on we killed half a dozen from a covey that scattered in a rough piece of oak woods. Under the shadow of an abrupt headland we got up a covey in a neck of meadow. M. did the flushing, getting a bird. Risking a long shot as they crossed the bottom I dropped a second at full 70yds. It was a chance at the bunch. On top of the hill we got two or three more in the heavy undergrowth, closing the day's count with twenty-seven.

Friday morning W. was unable to accompany us, and M.'s feet were so sore from the chafing of his heavy shoes he seemed indisposed to go out. As the weather was fine, M. was at last persuaded to risk his chances by a solemn pledge on my part to do most of the walking, and to drive the birds where he could shoot 'em easy. Dyke had behaved so badly by flushing unnecessarily, we concluded to leave him at home a second day all by himself. Kate had distinguished herself the previous day by attempting to walk on the sash of a glass flower-pit belonging to Tartt, leaving sundry jagged holes in the glass to show how easy it was to fail. So she was taken along.

Luck seemed to favor us at the start, as we found a nice covey shortly after entering the field. At the second rise, the dogs having driven it from cover, M. and I got two birds each, with a fifth to M.'s shot a second later. We marked down two in an open stubble, which we divided between us. The eighth bird fell to my gun along a deep gully. This was encouraging work in less than twenty minutes.

It was about the only interesting feature of the day, however, excepting a little incident in which M. displayed some marked adroitness. We were told a piece of corn land, having excellent cover, was posted only against tobacco trespassers and fishermen, and M., who has an adventurous turn, concluded to invade its sacred limits. I was not far behind. In five minutes we had up a covey, and the banging of our guns made music in the air. I was some thirty paces from M. when I noticed two natives pushing rapidly through the corn, heading for M. They had not seen me, though I was nearest. Stepping behind a dead tree I waited till they bagged M., and then, taking a short circuit, I mounted the fence in front on the skirmish line. The group were only a short distance away, and the first words I caught were M.'s vigorous praises of the virtues of a hammerless gun. The truth was, as soon as the farmers came up and notified M. of his trespass, with keen craft he diverted their attention to his hammerless gun, taking it to pieces and explaining its wonderful mechanism. They were filled with curiosity and surprise, and before five minutes were apologizing to M. for their apparent madness, while M. in turn extended them an invitation to come to Frankfort to see him. As he retired from the cornfield there was a twinkle in his eye that meant more than a volley for my taking post on the skirmish line. "Didn't I manage it nice?" said he; "all you have to do is to keep pullin' the trigger and she keeps a-shootin'," and his shoulders shook with laughter.

Saturday morning, the last day of our stay in hospitable Wingo, broke cloudy, warmer and foreboding rain. The quartette of dogs were loosened for the final tramp, M. exchanged his hard shoes for my rubbers, an excellent swap as it proved.

The Jersey wagon was engaged to take us out and come after us at sunset. Tumbling in, we drove several miles west of town, intending to hunt new territory. Our plans were slightly altered by Dyke, who was skirting the fields by the roadside, dropping to a point over the fence. Hastily dismounting, we put our guns together as Kate, Whit and Set drew a rigid circle about Dyke. Three birds were bagged, of which I was lucky enough to get two. Following them up down the hillside, we got two more on the second rise, and I afterward scored another on a cross-fire as it was darting for the woods. M. bagged a seventh before we quit the covey. Concluding to continue the hunt from this place, we ordered the wagon back. Going over the next hill into a brushy ravine, M. and W. took the bottom and I the top, keeping Kate in my front. She pointed a covey on a ridge, but owing to the trees, briers and saplings, I only got a single snap shot, bagging one bird. M. fired at one or two that crossed the bottom, but without success. A light, misty rain now began to fall which continued at intervals during the day. The snow had almost disappeared. Dyke seemed a new dog entirely. His two days' confinement had evidently revolutionized his notions of duty. He was strictly obedient to word and gesture, and never made a flush during the entire day. No doubt he had reasoned the matter over, solved the cause of his temporary retirement, and resolved to be a better dog in future.

Several fields were hunted over before another covey was put up. M. and W. were again in luck in getting the first shots. They bagged several, when the remainder were frightened to the bush by a wagon passing an adjacent road.

Descending into a long bottom M. flushed a covey in some heavy sedge grass, killing two birds at the rise. They scattered in a small patch of standing corn, where we brought several more to bag. Further up, I started a fine covey near their night's roost, dropping three plump fellows on the rise and winging another that fell over the fence. M. promised to watch the wounded bird, but taking his eyes off for an instant it disappeared and was lost. Most of this fine covey went to a wooded hillside, where we marked them down. Following a few scat-

tered birds up the valley, M. left us for a moment to hunt an adjacent weed field. He shortly stumbled on another covey that came driving over the fence, one or two going into a pile of rails and the balance scattering on the same hillside as the birds I started. W. and I routed a bird from the rail pile that flew toward M., a couple of hundred yards distant. Both of us pulled loose, and while the bird was missed the dropping of shot about M. evoked a volley of ejaculatory praises from him touching our eyesight in taking him for a bird. We warmly assured him we were only making trial to see how far our guns would carry. The explanation was totally unsatisfactory.

On the hillside, where the two coveys had settled, we had rare sport, bagging twelve or fifteen birds, though the shooting had to be quick and sharp, on account of the trees. W. made one or two splendid shots that gave promise of excellent skill in the future. This was his first bird hunt.

Kate, whose age and infirmities had secured several lifts over high fences, got on the wrong side of an 8ft. stake and rider just here, and appealed as usual for help. Thinking she would find a convenient hole to get through, we went on. This apparent neglect evidently gave her mortal offense, as she forthwith abandoned our company and made for Wingo. Or, drawing it milder, she may have heard the big dinner bell that rang out about that time and promptly gave attendance.

Our day's sport was continued till sunset and netted us forty birds, giving a total for the week of near 160. They had been kept by Tartt in his smokehouse, tied up in bunches of a dozen each. Packing them in our hunting chest, we left next morning for home, with pleasing remembrances of Wingo, of our hospitable host and his excellent wife, whose contributions to our comfort neither M. nor myself are likely to forget. No less kind were the attentions of W., who gave his services to our pleasure and constituted a most genial companion in our tramps. S. R. S.

Frankfort, Ky.

ESOC QUET.

DURING last spring I had frequently heard of a large hunting and fishing party, that was being organized for the purpose of visiting the far West. Upon investigation, the only information I received was, that they were going to Esoc Quet. I had not the least idea of ever becoming a member of the party, that was beyond my wildest hopes. I heard them talk about Indians and cowboys, blacktail deer and big trout, with a fair show of outward indifference. When it suddenly came to pass that I was to join them, my delight knew no bounds, for who does not envy a sportsman bound on a great hunting and fishing trip to the wild West. It hardly seemed possible that I was really to visit the boundless prairie, alas now almost destitute of game, to see the ranches and cowboys so well described by Roosevelt; Medora, the home of that famous ranchman the Marquis de Mores, and Custer, Big Horn and many other places made famous by the bloody Indian battle of only a few years ago. All the books I could find touching this country were immediately read with care and attention, Van Dyke's "Still-Hunter" particularly so; and no one going after blacktail deer can give this volume too much study.

Gen. Rodney C. Ward, of Brooklyn, N. Y., was the man at the helm when I was invited to join, and never did one work harder for the success of a trip and for the comfort of a party. He corresponded with very many people in the West, and most of the correspondence led him to believe that Esoc Quet was the desired spot. Big game and big trout were said to abound in that region, undisturbed by white hunters. Arrangements were made with a celebrated hunter to furnish us Indians and horses. Provisions, tents and supplies of all kinds were purchased in St. Paul and sent on ahead, so that on our arrival every thing should be in first-class order. Lieut. Abercrombie, of the U. S. A., who had surveyed the region, spoke in glowing terms of the country and promised to join us. Arrangements were also made to have that famous sportsman and surgeon, Dr. Merriam, U. S. A., with us to look after our physical welfare.

Our arrangements were all completed by the 1st of July. Arms and ammunition were purchased in sufficient quantities to kill all the game in America, and there was fishing tackle in proportion. (Bless that dealer who sent 10-gauge ammunition for the 12-gauge gun.) From that time until Aug. 25, the date of our departure, appeared to us a useless blank; and though we seemed to perform our accustomed duties in the usual manner, a close observer could have noticed that we carried our heads higher and seemed filled with an inner consciousness of superiority over ordinary fellow mortals not bound for the trackless forests to hunt grizzlies.

The evening of Aug. 25 found us at the Grand Central Depot. The magnificent private car Wanderer, well stocked with creature comforts and placed at our disposal by kind friends, was a scene of great confusion; boxes of guns, bundles of rods, cases of wine, baskets of fruit, valises and bags of all kinds, were piled in every room and corner. Outside were many friends bidding us farewell and giving us much valuable advice how to preserve our scalps from Indians and our bodies from bears. At last the gong sounds and we hustle aboard the train, which moves gently off on time. We begin to feel, as the General remarks, that we are going West. While the party are stowing away baggage and drawing lots for staterooms and berths, I will give the reader a list of the company. Gen. Rodney C. Ward, of Brooklyn, the father of the expedition and on all occasions a man of great weight with us, heads the list, followed by Judge H. A. Gildersleeve, Dr. C. W. Hoagland, Col. Wm. Hester, Baron F. Loesener, Messrs. Chauncy Marshall, Eugene Underhill, Murray Boocock, Geo. Marsters and Wakeman Holberton. Later we were joined by Lieut. Abercrombie and Dr. C. K. Merriam, both of the United States Army. Our creature comforts on the Wanderer were ably attended to by cook Brown, assisted by steward Patterson and head waiter Dan. How they managed to keep up the wonderful bill of fare they did, and where they kept their endless and varied supplies, will ever remain to us an unexplained mystery. With lots of books and vocal and instrumental music in the evening the time passed quickly. After leaving Chicago we were ordered to put off "boiled shirts" and substitute flannel; those who dared disobey were court martialed the following evening and promptly convicted and sentenced by the Judge.

We were treated with great courtesy by the officials of the Northern Pacific R. R. all along the route, and they did everything in their power to make the trip pleasant. While waiting for the train at St. Paul the general passenger agent, Chas. S. Fee, gave us a very pleasant drive through that beautiful city. We bought some bright-colored picture books for the Indians, and the red men were greatly pleased with them, particularly those containing the representations of animals; they never tired of talking about the great beast with two tails, as they described the elephant.

We left St. Paul in the evening, and awoke the next morning to find ourselves in the boundless prairie. Here the General remarked that he now felt without doubt we were going West.

To the majority of our party the country was entirely new. We did not know which most to admire, the wonderful scenery of the Bad Lands, with its curious and richly-colored formations, petrified trees and slowly smouldering seams of coal, the marvelous buttes of Montana, or the snow-clad Rockies. The people, too, attracted their share of attention. Cowboys, with broad-brimmed, leather-banded hats and jingling spurs; and Indians, real wild Indians, with gay blankets and blanket leggings, long, black, braided hair and vermillion-streaked faces. But when we saw the track walkers carrying Winchester rifles we began to feel that we were indeed going West very rapidly. At some of the stations we noticed vast piles of buffalo bones and skulls, collected from the prairie, brought in to be ground up for fertilizer. The prairies themselves appeared to be destitute of game, excepting in the ponds and sloughs, where our sight was gladdened by flocks of wildfowl, snipe and plover. Along the Yellowstone the scenery was superb. The Indian lodges with their bands of cayuses added to its wild beauty. The cayuse is an Indian pony descended from the wild stock and generally distinctly marked with white spots, some are entirely white and very handsome.

On the morning of the fifth day we found ourselves speeding along the magnificent Clarke's Fork. Great was our desire to stop the train and try the trout which they say are plentiful in this lovely river. The bright green waters rushed and boiled among the rocks or glided quickly along the white sand beach, where was unlimited room for back casts; beyond the giant cottonwood trees stood out in strong relief against the towering rocks which resembled ruined castles more than natural stone. But even now we are approaching our journey's end, Pend d'Oreille Lake (pronounced Pend de Ray), with its green waters and background of purple mountains glistens in the distance like an Alpine picture, and in a short time we are at Sand Point, Idaho, where our car is switched on a side track.

Here we put off our "store clothes" and emerge in what each individual considers the most appropriate dress for the woods. The result is bewildering. Instead of the sober dress of respectable citizens we present to the astonished Sand Pointers the appearance of a cross between a Wild West show and a circus. Fringed leather suits, corduroy suits, velveteen suits create a great sensation, judging from the expressions of the crowds of Indians and Sand Pointers who surround us.

Under the kind guidance of Mr. Murphy, a local angler and expert fly-fisherman, we manage to secure a boat and row over the lake to the nearest fishing ground. Our efforts are rewarded with considerable success and we make our first acquaintance with the new variety of the Salmo family. Great confusion seems to exist in this region in regard to the names of the fish and the grouse. The so-called mountain trout, cutthroat trout or speckled trout of these waters are magnificent fish; in Pend d'Oreille Lake we caught them weighing from ¼lb. to 1½lbs. They are called in the Government reports the black-spotted trout, and are, I believe, the young of the steel-head salmon. They spawn in the spring and commence quite young. As they grow in size and weight they drop down into larger waters until they reach the sea, where they are caught up to 30lbs. The female is colored very much like a bluefish, green on the back, with bright silver sides. They are spotted with black spots, very close together near the tail, and the dull orange dorsal and caudal fins are also profusely spotted with black. The male is very different in color and much darker, with olive back and sides, shading in bright carmine toward the belly, the spots are the same as on the female. I found that on this lake the jungle-ibis, Howard, jungle-cock, royal-coachman, jungle-Abbey and professor seemed to be the most taking flies; and the anglers here prefer the fluttering fly, size of hook No. 6 and 8. These trout take the fly in a peculiar manner, and I missed quite a number before I succeeded in hooking one. When they first rise they take the lure gently in their lips, then turn and swallow it as they go down, so that if the angler strikes before the fish turns, he invariably jerks the fly out of its mouth. They are exceedingly brave and fight more like black bass, making long runs and ending with a jump out of water. The flesh is pink, firm and delicious eating.

The following day proved so stormy that we decided to remain over in our comfortable car. Some tried the trout again, while others devoted their time to the grouse and wild fowl. It cleared off in the afternoon, affording superb views of the lake and mountains; the ever changing colors wrought by passing showers and gleams of bright sunshine are impossible to describe. The storm, we afterward heard, was very severe, particularly along the line of the railroad; seventeen bridges were washed away by a cloud-burst, and there was no communication with the East for five days. At last comes a clear day. We vacated the dear old Wanderer, and moved our plunder across the creek to where our guide was encamped with his men and horses. We expected to make an early start, but though the herder had gone for the horses at daylight, it was noon before he drove them into camp. They had been stampeded and were found nine miles off in the woods. Because of our needlessly large supply of baggage, we had to hire a squaw, who owned several horses, to help us out of our trouble. Mary proved to be a trump, and worked like a beaver. It was nearly two oclock before we started, and we made a long and interesting looking train, with our party on horseback leading, as we filed out of camp, down the banks of the Pend d'Oreille River, past the Indian lodges with their queer bark canoes and other belongings. It was six o'clock when we reached our first camping place. Of course it is impossible to camp with so many horses except where there is an abundance of grass and water. Fire is soon started, the horses turned loose and sleeping bags made ready. These sleeping bags, by the way, were quite an institution. The inner bag is of linen, then comes a bag of sheepskin dressed with the wool on, and over all a heavy canvas bag made to button up and inclose the whole thing like a mummy. They are warm and comfortable, and as rain poured all night and they were quite waterproof, they did good service, for unfortunately we had no tents. Matters looked pretty glum in the morning, and we were a damp, uncomfortable looking party, though we managed to get a cold bite and a cup of hot coffee.

As soon as the horses could be caught and saddled we were off; and lucky were those who were well provided with rubber clothing, for it rained the whole day, and the bushes through which we pushed our way as we followed the narrow blazed trail added more than their share of moisture. The trail led us through the roughest possible country, it could not have been worse and been practicable for horses; it led up and down slippery ravines, so steep that it was with great difficulty we could keep in our saddles, fording streams up to the horses' bellies, and slipping and sliding over wet rocks. It was a wonder that no one was injured; only one horse fell; but fortunately his rider escaped. We pushed on ahead of the pack train, hoping to reach the lake before night, but one of the party gave out so we stopped at a beautiful meadow through which ran a lovely trout stream. We were ahead of our pack train, and without any shelter but our sleeping bags; no axe and food. Dr. Merriam here proved what a good woodsman could do. With nothing but his hunting knife he succeeded in making a good lean-to, before which we soon had a roaring fire. He then fished out a loaf of very damp bread and a piece of raw bacon, so that we managed to make ourselves comparatively comfortable, though it was not quite up to the Wanderer.

I put my rod together and tried the brook in front of the camp, but caught only a very few small rainbow trout. Signs of deer and bear were plenty, and every bit of sand was tracked up by them. We slept by "fits and starts" that night, accompanied by the occasional yelp of a coyote or prolonged howl of a big wolf. At daylight I made my breakfast of a piece of lemon and a cracker. Then I cooked a couple of little trout and a bit of bacon on a stick to take along as a lunch, but thought better of it and ate it up at once. Away we go on the last stretch. The trail improves, the sun breaks through the sullen clouds and our spirits rise in proportion. One of our party left Sand Point with a bad cold and fully expected the rough treatment he received would bring him to an early grave, but to his great astonishment he found himself that morning completely cured, in fact none of us felt a bit the worse for our rough experience on that trip.

Toward noon our eyes were gladdened as we were riding through the dark forest by a glimpse of the silver sheen of the lake through the big trees. "Kunusku at last! Hurrah for Esoc Quet!" we shout, and as we ride out on the beach we see the welcome sight of white tents glistening three miles up the lake. In a short time we were at our camp, which was beautifully laid out on a white sand beach, 50ft. back from the water's edge. Half a dozen enormous pines shaded the tents and close behind them was the dense forest. At one end the Indians had their lodge and kitchen and at the other we had a very comfortable dining room built of cedar slabs and covered with a blue striped fly. A secure log house, just back of our tents, held the stores, and these with a bark kitchen for the cook completed the camp at Esoc Quet. This is the Siwash name of the locality and the meaning is the "Perfume of the Pines." The people in northwestern Idaho never use the word Indian, it is always Siwash. Fortunately our cook, Kiffy, and waiter Julius, soon followed us, and presently the appetizing smell of broiled venison penetrates our camp and we are gladdened by the "first square meal" since our departure from Sand Point. Our pack train did not arrive until the following afternoon. Such looking guns and such damp clothing. It took all the next day to get things into shape. The hot sun dried out the cartridges and blankets and a liberal use of "elbow grease" and Ferguson's rust preventer got the firearms into decent shape again.

Dr. Merriam was the first to try the deer. We left camp early in the morning with one of the Indians, crossed the lake, hunted over the hills on the opposite shore, near the mouth of Vermillion or Priest River, and returned that evening with the magnificent head of a black-tailed buck. He had a very laborious hunt and did not sight the deer until late in the afternoon; after following him some time, without being able to get near, he took a long shot at the game as it stopped to look back from a high ridge. By good shooting and good luck combined the first shot struck the huge deer between the eyes. The distance afterward paced was about 250yds. It was impossible to get the meat home that night, so they left a hat hanging over it to keep off the wolves and returned with the head and liver. The liver, when cooked with bacon, was equal to the finest calf's liver. As the doctor related his experience that evening by the campfire, while its light played fantastically on the branches of the tall pines that towered toward the bright stars overhead, we all felt fired with enthusiasm and wanted to kill a deer immediately. But before planning another hunt it was necessary to get the venison into camp. By daybreak three Indians, with two boats, started from the slumbering camp, and I volunteered to go with them. The air was sharp and cold as we pulled across the lake in our canvas boats, but it was warm enough when we began to climb the hills. We went along slowly and carefully, for the Indians said we might see a deer. The branches were dry and brittle and it required great caution to prevent making any noise. I imitated the Siwashes in the matter of dress, and left my coat and vest in the boat. On my feet I wore Indian moccasins, for heavy shoes are too noisy and slippery. Even our hats were in the way, and we soon stuck them under our belts. My Indian and I were some distance from the others when we heard four shots in quick succession. My Siwash whispered, "Him shoot deer." We saw plenty of fresh signs, and on meeting the other two men on the crest of the hill, learned that the chief had missed a deer at short range, though they believed it was slightly wounded by the last shot.

We soon found the big buck killed the day before; the Indians skilfully quartered him and adjusted their heavy loads with thongs cut from the hide. It was a hard pull up the steep hill (I could barely climb it with only my rifle), and they had to rest frequently before reaching the top. Then

we had a couple of miles to descend to the lake. Reaching the shore and leaving their heavy loads, the Siwashes took up the trail of the deer they had started in the morning; they followed the faint trail with great skill, much like setters following a bevy of quail and with the rapidity and stealthiness of a cat. After going perhaps a mile, I was startled by seeing a big blacktail deer jump up from the tall ferns and start off on a smart trot directly away. I threw up the Winchester and blazed away. On it went, turning into some thick bushes. I fired again, much as I would at a bird, aiming about a foot in front, and was gladdened by hearing the big beast go down with a crash. With a yell of triumph we dashed after it and my big hunting knife was plunged to the hilt in its throat; and I had killed my first blacktail.

While two of the Indians skin and break up the deer, the chief and I make a fire, and he lights a cigarette. My pipe and tobacco are in my coat pocket in the boat and I long for a smoke, so I make signs to indicate that I would like a cigarette also. The big chief nods his head and grunts, which I take to mean all right, and proceeds to roll one in the most approved manner. I am rather taken aback though, when, with what he considered a great compliment, he puts it in his mouth and lights it before handing it to me. I accept with the best grace possible, and, while I enjoy the smoke, make up my mind not to ask a Siwash again for a cigarette.

It was a wild and picturesque scene; the great dark forest with its big trees, the wild, bareheaded Indians, with sleeves rolled up and long hunting knives, cutting up the deer, while the big six-foot chief, with his long black braids hanging down each side of his face, squatted complacently before the fire enjoying his smoke. There was no doubt but that I was in the West. It was late in he afternoon before we reached camp, where I received the congratulations of the party; and a good supply of fine venison was assured for some days to come.

It is impossible in a short article to describe all the incidents or give all the particulars of our three weeks' stay on this beautiful lake. I can only state in a general way that we had superb weather and an abundance of trout and venison, varied occasionally by a few ruffed and spruce grouse. We had venison three times and trout twice a day while in camp. Some sportsmen think that the blacktail are not as good eating as the whitetail deer, but we could not find much difference. I want nothing better than roast saddle of blacktail deer and currant jelley.

The Indians, of whom we had five, belonging to the Kalespell tribe, were splendid hunters though indifferent shots, and we found them in every way trustworthy, truthful and reliable. Personally I prefer them to the majority of white professional hunters. They never lied about a miss nor indulged in profanity, and never spoke unless we asked them a question. I found them perfectly honest, which is more than we could say of some of the white gold hunters who hung about our camp. I was surprised to find the Indians so clean. They used soap and water freely, and brag about their superiority in that respect to the white man. The sweat-house is quite an institution with them, and they indulge very freely in this wild substitute of the Russian bath.

The only trouble we had on the whole trip was with one of our white guides, who got drunk one night, broke into our storehouse and opened fire on us with his Winchester. The Siwashes took to the woods and did not appear until the next morning. They dislike to get into a row with the whites or "Boston men" as they call them, for no matter how little they are to blame, they have to shoulder it all.

We were disappointed in one particular, we expected to find this region unvisited by white men, but the report had got abroad that there was gold in the land, and we found the country already overrun with prospectors. As these men live on the game, to say nothing of the blasting going on with giant powder, naturally the big game had left the lake shore and gone back into the mountains, making the hunting exceedingly difficult and packing the venison into camp a very serious matter. Only one of our party succeeded in killing a caribou, a fine fat cow with the horns still in the velvet. Our score for the trip was 23 blacktail and two whitetail deer and 1 caribou, besides grouse of three varieties, hares, ducks, beaver, coyotes and trout. We did not waste any game or fish; every bit killed was eaten or given away.

They call the spruce grouse fool-hens, and right well do they deserve the name, for their stupid tameness is beyond belief. The sharptail grouse, which they call prairie chickens, are said to be common near the beaver meadows, but we did not happen to see them. Of the famous Dolly Varden trout, which somewhat resembles our lake trout, we took very few, as they were spawning. The largest killed weighed 9lb. We tried them with all sorts of lures, but the mottled pearl bait seemed decidedly the favorite. The black spotted trout before described would take anything; spoons, phantom and fairy minnows, grasshoppers, venison and artificial flies, nothing came amiss. I was surprised to find these fish so very shy. The water of the lake was as clear as crystal, and one could see the big fellows cruising around in schools, but at the slightest movement of the boat, or motion of the rod, they were off like a flash. As they had never been fished for, I attribute their shyness to the fish-hawk (ospreys), which were daily seen fishing in the lake. They would drop into the water like a stone, often reappearing with a big trout struggling in their talons. Toward evening, just at sundown, superb sport could be had with the trout, when they came to the shallows to feed. I would let my boat drift along shore, and, when they rose within casting distance, dropped my flies over them, and rarely failed to hook one. When fast they seemed crazy with fright and rage. As the water was too shallow for them to dive or sulk, they would tear off with the line like a race horse, making it hiss as it cut through the water, while the reel buzzed like a rattlesnake. Several times I had trout that only weighed a couple of pounds (on the scale, not estimated) run off my line until I could see the spool, and I carried 40yds. on the reel. The rod I used on this trip was an eight-section bamboo, weighing 5oz., and about 9ft. 3in. long. So the angler can imagine the sport I had. I have killed hundreds of black bass and thousands of speckled trout on a fly-rod, but I never had fish to fight so hard or so long as these young salmon did. I suppose they could hardly be called grilse.

We found the following the best flies, and the list is a good one for any locality where the black spotted trout are found, viz.: General-Hooker, brown-hen, yellow-May, ginger-palmer, jungle-cock, jungle-Abbey, jungle-Montreal, jungle-ibis, jungle-professor, royal-coachman, great-dun, dusty-miller, beauty, grizzly-king and black-gnat. Hooks, 6 to 8 Sproat, excepting in the small streams where a No. 10 is better. The fluttering fly, properly manipulated on the still surface of the lake, I found to be very deadly, and those that used it had a big advantage. Sometimes, in the lake, these fish would rise to a bright-colored salmon fly.

These trout had the peculiar habit of almost always taking the upper or hand fly, and if they missed it once or twice, would get very much excited and jumping clean out of water, take the fly as they went down head first. The reader can imagine what a beautiful picture this made to the angler's eye, as they showed their bright colors and glistening sides for a moment in the air. During an evening's fishing, it was indeed rare to kill a fish under 1½lbs. and the chances were that many of them would turn the scales at 2lbs. and over.

A species of chub called the squaw fish was frequently caught on both fly and spoon; very good eating, though rather bony, and averaging about 2lbs. in weight.

We noticed the usual variety of wildfowl on the lake, but not in any great quantity. I saw no swans, and only one sandhill crane. The magpie, Idaho jay and raven were new birds to me. The pine squirrel, resembling in size and color our red squirrel, but much darker and with a tail almost black, was very common and rather a nuisance about the camp. They would climb the great pines and throw down the big solid cones by the dozen. These cones were full of nuts and weighed about a quarter of a pound each. It would have been no joke to be hit by one coming from that height. Bears we sometimes started, but owing to the dense underbrush we could not get a shot at them. Wolves, though quite common and often heard at night, are rarely seen.

Our head guide was quite a character, a New York gentleman by birth and education, who, after a romantic career, married a Kalespell squaw and settled down in Washington Territory, where he has a fine ranch and plenty of hunting.

Our return to Sand Point was better arranged than our trip out had been. We kept three or four pack horses and the cook right with us, so that at night we had our tents pitched and a comfortable time generally; besides, we were in much better trim and enjoyed roughing it.

At Sand Point we found large delegations from the Kalespell and Kootenai Indians, the latter a rich tribe from British Columbia. They were purchasing their winter supplies of flour, sugar, coffee, etc. They were a fine-looking lot of Indians, with long, black hair hanging in braids, gay-colored blankets and beeds, and faces colored with vermillion, and made a lasting impression on us "Boston men." It is to be regretted that Uncle Sam does not make it more difficult for them to obtain firewater. Their great weakness, however, is gambling. They spend days at their favorite game of "chelalak," not even stopping to sleep, and make night hideous with their monotonous tapping and howls. They stake anything and everything, even the clothing on their backs. I saw one buck in the street at Sand Point who had nothing on but an old black frock coat; a comical and startling object he was.

We tried the trout once more with good success in beautiful Pend d'Oreille, and then bade farewell to our wild tent life, reluctantly put away the comfortable garments of the woods, and returned to the stiff "boiled shirts" and hideous clothing of civilization.

THE MANATEES.

BY R. W. SHUFELDT, M.D., C.M.Z.S., U. S. ARMY.

Corresponding Member of the Academy of Sciences of Chicago, etc.

HAVING dealt with the Armadilloes in my last contribution, they being the representatives, as we remember, of the Suborder Loricata of the Order Edentata, we now arrive in this Provisional List of the Mammals, as authoritatively arranged by the U. S. National Museum, at another very distinct order of animals, known to zoölogists as the

ORDER STRENIA. SEA-COWS.

Family TRICHECHIDÆ. *The Manatees.*

Trichechus manatus, Linné. South American Manatee.
Trichechus latirostris (Harlan), True. Florida Manatee.

My personal knowledge of the Manatees is principally based upon having carefully studied the skeletons and other material afforded by the Museums, and having seen a live one once on the west coast of Florida, and another, some twenty-seven or eight years ago, about half a mile up the Coatzacoalcos River on the Isthmus of Tehuantepec, southern Mexico. This last one I saw from the deck of a steamer, and I remember very well that it was in shallow water, and that it had drawn itself partly out on the muddy ooze of the bank, so that its form was very fairly exposed to my view.

Nevertheless I am quite familiar with this Order of mammals, and it will be my aim in the present article to review some of the more important parts of the history of them so far as it is at present known to naturalists.

Geology goes to show that the early Pliocene and Miocene seas of Europe swarmed with several species of animals, which zoölogists have good reason to believe were the latter extinct ancestors of existing Sirenians (*Halitherium*). But the intermediate forms which connected our living types, such as the Manatee, with the ancient ones, to which I refer, have not as yet been discovered. Zoölogists have also held, and I think it is very probable too, that the Manatees and their kind are in some way related links, remotely affined to the Cetaceans on the one hand, and the Ungulata on the other; but even of this kinship the evidence is as yet not satisfactorily demonstrated. Various other extinct sirenian species have received different names at the hands of paleontologists, but it is not our object to further pursue this part of the subject here; one form, however, recently exterminated, fully deserves a word of passing notice, and I have reference of course to the Northern Sea-cow (*Rhytina stelleri*). Of it, Professor Flower has said, "Only one species of this genus is known, *R. stelleri*, the Northern Sea-cow, by far the largest animal of the order, attaining the length of 20 to 25ft. It was formerly an inhabitant of the shores of two small islands in the north Pacific, Behring's and the adjacent Copper Island, on the former of which it was discovered by the ill-fated navigator whose name the island bears, when, with his accomplished companion, the German naturalist Steller, he was wrecked upon it in 1741. Twenty-seven years afterward (1768), as is commonly supposed, the last of the race was killed, and its very existence would have been unknown to science but for the interesting account of its anatomy and habits left by Steller, and the few more or less perfect skeletons which have recently rewarded the researches carried on in the frozen soil of the islands around which it dwelt. There is no evidence at present of its having inhabited any other coasts than those of the islands just named, though it can hardly be supposed that its range was always so restricted. When first discovered it was extremely numerous in the shallow bays round Behring's Island, finding abundant nutriment in the large laminariæ growing in the sea. Its extirpation is entirely due to the Russian hunters and traders who followed upon the tract of the explorers, and who, upon Steller's suggestion, lived upon the flesh of the great Sea-cows. Its restricted distribution, large size, inactive habits, fearlessness of man, and even its affectionate disposition toward its own kind when wounded or in distress, all contributed to accelerate its final extinction."

Professor Nordenskjöld has claimed and in the writer's opinion upon too insufficient evidence, that living specimens of this sirenian were known to exist in the locality above referred to as late as the year 1854. This matter has been more carefully examined into by Dr. Stejneger, who it would seem has very successfully refuted this erroneous notion.

We now pass to the existing types of these interesting animals, and find that there are but two genera of them, viz.: *Halicore* and *Manatus*, the first contains the famous Dugongs, sirenians very distinct in their structure from our Manatees, but as they are denizens of "the shallow bays and creeks of the Red Sea, east coast of Africa, Ceylon, islands of the bay of Bengal and the Indo-Malayan Archipelago, ranging from Barrow Reefs on the west to Moreton Bay on the east," they cannot properly claim our time and space here, as interesting as they are in many particulars. Even our own Manatee has a closely related African cousin (*M. senegalensis*), and of which form I have given a view of the skull in the present paper (A), as I had not one of the American ones at my hand.

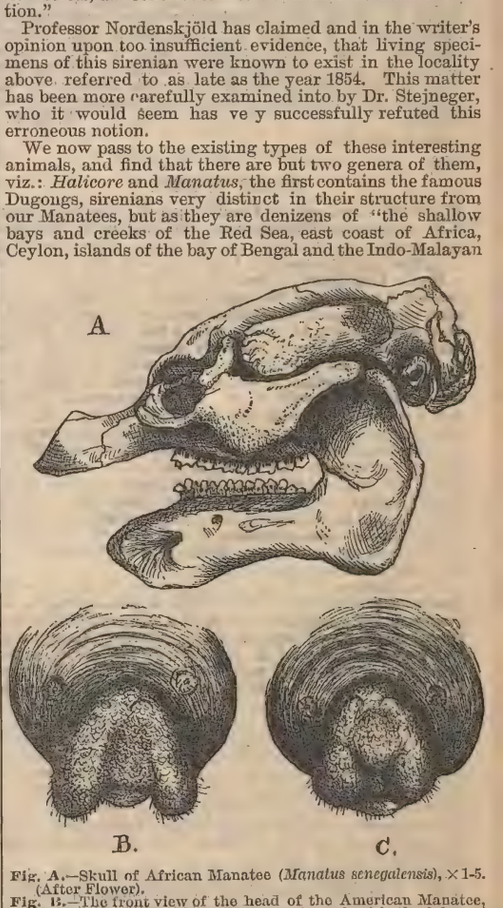

Fig. A.—Skull of African Manatee (*Manatus senegalensis*), ×1-5. (After Flower).
Fig. B.—The front view of the head of the American Manatee, showing the eyes, nostrils and mouth, and with the lobes of the upper lip divaricated.
Fig. C.—The same, with the lip contracted. (After Flower, from Murie.) These figures all copied by the present writer.

As will be seen by the classification in my leading paragraph above, there are two species of American Manatees, but only one of these belong to our United States fauna, the Florida Manatee, a form that so far as this country is concerned, is now confined to the coasts of the peninsula from which it takes its name. Owing to the fact that most of the specimens of Manatees that have reached Europe are the South American animals, and further, as it was very natural that they should figure that form in the "Transactions," this will account for my presenting here a group of those animals in lieu of our own species; however, when reduced to this small size they would be hardly distinguishable in the drawing which illustrates the present paper.

Manatees are enabled to use the paddles formed by their forearms with considerable facility, and this is undoubtedly the way in which they originally came by their name, it being derived from the Latin word for hand. *Manatus*, moreover, is the technical name applied by some zoölogists to the genus that has been created to contain them. According to True, Mr. W. A. Conklin, director of the Central Park menagerie, in New York city, gives the following dimensions of a specimen kept alive in that establishment in 1873, these being the only reliable measurements of a Florida Manatee, under its proper name, on record: "Length, 6 ft. 9½ in.; circumference around the body, 4 ft. 9 in.; length of flipper, 1 ft.; width of same, 4½ in.; width of tail joining body, 1 ft. 6¾ in.; greatest width of tail, 1 ft. 8½ in.; weight, 450 lbs." It is very likely, however, that the animal may attain to a length of at least 8 or 9 ft., as trustworthy authorities so state, in which case they would come to weigh something between five and six hundred pounds.

My figures so thoroughly portray the general form of the Manatee, that it hardly seems necessary to enter upon any very extended description in this place; we are to especially note, however, the fish-like form of the body, terminating behind in the broad, somewhat rounded and horizontal tail; the constricted neck connecting this body with a rather small, oblong head; the complete absence of hind limbs, with the fingerless paddlelike forelimbs, the latter tipped on either side with three small nails; the total absence of all fins; the wonderful minute eyes and ears, the latter being without any external pinna; the great tumid upper lips overarching rather a large mouth, the former having a sparse growth of stiff bristles growing upon them; the wrinkled skin, which is of rather a deep gray color, and having a few scattered hairs growing over it in some specimens, more especially in the younger individuals. But of all the external characters of a Manatee none are so noteworthy as the fleshy pads, one on either side, that go to form the extraordinary upper lip.

GROUP OF SOUTH AMERICAN MANATEES.

Adapted from a drawing by Henry W. Elliott from the "Transactions of the Zoölogical Society of London," by Dr. R. W. Shufeldt, U. S. Army.

Professor Garrod in alluding to these says of them that, "These pads have the power of transversely approaching towards and receding from one another simultaneously (see figs. B & C). When the animal is on the point of seizing (say) a leaf of lettuce, the pads are diverged transversely in such a way as to make a median gap of considerable breadth. Directly the leaf is within the grasp the lip-pads are approximated, the leaf is firmly seized between their contiguous bristly surfaces, and then drawn inward by a backward movement of the lower margin of the lip as a whole."

It is said that Manatees have the power of carrying their young about within the grasp of their forelimb or limbs, and that their appearance at these times has given rise to the fabulous mermaid of nursery tale renown, but so far as the writer is concerned, if these mythical maids of the sea, which so often filled my dream-head in boyish days, or my fanciful reveries of perhaps riper years, bore any resemblance to the beauty that sits up on the tip of her tail in the group herewith presented, I beg to be excused an introduction, and, well, perish the thought in a mind thus so rudely disappointed, I fain would remark, "Not for Joseph." Certain it is, however, that these animals can make considerable use of these paddles of theirs, for with them they assist in tucking their food into their mouths, and in moving about on the bottom of the river or lagoon where they may be feeding, they use them in conjunction with the tail, in assisting their locomotory acts.

Manatees avoid getting into the open see, but habitually resort to the shallower waters of rivers, bays and lagoons, where they move sluggishly about on the bottom, browsing much in the same way that the terrestrial herbivora do upon land, their food consisting exclusively of the aquatic plants which so abundantly grow in such situations. In quiet weather, they sometimes seem to enjoy getting into deeper water, where by the assistance of their lungs, they are permitted to float at the surface, which they do arching their body in a peculiar manner. Indeed, their lungs seem to act very much in the same manner as the swim-bladder of fishes is known to operate, and while Manatees are feeding they may be seen to rise every few minutes to the surface to breathe, but instances of their getting completely out on the land remain yet to be proven, and when placed there, their acts are in the extreme most awkward. So far as their senses are concerned, these creatures have fair eyesight, acute powers of hearing, and the other powers probably well developed. They are not known to be possessed of the ability of emitting any voice-sound. They seem to bear captivity well, and living specimens have been studied with great interest and advantage at the Zoölogical Gardens of London, where they have been successively kept. In behavior, they always seem to be gentle and inoffensive, exhibiting on all occasions great concern and affection for their young. Indeed, man has proven to be their greatest enemy, and they are forever pursued and captured for their flesh and skin and the oil which they yield. Thus it is that Manatees are on the road to extinction, which, everything considered, in time is sure to come about. The methods of capturing the Manatee are many; (1) they may be shot as they rise to the surface to breathe, an operation that requires great skill and quickness; (2) they are taken in some localities by means of an ingenious kind of net; (3) finally, they are captured by the various modes of spearing and the use of the harpoon.

So far as the breeding habits of the Manatee is concerned, but little or nothing is known; the best authorities have it that the period of gestation lasts eleven months, and the young follow their mother about for six months or perhaps longer. It is a well known fact, of course, that the dam suckles her young at her breasts, there being two mammæ, which are post-axillary in position.

In concluding, it gives me pleasure to state that in my account of this animal, I have been much assisted through my perusal of True's history of it in that admirable work, recently published by the United States Commission of Fish and Fisheries, entitled "The Fisheries and Fishery Industries of the United States." Mr. True in closing his article in that work, says, "In the Manatee, then, we have an animal of great size, of gentle disposition and apparently of rapid growth, which lives in places readily accessible to man, and is easily captured, and which furnishes meat which is not inferior, oil which is remarkably fine, and leather which possesses great toughness. From these considerations it would seem evident that, with the proper protection, it would furnish no small revenue to the people in those portions of our country which it inhabits, for centuries to come." (p. 128).

Finally, to those interested in the progress of science in Florida, I should say that we have not as yet by any means a complete history of this animal, and accurate reports upon the following subjects are very much to be desired: (1), an accurate observation giving all the circumstances of a Manatee voluntarily coming ashore to feed or for any other purpose; (2), the manner of coition, the period of gestation, the mode of delivery, the number of calves at a birth, how the latter are suckled, their size and appearance, and how long they remain with their dam, and a great deal of their structure and anatomy, are all subjects almost unknown to us.

The Massachusetts Fish and Game Protective Association gathered together its members for the first time this autumn on Tuesday, Oct. 11, and by general consent the meeting was pronounced a decided success. Fifty members and their friends, among whom was Mr. A. G. Faye, Jr., editor of the new Boston sporting journal, *Judge and Jury*, as a special guest of the association, sat at the tables of the Tremont House. It being the first meeting since June there was very little business to be transacted; the only new members were H. M. Daggett, Jr., and W. M. Bunting, and the major portion of the evening was given up to social chat. President Samuels first called upon Mr. Walter M. Brackett, who gave an account of salmon fishing in Canada, and following him Mr. Samuels gave some very entertaining and amusing reports of his own experiences in Cape Breton, where he had spent the summer months. Mr. Faye gave a very practical talk upon methods for furthering proper protection of game, and suggested that the association should extend its correspondence and make affiliation with all sporting clubs in the State, both for the good of all and for its own interests, especially in forwarding the good work.—Hub.

Game Bag and Gun.

Address all communications to the Forest and Stream Pub. Co.

AN OCTOBER BAG.

ON the afternoon of October 31, 1883, I started up into the country for a fortnight's shooting, and reached my destination, the residence of my cousin Jim, an ardent sportsman, just in time for supper. We discussed the game prospects, which were finally decided to be quite favorable, taking into consideration the comparatively short distance from the city to the ground over which we were to shoot. We then loaded shells until bedtime. On awakening in the morning I heard the clear *ha-onk, ha-onk* of wild geese on their way to a small lake a few miles away. Was down and out in short order, although in the east were only seen the first faint tinges of dawn, and the moon had just gone down behind the western trees. I let loose the setters, Dash and Tillie, and we three took a short walk down the road, and upon returning found the household aroused. A pair of beagles were to be brought along in the rear, in charge of a boy, to be used on rabbits.

After breakfast we started, Jim H., Tom J. and the writer, and came to a big brown buckwheat stubble, bounded on two sides by bog meadows, thickly grown with rank weeds—a favorite roosting place; on another by a dense thicket, and on the remaining side principally by three sportsmen, two breechloaders, a muzzleloader and two English setters, with the boy, Kaiser, and the beagles in reserve. The dogs were waved on, quartered the field over, and in the corner toward the bogs Dash suddenly caught on and pointed handsomely, Tillie backing. We stood still contemplating the scene for some few moments, it being the first point of the season, and I noticed that my hands were trembling with buck fever in a mild form. We moved up, Tillie leading the way until even with Dash, who jealously took a couple of quick steps in, when with a rush up whirred a good-sized bevy of full-grown birds, fifteen or eighteen in all, and notwithstanding the care we had taken to keep between them and the thicket before mentioned, six or seven rose over our heads and made for it, the majority of the bevy, however, going into the bogs. Jim and I paid our respects to those going for the brush, Jim getting a double, while my bird, struck in the brain, started for a hole in the clouds about five miles up, when I got in the left and he stopped. Tom had added the two reports of his Scotch muzzleloader to the general hubbub, blanking with both and was wondering how it happened. In justice to Master Tom, I must say it was his first and up to the present time last attempt at wing shooting, and I afterward learned that he disposed of his gun and accoutrements the following week at a raffle.

After the dogs retrieved we started into the bogs, and then the battery opened, and in a short time we added eight more quail to our bag, three birds getting back to the thicket. We started in, but got only one more bird out of that bevy, the brush being too heavy. Further on we started a cottontail in some briers along the edge of a large swamp, so, calling in the boy who took charge of the setters, the beagles were put on the track (being with us on Tom's account), and Tom was stationed on a bridge into the stonework of which the rabbits were accustomed to run. We were now in a position to salute "Brer Rabbit" upon sight without grace. The hounds' merry music was awakening the echoes, Jim occasionally catching a glimps of the dogs as they pushed the rabbit along the swamp's edge.

Suddenly he called out to me that he had seen the beagles flush a woodcock, so leaving Tom to guard the bridge we started in. Jim had marked him down in a long, narrow and very dense thicket; so, without dogs, Jim walked along one side and I along the other, expecting the bird to get out wild, which he did. I heard the flap of his wings, called Mark, and as he topped the brush about 25 or 30yds. ahead pulled, and was very much surprised at the cloud of feathers which drifted away at the loud report of my gun, the shell being loaded with wood powder. "I've got him," I called out; "So have I," came the answer. We had both got him, and as Jim remarked after we picked him up and inspected him, "it saved one the bother of picking." He certainly did look rather bald. Just then a shot from Tom announced that he had seen bunny, and a prolonged shout that he had stopped him. The beagles came up and were taken care of by Kaiser, who turned the setters over to us again.

We went along for some time through a swampy piece of woods, with thick underbrush in places; the dogs were ranging rather more freely than the nature of the cover warranted, when, through an opening I saw Tillie stop and draw off to one side as though she had winded something. I hurried up, but out from a big pin oak some 30yds. away, boomed an old cock partridge which I reached for with the left barrel; got a number of feathers as a memento and Jim's sarcastic comment, "That it was all right to pick them but not to do it for some one else's benefit," (and some rabbit hunters found the bird dead in a field just outside the edge of the woods.) I have worried about that bird ever since, and generally look up very closely any birds which leave feathers behind. We put up and knocked down six woodcock in a big patch of alders further on, and by the look of the droppings and borings there had been a great many more there only a short time previous. We now crossed over into a large brush lot, where we expected to find some more quail. I presently walked right into them, killed the old cock, which rose high, the rest going off low through the brush. On looking around, I saw Tillie at a charge; she had doubtless been pointing when I stumbled upon the bevy. It was almost impossible to shoot the birds in that place, our object was to drive them out. At my call of Mark! Jim had jumped upon a stump and saw the birds leave the lot, some alighting in a field of high weeds while the rest kept on to a bog meadow. We crashed along through the brush in their direction, and a woodcock got up some distance ahead of Jim; I caught a sight of him but too far away. He went in much the same direction as the quail, a little off to one side in a clump of white birches.

As we came out into the weed field we saw the quail which had lit in the weeds and run together, rise and go on to the dogs, so that we now had the whole bevy in them. Jim now declared his intention of having that woodcock, which was an unusually large one. I kept on for the bogs, on the edge of which Dash pointed, the bird rose, and at the report, slanted down into the bog grass, wing-tipped, and although we tried for some time to work him up, failed to find. Finally gave it up disgusted, as it is a great shame to wing or wound a bird severely and have him get away and become food for vermin. Just then I heard "snap, bang, bang, bang;" and glancing quickly around at Jim's cry of "Mark," I saw the woodcock crossing behind me at 30 or 40yds. distance, and as Jim said afterward, and it seemed to me at the time, "he looked as big as a hen." But he shrank considerably before he came to bag, which was not to my gun, for, as Mr. Peggotty says, "I'll be corned" if I didn't pull both barrels and never moved him; that capped the climax. I told Jim about where I had marked him down and he went on alone. I sat down meanwhile to get into a better state of mind, as it always made me angry to miss such an open shot. I thought the matter over; it must must have been the fault of the shells, which, from knocking around in my pocket, had lost the shot. I finally decided it must be so and began to feel better. Tom now came up and we sat on a stone fence waiting for Jim to come, when we all intended to get square on the quail in the bogs. Tom now told me that he had flushed the woodcock and had a beautiful shot, but his first barrel missed fire, and he had a very easy shot at a rabbit which jumped out in the bush lot, but had another misfire, and for the balance of the day he had misfire after misfire with that right barrel, although he picked the nipple clear, and re-primed it with fresh powder, and snapped his cap regularly at every opportunity.

Jim got a point on the woodcock which had gone back to the brush lot; the bird jumped up, got tangled in the heavy brush, and Jim cut the top of his head off with a snap. He had now joined us, and we were just about to charge into the bogs, when I heard the sharp yelping of the beagles out in the meadow, and out came the whole bevy (which we had marked in and which had run together) like sparks from an anvil; Jim killed an incomer, I got a long left quarterer, and the game was up. We found that Kaiser, not having heard anything of us, had for his own amusement let the beagles loose, in consequence of which we lost that bevy, as they were scattered to the four corners of the earth.

We had engaged to be back by three o'clock, so started, coupling the setters and letting the beagles run, and on the way home, over much the same ground, picked up a brace of partridges, a gray squirrel and a number of rabbits, which Mr. Kaiser had to carry as a "reward of merit." Reached home in time, and upon examining Tom's gun, found the right barrel to be empty. He had omitted to reload it, and had put a cap on, thinking it already loaded. This ended one of the most pleasant days I ever had. Every fall since, Jim and I have been afield together (Tom having renounced hunting as a delusion and a snare) and expect to have some good times the coming season. Jim and myself hope it is not too late to express jointly our sincere thanks for a kindness rendered us by your valuable paper. We wrote you some time ago in regard to a case of dog sickness, and your prescription effected a complete cure. RAGWORT.

IN THE SAWTOOTH RANGE.—IV.

MONDAY we took horses to pack our deer in, and had quite a time on account of the steep hill and fallen timber, getting down at last to the trail, where we left my buck with one horse until we should return with Charles's deer, which was on the same trail only a good deal further. On our way we met a party of prospectors, the first people we had seen in three weeks; they promised to visit our camp the next morning. Getting to Charles's deer, which was still larger, but lying in such an impassable wilderness we only took the hind parts, but as the antlers were so large and beautiful I packed out the head for preservation. We were a long way from camp, the trail, through miry meadows and marshy bottoms, was a dangerous one for our horses, and we felt very glad when we caught sight of our cheery camp-fire. The next day we rested, as we had been traveling or hunting since we started. Our prospectors paid us a visit; we told them the latest news we knew, and received directions and information of our further route. According to their description the country they were coming from must be a perfect hunters' paradise, deer, elk and moose abundant, and not hunted; so tame that they killed almost all their meat from their cabin door; no trapper ever visited there; on one stream they counted one hundred beaver dams, besides plenty of martins, foxes, fishers and wolves and other varmints. They were leaving the country for fear of being snowed in, and knowing the dangers they warned us that to enter it now would be a desperate, mad and daring adventure.

Commenting on our horses and outfit, they noticed a rather striking pack saddle, which I had shipped with the rest from the East, but which had ruined every horse's back; I offered to exchange it for one of theirs, and both sides felt satisfied with the bargain. I had my eye on a fine-looking dog in their outfit, and after a little persuasion, and a sociable smile, we secured Pedro for a small consideration.

Wednesday the 19th we were early in the saddle, going five miles above where we had built the bridge to follow the elk. Picketing our horses in a suitable spot, we hunted faithfully but in vain for elk or bear. A singular incident happened to me that day. Hunting back in the afternoon toward our horses I jumped a buck with large, tempting antlers, giving me a fair but running shot. At the crack of the rifle the buck dropped. Pedro, our lately acquired dog, was with me, and at my command went bounding to the deer, which got up again, and with Pedro in close pursuit, soon out of sight. I expected the powerful dog would soon catch the wounded deer, but Charles, attracted by my shot, told me that Pedro was running far down the river. We looked for blood, but not a single drop could we detect, neither where he fell nor in his tracks. I must have creased, or, the bullet striking his antlers, knocked him down, paralyzing him for an instant. Getting back to the horses we made for camp, Charles going ahead, while I helped Bill take up his traps, he had caught some foxes but no beaver; a trapper who shortly preceded us had cleaned them out.

Thursday we packed and struck for Deadwood. Made it next day by noon in a drizzling rain. This fitly named town consisted of half a dozen deserted log shanties, which we took possession of; putting our camp duffle in one, cooking in another, and sleeping in a third.

Half a mile down we found an old pioneer, who kept a few supplies; he owned a placer claim, but being without sufficient water had some men engaged digging a ditch, leading Deer Creek with its plentiful watershed to his claim. He told us the town sprung up in 1867 and had quite a boom, the population increasing to 150 men, but all had deserted when the next excitement was boomed.

We moved our camp next day down to the Payette River, where we were told of beaver, but they were trapped out, or had become too wise for us. Billy noticed considerable sign up the river, and concluded to leave us for a few days, to find out. Giving him a few cooking utensils and grub, and telling him that we would keep on the trail to Garden Valley, he started up the river, while we went in the opposite direction, and camped at night at the foot of the divide. In the morning our horses had a hard time to get down; the descent was so rough and steep that the packs kept slipping forward. At last we got down to Onion Valley and camped.

After setting our tent and a cold lunch, we took a stroll through the small valley, and found camped not far below us an old packer, with his mule team. He was taking his midday meal, and being invited to join him we took a cup of coffee, hot bread, and fresh butter, a luxury we had no tasted since our start.

In the morning Charles and I went in different directions, but did not see any game, though plenty of sign that indicated bears been feasting on the wild ripe rosebuds. That night at supper time Billy made his appearance, he had again been disappointed and hurried on after us.

Thursday we pulled out early and had to cross Lightning ridge, the meanest trail we had traveled, sometimes up large smooth and slippery rock, actually pushing the horses which could get no footing, or through narrowly hewn paths, where they had to perform goat acts of jumping, climbing and sliding. It was specially rough on the pack horses, but at last we overcame the worst and came to some springs, but not finding feed for horses here we pushed on to the foot of the Garden Valley amid a lively snow flurry, thanking Providence it did not snow in the morning, for this would have made it impossible to cross the divide. We quickly set our tent on the creek near the river, and no sooner had it up with our things inside than the snow changed into pouring rain, which lasted all night.

In the morning the mountains around us were covered with a deep mantle of snow. Billy straightened things out in camp while we went out to reconnoiter. A mile below camp we found a well-kept and well-stocked ranch and in the owner (Mr. Pinney) a sociable and hospitable gentleman. Telling him from where we came and what we were after he advised us to stay; to turn our horses, which needed rest, in his pasture. In regards to game he spoke very favorably, but recommended us to see and get acquainted with D. Bunch, the "boss hunter of Idaho."

The next day Charles and I rode down through the beautiful and well settled Garden Valley to find this mighty hunter, stopping at the post office to mail some letters. Mr. Mills, the postmaster, who keeps a kind of road house and a store of all trades, sent his son along as guide to Bunch's, who lived at the lower end and a few miles up on the south fork of the Fayette. We met him on his way to the river, where he was hauling lumber for his new house. We soon imparted to him the nature of our visit; he was sorry not to be able to go along with us, having to finish his house, but willing to give us good advice and information. After a longer chat and a little more persuasion, his hunter's blood got up, and he promised that if we would come up to his place with our outfit he would manage to go three or four days with us. Highly pleased with our success, we thanked him, and promised to be on hand. It was dark when we returned to Pinney's ranch on the upper end of the valley. We left our horses in his pasture, and as our camp was on the other side of the river, we had to use a foot log, shinning it across, and feeling greatly relieved reaching again *terra firma*. In the morning we packed up and moved down the valley in a pouring rain. At the post office we met Bunch's oldest boy, Lee, and Alex. Carpentier, a neighboring chum; and, after purchasing a few needed supplies, they piloted us to the hunter's cabin. We did not set our tent, but slept in the cabin. It was well we did, for it rained great guns all night.

Next morning it cleared, and after breakfast we assorted our camp duffle, leaving all unnecessary truck, antlers, skins, etc., and in the afternoon started for Bunch's old hunting grounds, following the fork up until we came to a high, steep mountain, which we climbed, tacking down the other side, equally as steep, and camping at the base on Big Creek. Next morning we started out in pairs; Mr. Bunch and the scribe for the higher ridges in quest of elk or bear, Lee Bunch and Charles, while Alex. Carpentier took Billy in tow. We ran across several deer, but our object was larger game; we knew the boys would kill some venison in a better locality for packing out, and we soon heard them turn loose. Reaching the top of a high overlooking mountain, commanding a magnificent and extended view, we sat down to watch. Bunch soon saw a black bear on the next ridge, bending down the bushes, and feasting on the ripe berries. We sneaked down and got within 200yds. unnoticed by him, when both of us fired together. One of the bullets must have struck him; he turned to run for the next gulch, when Bunch stopped him again; he was the most nonplussed bear I ever saw; he changed his course and came straight for us; then discovering his mistake stopped, giving me a splendid shot. This bullet finished him; he fell and rolled near the creek. It was a large bear, with beautiful glossy fur, and very fat. Though we noticed plenty of fresh sign, we saw no more bears that day. Reaching camp by sundown we compared notes. Lee had killed a nice doe and wounded a buck. Charles had hung up a buck and a doe, Billy had killed a doe, but Felix had not run on anything.

In this splendid game locality we hunted for a week with various results, Lee succeeded in killing a large cinnamon bear; the rest of us brought in several deer, and a great many grouse. One day when Bunch, Felix and I were coming home from an unsuccessful drive, hunting along an extended sidling mountain, Bunch on the top kept rolling down large rocks and boulders, thorugh the intervening thickly grown gulches, Felix being at the base of the mountain, while I kept between the two, on the side. Bunch kept sending down perfect avalanches of rocks and logs, but nothing showed itself. We had come

together after exploring the last gulch and were blaming our luck, when Bunch suddenly exclaimed, "There goes a bear up the ridge." He was too far to shoot, so we watched him. Aroused by some of Bunch's missiles, he evidently felt very uneasy, sometimes getting into a clump of brush, but never remaining long, now he came near, or into Bunch's former tracks, which he feared to cross. We watched his capers with great interest, when at last Felix suggested to try to scare him with my rifle at long range. Turning my Lyman sight to the highest notch I lay down and blazed away. The first two shots went low, Bunch through the glass seeing them strike. Holding a little higher my fifth shot must have hit him, for he jumped very suddenly from a burnt log, and limped toward the nearest thicket. We did not go after him, it was getting dark and we were a long way from camp; besides we thought him only slightly wounded. But this proved different to my greatest surprise, when a week later, hunting grouse one morning on the ridge, where I had seen him disappear, the dog found him dead. When Bunch, Felix and I reached camp, we found that the other boys had returned from the Deadwood fork, where they had spent a few days after elk. They reported plenty of sign, but the warm spell had driven the game back to their mountain fastnesses. Mr. Bunch and Felix pulled out for home the next day.

Charles, Billy, Lee and myself, with some horses soon had the deer in camp, and the following day leaving tents and camp outfit, we started, loaded down with venison, for Bunch's house. Monday Lee and I went to Placerville, where he found a ready market for his venison, while I replenished our supplies.

The boys decided to build a good cabin and smokehouse at our last hunting grounds, to spend the rest of the winter in hunting and trapping in that vicinity. We all pitched in and helped carry lumber from the river to finish Bunch's house. Charles, Billy and I, loaded down with saws, axes, and other building tools, went back to the old camp, the boys to begin to build their cabin, and I to hunt and supply them with meat. I killed few deer but principally practiced on grouse, shooting their heads off with my rifle. One morning I went out early with my shotgun after a mess of grouse to take down to Bunch's next day, I went along the ridge, but became pretty near lost. My gamebag, a gunnysack tied knapsack fashion, well filled with grouse on my back, weighed me down considerably and darkness overtook me before I knew it. Trying a short cut across some ridges to the main ridge, which led to camp, I became puzzled, and as it was pitch dark, I was completely turned around. I fired my gun and listened for an answer, which came, I thought from the wrong direction. Climbing and groping my way up a steep hill, I shot again, when I heard a faint answer in a different direction. At last after several more shots, Billy came up to me relieving me of my load, and soon we saw the bright welcome campfire. I was hungry and pegged out. The boys had waited supper for me, which never tasted better in my life, and after a consoling pipe, I was soon comfortably hidden in my sleeping bag. F. B.

AN ARKANSAS OUTING.

HAVING just returned from a two weeks' trip in the wilds of Arkansas, I encroach upon your space, not to herald my wonderful exploits, but to present a few suggestions which may be of service to others in visiting that country in pursuit of game. That there is a variety and fair abundance of game in most sections of the State is beyond question. Deer and turkeys in sufficient numbers to make hunting them of pleasurable interest, can be found in every county of the State, and on Grand Prairie below Brinkley, prairie chickens are quite plenty. Quail are abundant everywhere outside of the heavy timber lands, indeed more so than any country I ever visited excepting California. Later in the season ducks and geese can be found in great numbers in all the bayous, sloughs and lakes, and those who like that sport can certainly be satisfied.

And here let me offer my first suggestion. If any are disposed to visit that country for the purpose of shooting, either in September or October, permit me to say to them in the imploring words of the refrain to an old song the Hutchinson family used to sing—"Don't go! don't go!" The first of November is early enough for several reasons—the weather is too warm before then for the comfort or pleasure of yourself or dog. If you get game it will soon spoil on your hands. In hunting quail you will find the ground so dry that your dog can not scent the birds, and, besides, your faithful friend will suffer almost intolerable thirst in an hour's run, and you will be forced to take him a mile or more to some spot where he can at least wallow in the mud mixed with a little water. My dog actually came up and barked in my face one day, which told me plainly, "I must have some water," and he had not been out an hour. Again, if you look for deer or turkey in the timber you will find the leaves on the underbrush and trees so thick that you can scarcely see fifty yards in most localities, and the moment your game starts it is lost to sight entirely. I am confident we started from seventy-five to one hundred turkeys and only succeeded in getting four, and I am sorry we got those, for they spoiled before we could get them to a depot to ship them home. Our quail and small game we took the precaution to have cooked, and thus enjoyed a share of it ourselves and divided with others who chanced to sit at our table.

But with all of these untoward circumstances my trip was a pleasant and profitable one. I left home almost sick, and though tramping from fifteen to twenty miles almost every day while there, I returned feeling like a new man; in fact I think the trip renewed my youth from five to ten years: so that it is not all of hunting to get big bags of game. I enjoyed beyond expression wandering amid those magnificent forests which shut me out entirely from the tread-mill drudgery called business, and I revelled in a moral, mental and physical atmosphere that dwellers in brick walls surrounded by paved streets know not of. It is strange to me that those who have the time and means at their command do not oftener take such life-giving trips.

We spent most of our time at and within six or eight miles of Wiener, Poinsett county, which perhaps is as good a point for all varieties of game as there is along the route of the St. L., A. & T. R. R. on which we traveled south from Cairo. On our return we met on the train Mr. J. B. Fordyce, who gave us much information in regard to the game localities in the State, and being a reliable gentleman and a true sportsman he would no doubt cheerfully aid any who are intending to visit the State in pursuit of game by imparting the knowledge he has gained by several years' experience in that country; in fact he said he would be glad to do so; his address is at Malden, Ark., or Gatesville, Texas; he spends most of his time between these two points along the line of the St. L., A. & T. R. R. From what I saw and heard I do not hesitate to say that this State is an excellent one for an outing when taken at the proper season. There are immense tracts of dense forest and thousands of acres of open prairie, scarcely disturbed by the settler, where game abounds in fair quantities and a party need not return with empty bags when visiting that section in the proper season. A.

CHICAGO, Ill., Oct. 5.

SCHULTZE GUNPOWDER.

Editor Forest and Stream:

The present waterproofed granulated Schultze gunpowder is the most perfect practical outcome of the endeavors to utilize the discovery of the effect of nitric acid upon cellulose (converting it into an explosive) for small arms.

It was early found that gun cottons, the cotton forms of these nitro-compounds, though giving such tempting results in total absence of smoke and solid residue, were far too violent and sudden in their combustion for use in ordinary firearms.

Attention was then turned to other forms of woody fibre, and the actual woody portions of trees were chosen as giving the most pliable compounds with nitric acid.

The first Schultze gunpowder (so called from the name of its introducer), after having given satisfactory results in the home of its invention, Germany, was offered to the English public about twenty years ago; it was rapidly appreciated by English shooters and a company was at once formed to manufacture it in England, which company continues at the present day as the oldest and most experienced of the makers of nitro-compounds and smokeless powders for small arms, having succeeded in overcoming difficulties and prejudices, and in making their manufacture a commercial success. Their latest form of Schultze gunpowder, which they wish now to bring before the shooting public of the States, has been generally acknowledged as the perfect nitro-compound for shotguns.

When first manufactured in England, nineteen years ago, the Schultze gunpowder was in the form of little particles or cubes of wood, cut transversely from the trunks of selected trees, and treated with the chemicals necessary to render them capable of burning with sufficient rapidity to act as a gunpowder. And in many respects this cube gunpowder was very satisfactory, the great drawbacks being the want of regular density in manufacture, and the special loading—hard ramming—required to develop good shooting results.

To overcome these difficulties, the granulated form was introduced ten years ago, and this, being of even grain, and regular density, requiring no ramming or special loading, giving as great facilities for loading as does black powder, marked a great advance on the cube form, and the granulated Schultze gained ground everywhere as a safe, reliable gunpowder.

It was, however, to a certain extent subject to the effect of atmospheric influences, damp weather weakening and dry weather strengthening it. These drawbacks were completely overcome about three years ago by adopting a process by which, at one stage of the manufacture, every separate fibre is waterproofed before being formed into grains, and the rapidly increasing demand for the waterproofed granulated Schultze gunpowder for trap and general shooting, and the perfect safety to users of it, warrant the manufacturers in calling their gunpowder perfectly safe, reliable, effective, smokeless and cleanly in use.

The company's factory is kept in a high state of efficiency, and the processes are carried out with the greatest care. In evidence it may be mentioned it is now ten years since the slightest accident occurred in the manufacture, an excellent record for a powder factory.

The shooting ranges, with the testing apparatus, are very complete, and no expense is spared on this head to adopt every known method of any value for arriving at the true force and behavior of the gunpowder made. In writing (*Field*, Nov. 10, 1886) on a visit to the factory, the editor of the London *Field* made these remarks: "These works contain the most perfect and complete set of instruments for carrying out experimental investigations connected with sporting guns that it has ever been our fortune to meet with."

The process of manufacture is briefly as follows: Soft timber of clean growth is selected, and after being torn to fragments is treated chemically until the whole of the resinous and soluble matters in the wood are extracted and the pure, finely divided cellulose remains. This is carefully dried and treated with the usual acids. A long course of purification then commences; it is washed with cold, warm and boiling water successively, continued for a month, until the nitro-compound is perfectly free from every trace of decomposable matter, so that it may pass the very stringent test for purity imposed by the English authorities on all explosives in the British Isles.

This test insures perfect safety in storage and handling, and is a guarantee that Schultze gunpowder is a pure stable compound; and that the authorities are satisfied with the way in which Schultze passes the tests is evidenced by their annual report, in which they state the whole of the samples of Schultze gunpowder tested passed the test for purity very satisfactorily.

The nitro-compound so formed is then ground to a minute state of division, and at that stage waterproofed. Chemicals to regulate the rapidity of combustion are then added and the whole mixture is formed into grains. These are subjected to heavy hydraulic pressure to regulate the exact density of the grains, and finally dried and sifted. But one quality, strength and size of grain is made, and this is known throughout the shooting world as Schultze gunpowder, granulated and waterproofed. When finished the powder undergoes exhaustive tests for its strength, bursting force, rapidity of ignition and combustion, etc., and if satisfactory, is passed to magazines, where it is kept three months. Again it is exhaustively tested, and if quite up to the mark, packed and issued. This second testing is adopted to make assurance doubly sure. It is made in very large batches, each one consisting of many thousands of pounds—a most important point in all gunpowder making to secure perfectly uniform results.

And now as to the properties of Schultze gunpowder. Those which the public requires in a nitro-compound are in the chief place (1) safety and (2) smokelessness: for, given these with (3) good strength, no one would be satisfied to use the black with its smoke and dirt. Among the minor points required are (4) cleanliness, (5) no action on gun barrel ("pitting"), (6) less gun recoil, (7) quick ignition, (8) perfect regularity. A word or two on each of these points.

1. Safety.—The measure of pressure on gun barrels is a point always carefully tested, and the total absence of accidents in England with Schultze gunpowder is the best proof the powder is rendered safe. Many elaborate experiments have been carried out to show actual bursting pressure on gun barrels; none of them perhaps give the exact figures in pounds pressure, but they give comparative results perfectly.

The method adopted principally at the company's factory is described in detail in the London *Field*, Nov. 20, 1886. This is too long for reproduction here, but the results show Schultze to give less pressure on the powder chamber than black gunpowder (taking No. 4 as the standard), measure by measure. But on this point an outside opinion would carry weight, and we are happy to find the gentlemen who form the Proof House Guardians of Birmingham and London have largely experimented in this direction, and have found Schultze gives less pressure charge by charge on the gun barrel than No. 4 black powder, and even Messrs. Curtis & Harvey admit, in a recently issued pamphlet describing experiments carried out by themselves, that Schultze gives less bursting pressure on the powder chamber than does their own No. 4 black gunpowder. In neither case were these experimentalists likely to be biassed in favor of Schultze gunpowder. The editor of the London *Field*, a veteran experimentalist, recording the result of his experiments in the issue of the *Field* of Feb. 14, 1885, reports the Schultze gunpowder to be safe, and to give less pressure than No. 4 black powder, even under varying conditions of temperature and dryness, even when dried to absolute dryness, and reporting upon the crusher system of taking pressures in the issue of Nov. 20, 1886, he says: "Black invariably shows a greater strain than Schultze at the first crusher gauge."

2. Smokelessness.—This the Schultze possesses to a marked degree, being of all gunpowders offered to the public the most smokeless.

3. Strength.—Schultze is always issued giving a trifle greater propelling force than double the weight of black gunpowder, or measure by measure with black No. 4. The strength is measured by various methods, but the crucial test adopted is the velocity given to the body of the charge of shot pellets; these are collected on a specially designed sectional target and the velocities of the pellets measured by electrical chronograph. The general acceptance by the shooting public of Schultze as the hardest hitting powder, especially where money is depending on the result, is the best proof that the manufacturers are not wrong when they claim for their Schultze gunpowder "greater penetration" than black.

4. Cleanliness.—In this also Schultze is in the van, the solid residue (amounting to 25 per cent. of the charge against that from black powder amounting to 65 per cent.) is white or nearly so, and condenses into dry particles which roll from the gun or are driven out by each discharge, and there is no greasy residue nor accumulation in the barrel nor hard incrustation.

5. Pitting in Barrel.—There is a total absence of this with Schultze. The residue is alkaline and dry and never corrodes the gun barrel. It is therefore not so necessary to clean a gun when using Schultze as when using black gunpowder. It is noticeable in guns in which Schultze is fired from the first and black gunpowder from the second barrel, after some months of usage, that the Schultze barrel is perfectly bright, though the black barrel may be and often is corroded.

6. Less Gun Recoil.—The manufacturers do not aim at making a powder which gives a very low gun recoil, knowing that is incompatible with good propelling force and safety in use, but as a matter of fact Schultze does give about 7lbs. less recoil in a 12-bore gun and 11lbs. less in a 10-bore gun, using corresponding charges, than black. This is principally owing to the fouling being so much less with Schultze than with black; the friction and dead weight of the solid residue is therefore much less with Schultze; for instance, 4drs. of Schultze in a 10-bore gun, the usual charge, will give a solid residue of 14grs., while the corresponding 4drs. of black will give a solid residue of 73grs., giving 59grs. more of residue to be moved in the case of black than in the case of Schultze; this is equal to an extra ½oz. shot. This explains the seeming paradox that Schultze with equal propelling force to black gives less recoil.

7. Quickness of Ignition.—There are two distinct operations performed when a gun is fired, the ignition of the charge of powder by the primer and its subsequent combustion when ignited; the quicker the combustion the greater the strain on the gun barrel, while the quicker the ignition the greater the comfort to the shooter. Schultze is therefore made to ignite readily and to burn comparatively slowly, the whole time taken by the two operations from the fall of the hammer on the primer and the leaving the muzzle of the gun of the shot, occupying with the standard English Eley primer and Schultze gunpowder about .0090 of a second. This is regularly tested so as to guard against any tendency to hang fire. Experiments carried out with American shells and primers show these to have a strength compared with Eley's standard primer and Belgian primers as follows: American No. 2, 6; Eley's ordinary, 9; Eley's stronger, 12; Belgian, 15 to 17. As it is possible therefore that the American primer is hardly strong enough to do justice to the Schultze, and to obviate the necessity for any priming with black powder, the Winchester Repeating Arms Co. and the Union Metallic Cartridge Co. are kindly experimenting with a view to issue a shell with a primer of the same strength as Eley's ordinary, and this, if carried out, will give satisfaction to users of black as well as nitro-compounds, as with a stronger primer even black powder gives more satisfactory results.

8. Lastly, perfect regularity is attained by great care in manufacture, and by making in very large quantities at the time, so that any small differences are lost in the great body of the batch.

In conclusion allow me to state, we have opened an

agency for the sale of Schultze gunpowder at No. 8 Murray street, New York, as will be seen from your advertising columns; and all necessary information as to loading, etc., will be gladly offered. It may be, however, as well in general terms to give a few simple rules for the loading of Schultze, so as to give satisfaction. Too large a charge should not be used; 3drs. (42grs. by weight), in a 12-bore, and 4drs. (56grs. by weight), in a 10-bore are good charges and generally sufficient. Load exactly as with black, placing a tight-fitting card or cloth wad over the powder, seating it firmly. Do not ram the powder. Allow sufficient shell for a fair crimping in, but not too much. By following these rules, cartridges will be loaded to give the excellent results arrived at by the large English cartridge loaders, whose Schultze cartridges now bear a large proportion to the black cartridges issued, and are used by the bulk of the customers of the chief houses in London and Birmingham, with entire and growing satisfaction.

Schultze gunpowder is issued of one density and strength, exactly one-half density and fully double strength of black No. 4, so for use take one-half by weight or equal in measure to the charge of black No. 4.

R. N. S. GRIFFITH.

EYEWORTH LODGE, Lyndhurst, Hants.

SHOOTING NOTES.

THERE is a big crop of quail and some partridges (ruffed grouse) in the vicinity of Green Pond, Morris county, N. J. The abundance of quail is due to the constant re-stocking of the perserve owned by Mr. Kinney, of cigarette fame, which is located not far distant. Mr. Kinney also planted some English partridges on his place, several of which have been recently killed by local gunners.

Samuel Castles and Charles Hedden, of Newark, shot a few hours at Pine Brook, N. J., one day last week. They moved six snipe and two or three woodcock on the flats; and got several of them.

There are quite a number of quail on Bradford and Upshur Necks in Accomac county, Va., but land owners will not allow strangers the privilege of shooting, and save the birds for their friends. Before the New York, Philadelphia and Norfolk Railroad made its ways down the eastern peninsula, this was the choice shooting ground of Bob Robinson and Ben West, of Brooklyn; the late Frank Palmer and the late Ben DeForest, and William Parks of this city. In those days thirty-five quail could be killed by one gun every day.

The Doughty boys on Hog Island, Va., are making preparations for a big season. There are more blinds stuck this season in the Virginia broadwaters than ever before known. Already the ducks have begun to come. Some one is baiting for black ducks in Cherry Creek Harbor, and as several strange boats have been noticed off Brant Hill, it is thought the Maryland night shooters contemplate a raid on the fowl, prior to working their way south. I have seen these fellows following their nefarious calling several times, and have seen how disastrous night shooting is in its effect to drive away fowl. The Hog Islanders are wild on the subject and threaten all sorts of things if they catch the "night shooters." It is my private opinion, publicly expressed, that they need not go far from home to catch some of the culprits who are engaged in the same low-lived business. I have seen some remarkable looking reflectors in several of the houses on the island.

It is rather unusual at this time of year to see so many jack curlew and willet as are now congregated on the bald marshes off the coast of Accomac county, Va. They make morning and evening trading flights, going north at daylight and returning about sundown. There are also some sandpipers and black-breast plover on the shoals at low tide, with which the oyster rocks are crowded at rising tides. Occasionally a flock of sickle-bill curlews string their way across the sinks to some favorite muddy creek bank in some wild and secluded marsh. As a rule the birds are wild and pay but little attention to stools. Two friends of mine have just returned from Burton's Bay, and they did not average over fifty birds a day between them. This is bad work for these marshes, and I have done much better myself in the same place in the dead of winter, when the majority of the birds had moved south. I remember seeing on Dec. 14, 1881, the day before the big freeze, more curlews and willet on Trout Channel Marsh than I have ever seen before or since in all my travels. It was too cold to lay in a battery, and I went on the marsh to walk black ducks up out of the little drains. The tide came up very high toward night and all the oyster rocks and bars were submerged. Birds coming from northean marshes began to collect on the big bald marsh. They were very restless and circled over the marsh in immense flocks. At last they all got together in one big gang, which, in the distance, looked like the rising of a great sea fog. The flock was over two miles in length. Capt. John Ed. Mears, of Locust Mount, was with me, and although a gunner for many years on these waters, he never saw the like. One tail end of the flock swept by Bill Doughty, who was in his blind brant shooting, and he killed forty-four curlew out of the gang with his big 20lb. goose gun.

A little boy, name unknown, sold a woodcock to a friend of mine up in Rockland county the other day that had but one leg. People whose business it is to know where birds' legs ought to grow say the bird never had but one, the other was probably lost in the shuffle. I wanted my friend to allow me to publish his name and full particulars, but he was afraid, so he said, of having the boys down in the street get on to the story, and being called the "one-leg woodcock" by them for some time to come. This woodcock freak reminds me of the three-legged one now in the possession of John Sutherland in Liberty street. It was shot some six years ago in Westchester county, N. Y. Unfortunately the bird was picked before the extra leg was discovered. It was attached to the bird near its vent. Instead of having four toes, three front ones and one hind one, as is customary with all well regulated woodcock, it had an additional toe in front. The nails on the toes of the extra leg were half an inch in length. Mr. Sutherland has the bird preserved in spirits.

The Chesapeake Bay duck shooting this season promises to be unusally good. From Havre de Grace I learn that there are a great many redheads and canvasbacks bedded on the flats. There is an abundance of feed, so that by the first of November when the season opens the lucky ones who own rigs in these waters will have some birds to shoot at. It is a great misfortune that the fine shooting of the upper Chesapeake should be so much disturbed by night gunners. In spite of what every one says to the contrary, I know there are big-guns at this time not far from Spesutia Island. It's about time the owners of the ducking shores made another raid.

It is not very often that Long Island affords good English snipe shooting, but on Saturday last a friend of mine killed eighteen birds in one cornfield adjoining Mecock Bay, near Bridgehampton.

On Friday last there was a big flight of yelpers in Shinnecock Bay and Moriches; about 200 of these birds came to the Robbins in Fulton Market.

There are plenty of woodcock now in Connecticut, while the crop of grouse in Rockland and Green counties, in this State, seems to be even larger than was first anticipated.

Thousands of migratory ducks passed Barnegat Light on Sunday last bound for the waters of the sunny South.

THE WISE ACRE.

NEW YORK, Oct. 17.

CONNECTICUT SNARING AND EXPORTING.—Hartford, Conn., Oct. 14.—*Editor Forest and Stream*: Are there any sportsmen in New London county, Conn., who will try to punish the violators of game laws? One party attempted to ship some ruffed grouse from Hadlyme, Conn., the last of September and was caught at it, and I have been trying ever since to find some one who will try the case. The violating being in New London county, I am handicapped. In 1883 the following law was enacted: "Sec. 1. The selectmen of every town shall appoint two or more persons to be game wardens, who shall assist in detecting and prosecuting offenses against the game laws, and shall be paid the same fees allowed grand jurors in criminal cases. Sec. 2. Game wardens shall hold their offices for the term of two years from the date of their appointment, and shall have the same powers as other officers to arrest for the violation of any law relating to game." Now snared birds are being shipped from New Haven, Stafford Springs, New London, Stamford and other towns, and nothing is done. We have a law prohibiting carrying game out of the State. If you know of any game wardens outside of Hartford, kindly give me their address. Since my appointment (about six weeks ago) I have had several letters from weak-kneed milk-and-water sportsmen, who say Mr. A. and B. are selling birds out of season, but "don't you mention my name, I will help you all I can." If you can assist me in finding out how a person can be prosecuted in New London county, Conn., it will oblige me, and any sportsman in this State that wishes to co-operate with me in trying to enforce our game laws kindly write me.—A. C. COLLINS, Game Warden.

POSSESSION OF VENISON IN NOVEMBER.—Norristown, Pa., Oct. 17.—In your issue of the 6th inst., I read the law about deer and elk. What is meant by "No person shall kill * * * any wild deer, save only from the first day of October * * * to the fifteenth day of December * * * and no person shall have in his or her possession or offer for sale * * * deer, save only from the first day of October to the thirtieth day of November." I cannot understand why we are allowed to shoot deer for fifteen days and yet dare not have them in possession?—ROUND KNOB. [The law as printed in the FOREST AND STREAM was credited to the pamphlet compilation prepared by direction of the Legislature. For the printer's convenience we used also as copy the law as printed in the Pennsylvania Fish Commission report. The word "November" is there given, but it must be a misprint for December, since in the pamphlet the last month is named.]

CAPE COD, Mass., Oct. 10.—The prospect for quail shooting in this part of Massachusetts is good. Quail have bred well, but there are many broods of young scarcely able to fly; in fact, I think there is an unusual number of small quail this season. A man found a nest containing ten eggs about Sept. 20, and on looking for the eggs one week later found that all but one had hatched. About Harwich we find as many coveys as usual. Have not heard from lower parts of the Cape. Oct. 8 your correspondent and two gentlemen, who intend to have several weeks' fun with the quail as soon as the law is off, took a few hours' tramp in the vicinity of Yarmouth to see how birds were in this locality. We found several coveys of large birds and one of very small ones. We also started quite a number of partridges. The law goes off Saturday, and we expect to be up bright and early ready to give the brown beauties a try.—CHESTER.

MICHIGAN WARDENS.—Central Lake, Antrim County, Mich, Oct. 14.—The Board of Supervisors has allowed the deputy game and fish wardens $2 per day for services rendered the past season. This is gratifying to us, as there was a chance at least that their bills would be thrown out altogether. A good deal of honest work has been done by these gentlemen, and there is evidence of a gradually increasing public sentiment favoring the enforcement of the laws for the better preservation of our fish and game. —KELPIE.

HOULTON, Me., Oct. 13.—J. H. Carlisle, of Houlton, and several other sportsmen of that place, have just returned from a successful hunt at St. Croix Lake, bringing in the fattest caribou ever seen at that town. A few days since two deer were seen herding with domestic stock within two miles of the center of the city. Some thoughtless children drove them from the field or the sportsmen would have bagged them.—WARFIELD.

WOODCHUCKS.—Dryden, N. Y., Oct. 15.—Those Connecticut fellows are "no good," so far as numbers of woodchucks slain are concerned. I have, since the 15th of last April, killed 103. I killed them with 330grs. lead, thrown with 70grs. of powder from a single-shot Winchester rifle, .40-cal., and at from 30 to 175yds. Who can beat it?—O. J. H.

REELFOOT LAKE.—The hotel at Reelfoot Lake, Tenn., formerly known as Idlewild, is now the Kentucky Club House, and is open only to members.

NEW YORK GAME PROTECTORS.

THE game and fish protectors and their districts are as follows, the list being furnished to us by Secretary H. H. Thompson:

First District—Geo. W. Whitaker, Southampton, Suffolk county. District: Counties of Suffolk, Queens, Kings and Richmond.

Second District—Jos. H. Goodwin, Jr., King's Bridge, New York county. District: Counties of New York, Rockland and Orange.

Third District—Matthew Kennedy, Hudson, Columbia county. District: Counties of Westchester, Putnam, Dutchess, Columbia, Greene and Ulster.

Fourth District—Francisco Wood, Schoharie, Schoharie county. District: Counties of Albany, Schenectady, Schoharie, Delaware and Sullivan.

Fifth District—Seymour C. Armstrong, Riparius, Warren county. District: Counties of Rensselaer, Washington, Saratoga, Warren, and the town of Indian Lake, in Hamilton.

Sixth District—John Liberty, Elizabethtown, Essex county. District: County of Essex, all of Clinton except the towns of Clinton, Ellenburgh and Dannemora; the town of Harrutstown, and so much of Brandon and Dickinson, in the county of Franklin, as lies south of an extension of the northerly line of Harrutstown, through the said towns of Brandon and Dickinson to the west branch of the St. Regis river, and thence to the east line of St. Lawrence county.

Seventh District—Peter R. Leonard, Ogdensburgh, St. Lawrence county. District: All of the county of St. Lawrence, all of Franklin except the territory included in district number six, and the towns of Clinton, Ellenburgh and Dannemora, in Clinton.

Eighth District—Thomas Bradley, Rockwood, Fulton county. District: The counties of Montgomery and Fulton, and the towns of Wells, Lake Pleasant, Hope, Benson and Arutta, in Hamilton.

Ninth District—John L. Brinkerhoff, Boonville, Oneida county. District: The county of Lewis, all that part of Herkimer lying north of Moose River to the north branch of that stream, and north of the said north branch to the west line of Hamilton county, and the town of Long Lake, Hamilton county.

Tenth District—Nathan C. Phelps, Remsen, Oneida county. District: All of the county of Herkimer lying south of the north line of Moose River to where the north branch enters the main stream, and of the north line of the said branch, and the town of Morehouse, Hamilton county.

Eleventh District—Frederick P. Drew, Washington Mills, Oneida county. District: The counties of Oneida, Otsego, Chenango, Broome, Cortland and Tioga.

Twelfth District—William N. Steele, Clayton, Jefferson county. District: The counties of Jefferson and Oswego, except the waters of Oneida Lake in Oneida and Oswego.

Thirteenth District—William H. Lindley, Canastota, Madison county. District: The counties of Madison, Onondaga, Wayne, and the waters of Oneida Lake in Oneida and Oswego.

Fourteenth District—John Sheridan, Penn Yan, Yates county. District: The counties of Cayuga, Seneca, Schuyler, Yates, Chemung, Tompkins, Steuben and Allegany.

Fifteenth District—George M. Schwartz, Rochester, Monroe county. District: Monroe, Livingston, Orleans, Ontario, Wyoming, Genesee and Orleans.

Sixteenth District—Stephen A. Roberts, Buffalo, Erie county. District: Erie, Niagara, Chautauqua and Cattaraugus.

Sea and River Fishing.

Address all communications to the Forest and Stream Pub. Co.

IN THE LAND OF THE MICMACS.

HOW anxiously we gazed up the broad Miramichi to catch the first view of Red Bank, the village home of the Micmacs, among whom we expected to get our guides and canoemen. Presently the arms of a huge wooden cross rose slowly above the hilltops in the distance and stood out in bold relief against the clear Canadian sky—an unfailing sign of an Indian settlement. Columns, too, of pale smoke were soon observed stealing upward from out the groves and melting away in the thin blue air, as the red race itself melts away before the tread of the white man. As we rounded a point in the river we saw the bank and shingle in front of the encampment thickly dotted with bright yellow bark canoes, drawn out and turned over as is the Indian custom; but no other sign of life met our eyes as we dropped anchor abreast the village. Commodore James reached for the cord of the whistle, and the wild scream soon peopled the bank with a motley crowd of Indians, squaws and pappooses, who rushed from their bush-hidden wigwams at the first echo of this unusual noise, and stood jabbering away to one another in excited tones.

Pushing off from the yacht, we went ashore in our tender. At our approach the women and children quietly withdrew, but, womanlike, the curiosity of the former kept them within sight and hearing. Some of the men advanced and received us kindly, calling us by the familiar name of "brothers." We were struck with their appearance. The majority of them were of pure Indian descent, strong, stout, sturdy fellows, with rich brown complexions, tinged somewhat with yellow, with long, straight, black glossy hair and broad, strongly-marked features. No admixture of foreign blood has destroyed the splendid native physique of the red man in this locality. They are as they were when, two hundred and fifty years ago, their forefathers welcomed to their shores the indomitable Nicolas Denys, the first white man visiting this region.

When we had made known the object of our visit a pow-wow was held, nearly all the men at home at the time taking part, though only a few did much talking. One especially, called Sâk, speaking English quite well for an Indian, and assuming an air of superiority among his fellows, was foremost among the speakers; and we observed, too, that the rest had a very high opinion of him, for they listened attentively while he addressed us on the difficulties of the proposed trip, assenting to his views in the usual Indian manner by a long drawn ă ă. The end was sooner reached, no doubt, through the kindly influence of a timely treat of booktawichk, which roused the drowsy nature of the red man, when unemployed, and brought him out on the jibboom of business. Six canoemen and three canoes were hired. Our camping outfit and provisions were soon transferred and stowed away, and about 1 P. M., in our light craft, each manned by two canoemen, we were stemming the strong current of the Little Southwest Miramichi.

Just above the Indian village the river makes a sudden turn, thence sweeping around in a great semi-circular curve. The bank on one side is composed of reddish clay, is 60ft. high and void of vegetation. This is known by the name of Red Bank. Thither, tradition says, the red men of Acadie came ages ago to procure material for the manufacture of their tumakums (pipes), especially the calumets or pipes of peace; at least so said our friend Sâk, the Indian philosopher of the party.

The current increased in strength, and an occasional rapid added to the labor of the men, but that stock of native patience and endurance of which we were to have many proofs on this excursion, now began to show itself. Either because they expect too much, or are ignorant of the character of the work being done, many sportsmen

are wont to belittle the staying powers of the Indian, and represent him generally as an overrated man. This is a great mistake. He is certainly gifted with remarkable powers of endurance and a mysterious supply of strength, besides his patience and coolness in difficulties is proverbial. As we sat beneath a shade in the middle of our canoes, and watched these sturdy fellows plying their poles, stroke after stroke, for long weary hours, forcing the canoes upward through the rushing water, sometimes scarcely moving, though all their strength was being exerted, not a word of complaint, not a sign of weariness, with the perspiration flowing down their swarthy cheeks and falling from their beardless chins, we could not but wonder at the admirable manner in which nature had fitted these sons of the forest for hardship and toil.

An Indian would almost lose caste were he not to use "tumawa" (tobacco), and they begin to smoke it when very young; for sly, bead-eyed pappooses of a few summers are frequently seen at this manly pastime, when their jaws, though strong by nature, require the help of the tiny hands in holding the pipe. When working, however, the typical Indian does not smoke, he chews; and what an amount of black jack he consumes! The harder he works and the more he perspires, the larger and more frequent are the quids of tumawa.

Toward the middle of the afternoon my canoe, which had started a little behind the others, gradually drew up, and seeing this I urged my men to pass their companions, promising them in the event of their succeeding an extra drink of booktawichk. They responded with alacrity and made a gallant dash for the lead, but their competitors hugged the shore, keeping well in, thus obliging my canoemen to struggle with all the force of the current. It was, however, a beautiful race. For ten minutes every nerve and muscle were taxed to their utmost. The poles rose, flew through the air, flashing in the sunlight, and with a sharp "clink" upon the stony bottom; the brawny voyageurs threw their whole weight upon them and the canoe rose and shot through the water with a gushing noise that was music to my ears. With the greatest interest I watched my brave fellows struggling against heavy odds, but their antagonists still hugged the shore and forced them into the stream. How much tumawa was eaten during these ten minutes I cannot say. What concerned me most was the manner in which the cuds reached those grinding jaws. As the poles went flashing through the air on the recover stroke, one hand would fly into the "poochnagun" or tobacco bag, grasp the plug of tumawa, carry it to the eager jaws, which closed upon it like a steel trap and back again it went to the pouch, the hand being upon the pole again as the iron point sunk upon the pebbled bottom. Not a stroke was lost, not a moment wasted by the operation.

My fellows, however, lost the race, but they had made such a brave fight that I declared they had fairly won their booktawichk, and rewarded them accordingly. Later in the afternoon, however, we came to a long reach of still water, and my red men again made a dash for the lead, winning it this time and an extra draft of gentle firewater.

Much of the country passed through that afternoon was very beautiful. The hills on both sides sloped gradually to the river, and were covered with dark evergreens intermingled with the paler green of the maple and silver birch. Many little intervale islands, too, were seen, natural meadows without a bush covered with short grass and spangled with flowers—the nodding blue bell, the gaudy lady slipper, the wild honeysuckle and quaint pitcher plant being seen in profusion.

Toward sunset we encamped on a level terrace in the midst of leafy maples and tall balm of Gileads, the latter exhaled their not disagreeable fragrance, which grew stronger during the night, and was very marked in the morning. Our canoemen were very tired. The first day or half day is always the same—harder than any subsequent one. It was, however, surprising how soon our tents were spread, provisions stored and supper made ready. But we were now destined to see their Indian nature manifest itself in a manner that caused us much surprise, nay apprehension, for the future well-being of the party. To say that these six were merely hungry, and ate a good "square meal," would convey but a shadow of the reality. They literally fell upon our provisions with the appetites and capacities of ravenous animals, and did not desist until they had actually gorged themselves. The six sat upon the grass around a little fire, a few yards from where we were seated at tea. Something caused us to look in that direction, and then we stopped eating, and with open mouths and tea cups half raised, gazed in wonder for a minute or two at their gastronomic feats; then we looked dismally at one another.

James was the first to break silence: "We had better go back in the morning, boys; they'll clean out our week's supply in two days and then what?"

"Let them starve the rest of the time," replied Walter, "as they certainly have been doing for the last week."

"Tell me now, if ye plase," observed Davy, our cook and *valet de tenté*, lately from the old country, "air thim ridskins onyways oncivil whin vittels air scarce?" The speaker had no liking for Indians, and if looks are to be believed, had silently protested against our employing them.

"Not so long as dogs can be had," I replied, "they have a sweet mouth for dog meat."

"Dogs!" said cookey in amazement, "arrah sure ye're talkin' now. The brutes don't ate dogs, do they?"

It's their way," said James, with a sly wink at the rest of the party, "and if a stray cur can't be found when their stomachs are empty and blood up, it may go hard with some of us."

Cookey took another look at the Micmacs. Hands, knives, fingers, mouths and grinding jaws were hurriedly doing the terrible work of destruction. A bright idea seemed to strike him, and turning toward us he said with an air of relief, "Sind one o' the boats fur more vittels in the mornin'."

"A capital suggestion, my good fellow," returned James; "we shall certainly have one to spare if they hang to it much longer."

In about half an hour they showed signs of "letting up," as we say in Canada, and soon the tumakums were filled and lighted. Then began some general conversation, and the quaint, jerky laughter of the red man was borne to our ears. That meal had worked as great a change in their spirits as it had in our larder.

After tea we joined the motley crowd, and attempted to draw them into rehearsing some of their legends and traditions. Soon, to our disappointment, all relapsed into silence but Sâk; for we soon learned that the average Indians on such occasions leave all the talking to one, who has won his respect either by wisdom or oratorical powers. Sâk was an acknowledged authority among them. As I have said, he could read and write, talk learnedly in broken English of the past and present, and was either full of Indian traditions, or perhaps, blessed with a fertile imagination. Presently the hooting of an owl was heard in the direction of a dark clump of trees on the right bank. Almost simultaneously the six red men uttered the word "Kookoogwes," and glanced at one another.

"Sâk, can you tell me why that owl is hooting over there?" queried James.

"Kookoogwes," began Sâk, "come long 'go from moon. Berry wise un, was kookoogwes. He foolum all birds. All um birds come seeum big-eyed kookoogwes from moon. Thinkum fine bird. Kookoogwes cunning as one ole fox. Tellum wee uns he likum berry much, come seeum. Chugeeges, that's im chickadee, little chugeeges go seeum, but they seeum little chugeeges no more, thinkum gone hunting. Tētēes, that's im bluejay, tētēes go showum kookoogwes how much fine bird him is. He no come back 'tall. They thinkum kookoogwes keepum for squaw, haveum in wigwam all time. Some day, little numutkulnāās, you callum wren, little numutkulnāās on moss walkum all round, hunting wechâk (flies). Hearum one big noise. Lookum up. Seeum kookoogwes killum an' eatum chipchowech (robin). Numutkulnāās he tellum pules (pigeon), and pules he walkum fast all over an' tellum all birds how chipchowech kookoogwes he eatum. Spec chugeeges an' tētēes kookoogwes doum all same. All holdum one big pow-wow. Makum tedâkilkoone (kingbird), chief, caus'um brave. All takum warpath on kookoogwes. Huntum all round. Kookoogwes berry much afraid. Hidum in tree, sometime creepum in hole all day. Kookoogwes come out in dark, berry mad, an' say all time koo-koo-kookoogwes, to no letum sleep, cause they huntum kookoogwes all day. Kookoogwes he doum all same now."

Thus we passed the evening, listening to many quaint but beautiful legends, nearly all told by Sâk, which to be fully appreciated should be heard at the camp-fire with the silvery leaves trembling above your head, your eyes upon your dusky companions, and the gloom of night settling down on the silent forest.

We withdrew about 10 o'clock, leaving the red men to prepare for "turning in." We sat in our tent and discussed the events of the day for half an hour or more, but before retiring paid another visit—a short, noiseless one, on tiptoe—to the Indian camp-fire. There silence reigned. Without blanket, bark, or even brush to shield them from the night air, they lay twisted and bent in every conceivable form around the smouldering embers. Some were snoring lustily, others sleeping the death-like sleep of infants. We gazed at the unconscious forms, while a feeling of pity or rather melancholy crept over our hearts, and a few minutes later, as we rolled ourselves in our blankets and the sound of murmuring waters fell on our ears, we asked ourselves the vexed question, "Is life worth living?" CHICKTECK.

NEWCASTLE, N. B., Oct. 8.

[TO BE CONTINUED.]

DULY SWORN TO.

STATE of Wisconsin, County of Dane, *ss:* William Dunn, being duly sworn, on his corporate oath, deposes and says he is a resident of the city of Madison, in said county and State, and that he has resided therein for more that twenty years, and that he is now employed in the post l service of the United States, and that previous to entering such service this deponent had been engaged during his said residence in the city of Madison in the vocation of a fisherman.

This deponent further states that he is acquainted with the different species of fish to be found in the waters of the lakes adjacent to the city of Madison and particularly to be found in the waters of Lake Mendota.

This deponent further states that on the 8th day of October, A. D. 1887, he accompanied Grover Cleveland, then and now the President of the United States of America, as this deponent is informed and verily believes the same to be true, upon a fishing ex edition on said Lake Mendota. That the Hon. William F. Vilas, Postmaster General; the Hon. Daniel Lamont, one Dr. Bryant and others accompanied the President as a part of said fishing expedition, but that the said President and this deponent, during all the time they were fishing, were in a boat by themselves, and that on said occasion the President showed himself to be a good and skillful fisherman, nearly as good a fisherman as this deponent is, and that the said President caught eight good black bass, one of which weighed four pounds and four ounces and the other four pounds and eight ounces; that this deponent, fully realizing the gravity and importance of the statement, deliberately avers and states that the said eight fish were of the species known to fishermen and naturalists as fresh-water, small-mouthed black bass, and that two of these weighed as hereinbefore stated respectively.

This deponent further and solemnly states, upon information and belief, that his long experience as a fisherman has not disqualified this deponent from stating truthfully the number and weight of fish, when such fish are caught by persons other than this deponent.

This deponent further states that if any person or persons doubt or question the weight of said two fish as herein stated, this deponent is ready and hereby offers to produce in evidence whenever required so to do the scales upon which said two fish were weighed, which said scales are still existing and wholly unreversed and unappealed from.

This deponent further states that all statements, reports and rumors that said eight bass had previously been caught by Charley Bernard and this deponent and anchored out in the waters of said lake ready to be attached to the presidential hook, or that they had previously been caught by Alf Merrill and Con Kruez and by them placed surreptitiously in the President's boat while he was partaking of the hospitalities of the Rex Magnus Club, and that while under the delusive influence of the "Sauterne" furnished by that club he was made to believe that he had caught them himself, are silly, mean, and cowardly lies, like those that every day are found in the columns of certain newspapers, which violate every instinct of American manliness, and in ghoulish glee desecrate every sacred relation of private life, and that said false and unjust accusation and malicious slander were invented for the purpose of undermining the people's trust and confidence in the President's ability as a fisherman.

This deponent further states that he does not make this statement, and that he is not influenced in making it, nor has he added a single ounce to the weight of either or any of said fish, for love, fear, favor, affection or hope of reward, but that he presents things truly as they came to the deponent's knowledge, and this deponent expressly denies that the statements herein contained were inspired by the said Dan Lamont or that he has been unduly influenced in making said statements by the said Lamont or Vilas.

This deponent further states that he is ready to prove and maintain at all times that said eight black bass at the time they were so caught by the President as aforesaid, were under no duress, actual or constructive, but were each and every one of them free to accept or reject the bait offered to them by the President, and further this deponent sayeth not. WILLIAM DUNN.

Subscribed and sworn to before me this 11th day of October, 1887. C. K. TENNEY, Justice of the Peace.

LONG ISLAND FISHING.

GREENPORT, Long Island, Oct. 11.—On the 8th inst. two of our amateur anglers had remarkably fine sport with the hook, off this place, on the Sound. Messrs. Adams and Hart on that day in their rowboat caught in five hours fishing the good number of 262 fish, using only bunker bait. All of these were sea bass, with the exception of a half dozen of snappers. They caught no bluefish, weakfish nor porgies, as these fish do not bite, and they have probably left these shores for milder climates. The fish averaged nearly 1lb. each, twelve of them weighing 50lbs. The fish were yet eagerly biting when they abandoned the sport, but as the bottom of their boat was filled with the spoil and they had had enough of sport and pastime, they returned home, distributing the fish among some thirty hungry and thankful recipients.

The season for fishing is now near its close, and probably the first stormy and cool weather will cause the fish on this coast to migrate. The fishing for bass and bluefish has been remarkably good this season on the Sound and eastern coast of Long Island, and the handline committee are well content. ISAAC MCLELLAN.

MASSACHUSETTS TROUT.—Worcester, Oct. 2.—*Editor Forest and Stream:* In regard to the proper time of closing the trout season, mentioned in your last issue, from my own experience Aug. 1 would be none too early. On Aug. 19, this summer, in a catch of 31, 2 females that weighed ¾lb. and ¼lb. respectively, contained very far-developed spawn, and in the remainder nearly all the females contained some spawn, at least. I have also to announce a praiseworthy action of some gentlemen of the city. I refer to the organization of a sportsmen's club for amateurs and beginners. Its main object is to secure a better enforcement of the fish and game laws. I hope to record its complete success. There is a large field for work.—PEMIGEWASSET.

SOUTH BRANCH OROMOCTO.—St. John, N. B., Oct. 10.—Messrs. R. W. W. Frink and R. O'Shaughnessy have returned from the lake, after three days' fishing, with over 100 beautiful fish. Fifty or more of the largest fish were on exhibition in Mr. Shaughnessy's store this forenoon and elicited words of admiration from all who saw them. There were 120 lake trout: the largest two three days after being killed, 3¾lbs. weight; ten over 3lbs., twenty-five between 2 and 3lbs., the rest from 1lb. to 2lbs.—J. N. B.

BASS FLIES.—Herr Von dem Borne has been experimenting with black bass flies in German waters, and has tied a taking lure of red and yellow. This was the combination hit upon by Mr. A. N. Cheney, after three months of experimenting in 1882, and known as the Cheney fly. The bass are like men, they change their skies but not their tastes.

Fisheulture.

Address all communications to the Forest and Stream Pub. Co

LOBSTER CULTURE.

LAST week we gave a portion of Mr. Richard Rathbun's article on the artificial propagation of lobsters, from the Bulletin of the U. S. Fish Commission. He further says:

In a report to the U. S. Commissioner of Fish and Fisheries on the lobster fishery in the United States, the writer gives an account of what is know regarding the habits and abundance of both the American and European species, which differ but slightly from each other structurally. The investigations on which that report is based confirmed the fact, previously well known to those acquainted with the industry, that the abundance of lobsters, as well as their average size, has been rapidly decreasing from year to year on many portions of the coast ever since the fishery has been vigorously pushed. A study of the habits of lobsters indicates that such a decrease is far more possible with that species than with the true fishes, which are, as a rule, more secure from the attacks of man. That a decrease has taken place, and that in some regions it has amounted to a serious loss, is attested by the statements of numerous fishermen and dealers, which are quoted at some length in the report above mentioned.

All the States interested in the lobster fishery, excepting New Jersey, whose fishery is small, have enacted protective laws; but either because these laws are inadequate or are not properly enforced, they have failed to stop the decrease, though they may have checked it more or less. As a result, the fishery is falling off in the United States, and we are even now dependent, to a greater or less extent, on the British Provinces for the supplies of our larger markets. The same trouble exists in Europe, where the lobster fishery is, of course, of much older date than in this country, and where it has been controlled by legislation for many years. Many elaborate reports have been published upon the European fishery by experts appointed to investigate its condition and needs, but they are apparently at as much loss there as we are here regarding the methods and benefits of protection. In Norway, which country possesses the most important European fishery, they have, as a last resort, sought relief through the aid of artificial lobster culture, and experiments to that end have been carried on for several years. In the

United States, where the methods of fishculture are best understood and have been most productive of beneficial results, it is natural to suppose that the same course would have been often suggested, and such has really been the case. None of the trials have, however, been made according to the most approved methods of fish propagation, and inefficient means for carrying on any such practical experiments with respect to salt-water species of fish have alone prevented the Fish Commission from engaging in this work before.

It would be impossible, within the limits of this paper, to cite even a portion of the evidence bearing upon the decrease of lobsters which has been collected, but following are a few of the remarks with which this subject is introduced in the report already referred to:

"An illustration of the rapidity with which the lobsters of a small area may be caught up is furnished by a salt water inlet on the coast of Maine, in which lobsters were at one time very abundant. This basin opens directly into the sea, and is sufficiently large to have afforded a remunerative fishery to several lobstermen. Two years' time was sufficient to reduce the supply of lobsters to such an extent that fishing became unprofitable. After an interval of about five years they again became abundant, and the supply was once more exhausted. Had this inlet not been so situated that it readily received supplies from without it is probable that it would have required a much longer time to become replenished.

"On a much larger scale has been the depletion of the once noted grounds about Cape Cod, which at one time furnished nearly all the lobsters consumed in New York city. In the early part of the century this fishery was entirely in the hands of fishermen from other States, principally Connecticut, who came to Cape Cod with their smacks, and after catching a load carried it to New York or Boston. As early as 1812 the citizens of Provincetown realized the danger of exhausting the grounds about their town and succeeded in having a protective law passed by the State Legislature. More or less stringent regulations respecting the lobster fishery of Cape Cod have been in force from that time down to date, and they have probably done good service in prolonging the fishery; but the period of its prosperity has long since passed, as continued over-fishing has so exhausted the grounds on almost every portion of Cape Cod that they are no longer profitable even to the few men who still set their traps there. From the sketch of this region, given further on, it will be seen that the decrease has not been a temporary one, although an entire rest for a long period of time might possibly allow it to recover more or less of its former abundant supplies. As it is, no large catches are now made, and but few lobsters are carried away from the Cape.

"The immediate vicinity of Provincetown has suffered most in this respect, but scarcely more than any portion of the coast from that town to Boston on the one side and to New Bedford on the other. Vineyard Sound proper and the vicinity of Wood's Holl, Mass., have afforded but poor catches for a number of years; but the region about Gay Head has continued to attract the lobstermen down to the present time. Each succeeding year, however, lobsters have appeared to be less plentiful, and during the spring months and June of 1885, scarcely anything has been done. The fishermen are discouraged, and are forced to attribute the scarcity to over-fishing, the possibility of which many of them have all along denied. At Cuttyhunk Island the catch for 1885 was less than one-fourth that for 1880, and the same was reported of the remainder of the Elizabeth Islands, No Man's Land and Gay Head.

"In the waters of Rhode Island and Connecticut a large decrease of lobsters is reported by many of the fishermen, and the increased catch for the few years preceding 1880 was obtained only by the use of a much larger number of traps than was employed formerly. Although the fishery in those States was begun very many years ago, it is only within comparatively recent times that it has been extensively carried on.

"On the coast of Maine the evidences of decrease are very strong, especially as regards the shallower areas, but the rapid extension of the grounds into comparatively deep water has made the actual decrease less apparent. The rocky bottoms of the coast of Maine are also supposed to afford the lobsters greater protection than the sandy ones to the south, and in many places the traps cannot be set as closely together, nor is it possible that the lobsters in such localities move about as much in search of food.

"The greatest decrease has occurred within the past fifteen to twenty years, or since the establishment of numerous canneries and of the perfected methods of transporting fresh lobsters to all parts of the country. The demand being so much greater than the supply, there are no restrictions on the amount of the catch beyond those imposed by the State laws or resulting from the scarcity of lobsters. Fish are among the greatest enemies of the lobster, and cod are known to consume enormous quantities; but nature has provided against their extinction by such means, and it is man alone who has disturbed the balance."

The above remarks were based mainly upon the fishery investigations of 1880, since which evidences of continued decrease have been constantly received. About a year ago a prominent Boston dealer wrote that he was receiving large quantities of lobsters from Nova Scotia, as the Maine fishery was totally inadequate to supply the demand, the amount obtained from that State having been less than in previous years.

One of the strongest evidences of decrease in abundance is afforded by the continuous decrease in the average size of the lobsters sent to the markets. The exact amount of this decrease is not determinable, as no records bearing upon this subject were made prior to 1880, but the fact was granted by the fishermen and canners, even in those regions where a perceptible decrease in numbers was not admitted. The average weight of the lobsters marketed in most places in 1880 was estimated to be about 2lbs. each. A New Haven correspondent stated that the average length of the lobster sold in the markets in that place in 1880 was about 10½in., and the average weight about 2lbs., against an average length of about 13½in. and an average weight of about 3½lbs. twenty years ago. In Boston the market lobster ranged but little above the limit in size permitted by the State laws, and that seems to be the case nearly everywhere. In Portland, Me., the average length of the lobsters marketed in 1880 was about 10½in., and in Boston 11 to 11½in., while in New York city the range in size was from 10½ to 15in.

The facts above stated apply only to the larger distributing centers, where custom had prescribed the minimum limit in size of the lobsters marketed, before protective laws were enacted. At that time there was an abundance of large lobsters, and the smaller individuals were regarded as of little account for the fresh trade. They have, however, been used for a long time by the canneries on the coast of Maine, by the fishermen as bait, and to supply local demands. The quantity of lobsters consumed, measuring less than ten inches in length is, therefore, very great, and on some portions of the Maine coast the canneries make use of only those that are too small for the fresh-market trade. In fact the greater proportion of the lobsters now canned are less than ten inches long. From these statements it will be seen that there is a steady demand for lobsters of all sizes, and that but a limited protection is afforded either by laws or custom.

The American lobster has been taken as far south as off Cape Hatteras, N. C., where a single medium-sized individual (13in. long) was dredged from a depth of forty-nine fathoms by the Fish Commission steamer Albatross in 1884. Two or three examples have also been recorded from the northwestern part of the sea coast of Virginia, but the Delaware Breakwater may be regarded as practically the southern limit of its range, although it is not at all common at that place and is rarely fished for. Lobsters are somewhat more abundant off Atlantic City and Long Branch, N. J., where they afford a limited fishery, and in New York Bay and the adjacent regions they were at one time quite plentiful, but over-fishing and the pollution of the waters have almost entirely exterminated them there. Passing eastward through Long Island Sound, they gradually increase in abundance as we approach the Block Island region, and from there to the extreme northern limit of the coast of Massachusetts, wherever the bottom was suited to them, they were formerly exceedingly abundant. The first important fishery originated along this section of the coast, Cape Cod at one time having furnished New York city with nearly all its supplies. The sandy shores of New Hampshire are not so prolific in lobsters as are those of either of the adjoining States. Maine is now the principal source of supply for all the larger markets of this country, the yearly fishery of that State greatly exceeding in quantity and value those of all the other States combined.

Most of the British maritime provinces abound in lobsters which are especially plentiful on both the ocean and gulf coasts of New Brunswick and Nova Scotia, these two countries now affording the most extensive lobster fishery in the world. They appear to be much less common in Newfoundland and Labrador, possibly because they have been less fished for there. Lobsters are not known to migrate except very short distances, mainly in the spring and fall, when they change their grounds, moving into deep water on the approach of cold weather, and returning nearer to the shore in the late spring. The fall migrations are solely for the purpose of escaping the cold of winter, the shallower summer grounds probably furnishing a better supply of food. The extent of the movements depends more or less upon the character of the coast, for where the bottom slopes off very gradually they will need to go a much greater distance to reach a shitable depth of water than where deep holes occur near their summer grounds. The summer fishery is mainly in depths of a very few to 15 or 20 fathoms, the winter fishery in 25 to 60 fathoms. On the coast of Maine the traps are sometimes set in such shallow water that they lie partly exposed at low tide. Formerly some fishing was done along the shores by means of gaffs and dip-nets, but lobsters rarely occur in such favorable localities now.

It is supposed that lobsters do not travel much along the coast though they probably change their grounds from time to time in search of food. On some portions of the coast the fishermen claim to have good evidence of the schooling of lobsters, and state that the schools appear and disappear suddenly, indicating the possession of certain migratory habits, but there is no proof that their migrations extend far, and they are very different in character from those of the true fishes. We have no evidence to prove that any one region has been directly benefited by large accessions from an adjoining region, and the extent to which some districts have been depleted by over-fishing without subsequent recovery indicates that the supplies of one region are but little dependent upon those of another, at least not for immediate relief. The Cape Cod lobster fishery has been at a low standing for many years, and although but few men have engaged in the fishery of that region for a long time, there are, as yet, no signs of improvement.

[TO BE CONTINUED.]

The Kennel.

FIXTURES.

DOG SHOWS.

Dec. 6 to 8.—Third Annual Dog Show of the Central Berkshire Poultry, Pigeon and Pet Stock Association. W. T. Webster, Secretary, Lee, Mass.

Dec. 14 to 16.—Third Annual Dog Show of the Winsted Kennel Club. Frank D. Hallett, Superintendent, Winsted, Conn. Entries close Dec. 3.

Feb. 21 to 24, 1888.—Twelfth Annual Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent.

FIELD TRIALS.

Oct. 17 to 22.—Second Annual Meeting of the American Coursing Club, at Great Bend, Kan. G. I. Royce, Secretary, Topeka, Kan.

Nov. 7.—First Annual Field Trials of the Indiana Kennel Club at Bicknel, Ind. Open to dogs owned in Indiana. P. T. Madison, Secretary, Lock Box 4, Indianapolis, Ind. Entries close Oct. 25.

Nov. 7.—Third Annual Field Trials of the Western Field Trials Association. R. C. Van Horn, Secretary, Kansas City, Mo.

Nov. 21.—Ninth Annual Field Trials of the Eastern Field Trials Club, at High Point N. C. W. A. Coster, Secretary, Flatbush, Kings County, N. Y.

December.—First Annual Field Trials of the American Field Trials Club, at Florence, Ala. C. W. Paris, Secretary, Cincinnati, O.

Jan. 10, 1888.—Second Annual Field Trials of the Texas Field Trials Club, at Marshall, Tex. W. L. Thomas, Secretary, Marshall, Tex.

Jan. 16.—Fifth Annual Field Trials of the Pacific Coast Field Trial Club, near Kingsburgh, Cal. N. P. Shelden, Secretary, 320 Sansome street, San Francisco, Cal.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **5492.**

ELMIRA DOG SHOW.

HORNELLSVILLE, N. Y., Oct. 16.—*Editor Forest and Stream:* I was judge and superintendent of the Chemung county fair, held at Elmira, N. Y., Oct. 4 to 7. For the first attempt the show was good; about 125 entries. The awards in many instances are no good as a record, because the names of the dogs were not given.

Foxhounds were the best class I have ever seen. The winner in the bitch class was C. W. Robinson's Lady Naylor. Spot, who won first at Hornellsville in English setters also won first at Elmira, a good dog of the right type. Irish setters were quite a good class, Mr. Gaylor's pair, Mr. Arnot's pup and Mr. Gallagher's Peggy O'More would be in the money at any show. Mr. Gaylor also showed an extra good brace of pointer pups, Graphic—Clover; if nothing goes wrong they will be heard from later. There were two good Yorkshires, the winner in dog class also won first at New Brunswick and second, Boston, 1887. The Hornell Spaniel Club entered sixteen for exhibition only. In spaniels Mr. Eustace's Mack won first in dogs and Mr. Nashe's Sister in Black, first in puppies; she is the best I have ever seen. Mr. Van Ness, of Hornellsville, won first in beagles with his pretty little basket beagle Mignon.

The dog show proved to be one of the greatest attractions of the fair, the building being crowded with visitors all the time. They will form a kennel club and ask for admission to the A. K. C. next year and will offer premiums large enough to bring out the crack dogs of the country.

J. OTIS FELLOWS.

SPANIELS FOR BENCH AND FIELD.

Editor Forest and Stream:

I beg leave to take issue with your correspondent, Mr. H. G. Charlesworth, when he says "I will not stand quietly by and see two or three inches taken from their bodies and added to their legs," and in the sentence above he gives the names of dogs that he has evidently never seen as types, Old Tippo and Toronto Jet. Old Tippo was by no means a "sausage," but a dog that stood on fairly long legs, if I may use the term to distinguish it from what is now the fashion, *i. e.*, short legs. Toronto Jet was a good bitch, but would not be looked at now as she was not made on the modern mould, still these two dogs were able to do an amount of work, as our good old friend Mr. Kelly, of Woodstock (since dead), has often told me of the work they have done and the number of birds he has killed over them, and that, too, after the ground had been thoroughly hunted over by setters and pointers and drawn blank. What we want to get are dogs of the Tippo stamp if we want to use them for the field. I may say I have had all types of cockers, from the old liver and white to the most modern black, and this I can say from daily experience that the long-bodied, short-legged dog cannot hold out and do his work as well as his shorter-bodied, less fashionable ancestor did.

Cannot we strike a happy medium and possess both a fashionably made and useful dog for the field? The original standard of the American Cocker Spaniel Club is about right—*i. e.*, have the dog from tip of nose to root of tail rather more than twice the height, and given as weight under 28lbs. This will give a dog about 13 to 14in. at shoulder and about 28in. long for the maximum. And of course the smaller dog will be less length according to weight and height. An 11in. at shoulder should be about 23in. long. Any great divergence from these measurements will give a dog out of proportion to the standard. I do not like, in a correspondence such as this is, to see an animus such as Mr. C. displays to every one who does not think with him (and, at the same time, he does not give his own ideas as to size and shape). What really animates Mr. Nelles, I should say from his correspondence, is to get what is the right standard, and I think he is on the proper course.

The modern cocker is drifting into unknown waters where the soundings have not been taken, and I fear if Mr. Nelles and others interested do not use the lead the "bark" of the cocker will be wrecked among the crocodiles, weasels, double-action Skyes, etc. "Uncle Dick" is right; the standard is right, but judges and the public are wrong, and are taking away both symmetry and usefulness from the cocker spaniel.

M. B.

Editor Forest and Stream:

If, as Mr. Charlesworth says, his sole reason for attacking Mr. Osborne was to take him to task for his attack upon Mr. Kirk, I should have been the last one to make any mention of it, or at least only praised him in so doing, as all who know our gentlemanly judge are aware that he conscientiously makes his awards to those he considers deserve them, without fear or favor. But as nearly half of Mr. Charlesworth's letter—and that the first half—consisted in a personal attack upon Mr. Osborne because he ventured to praise his own dogs in particular and Mr. Fellows's in general; his reason was not very apparent.

I am with Mr. Charlesworth that "the cocker as recognized to-day is a handsome dog, hardy, plucky and intelligent," but the question I am agitating and to which I beg him to confine himself is: Can they work? Mr. Charlesworth says they can. I say they cannot and I have proved it and can prove it again, not on paper, but in the field. I have frequently gone out for a day or two with a couple of my prize winners, together with one or two leggier dogs and if the ground has been rough and the brush thick the former have invariably been found at heel before the day is half over and so fagged out that one could not have the heart to force them on again.

Mr. Charlesworth says: "For mixed work, or retrieving from the water, we should use a different kind of dog." I would direct his attention to "Stonehenge," and he will find in the description of the dog we are now discussing: "This dog is now expected to be the servant-of-all-work to the shooter, and takes his turn at rabbits, pheasants, or even partridges, when he is called upon, with the greatest zest." Could any one find more mixed or varied work than this? I am sorry Mr. Charlesworth finds himself unable to accept Mr. Osborne's challenge, not that I would care to have our Canadian dogs beaten by the Detroiter, but because it would be the surest and quickest way to show him his error, and win one more to our side. But I was forgotting he "breeds cockers simply for the love of them," and he would no doubt be another example of the "man convinced against his will." But this love of his must have grown amazingly within the last six months, when, in reply to my asking if he would sell a certain dog, he said, "Yes; I will sell anything I have if I get my price."

Most certainly I alluded to the American Spaniel Club, and as a member of that institution I consider that I have a perfect right to speak on the matter, and shall continue to do so, notwithstanding any man's opinion that I am "not wanting in assurance."

I am accused of being "ready to cast aside my prize winners and breed anything that people ask for," whereas it is simply this—I always have, and always will, endeavor to have the best dogs in the country, and as our shows are held for the purpose of deciding the merits of our dogs, the judges having the power of placing one strain or type above another, their decisions being considered final by the public at large, therefore I shall endeavor to keep pace with them, and as long as they champion the cause of our short-legged dogs, just so long will I continue to breed them. But should they see fit to recognize a leggier dog then I shall feel in duty bound to alter my strain until it again meets with their approval and comes again to the top. But how a man can consistently charge me with being mercenary for advocating a change that will clearly throw my present kennel—or a part of it—out of both the market and the ring, thus wasting the time and money I have already spent in bringing them to their present high standard, is more than I can understand. I cannot agree with Mr. Charlesworth that I have no ideal, most certainly I have one, but it is not the modern show cocker. My former letter showed that I had most decided ideas of my own on the subject and was not afraid to say so.

As regards feather I say again that the American standard allows more scope in this direction than the English, for while the latter distinctly warns us against its being too profuse the former gives no such warning, thus leaving a loophole which many are abusing by breeding dogs with too much feather, which in the field is anything but an advantage. And over and over again at the shows during the past season have I seen judges laying stress upon this point and allowing profuse feathering to count for the dog, and vice versa. But it is not a question of one standard against another, but simply this, is the cocker of the future to be a working dog, or a house dog and a pet, or are we to have two types, one to fill each bill?

The object of my former letter as I stated was purely to improve our present type of dog and bring him into the field again, which is his proper place. But if Mr. Charlesworth wants to continue to breed a house dog let him do so by all means, but he need not play the dog in the manger by trying to prevent our bringing about a change, for he tells us he is quite content to breed for his own pleasure and no doubt he will in a few years give us the fruits of his labor and present us with a "Charlesworth spaniel," thus handing his name down to doggy posterity. I have no objections I am sure to

his following his own heart's desire in this respect, and when he has attained this end will be proud of him as a brother Canadian breeder.

If Mr. Charlesworth can abstain from personalities and discuss the merits and demerits of the dogs, he will be doing them good, but as long as he continues to attack any one raising their voices he is only doing himself and them injury.

I know Mr. Fellows called the attention of our breeders to the state into which we were drifting some time ago and without much effect. But I think that now there are more who are willing and anxious to see a change, unless they are afraid of the effect such a change would have upon their pockets. And unless something is done and that soon the cocker will be unknown in the field and his usefulness gone.

CHAS. M. NELLES.

BRANT COCKER KENNELS, Brantford, Oct. 10.

STAFFORD DOG SHOW.

STAFFORD SPRINGS, Conn., Oct. 15.—*Editor Forest and Stream:* The fourth annual dog show of the Stafford Kennel Club was held last Wednesday and Thursday in connection with the fair of the Tolland County Agricultural Society. There were 156 entries and nearly all of them were present. The quality in many of the classes was excellent, and take the show all through it would compare favorably in this respect with any of its size that I have attended. The English setters were especially good. The pointers were also above the average, and there was a nice lot of spaniels. Mr. Thayer's exhibit was greatly admired, many of the visitors never having seen a well bred deerhound or bulldog before. The Blackstone and Rosecroft kennels made a fine showing of English setters. Mr. Tallman had charge of the feeding, using the new Blackstone prepared food, which the dogs appeared to relish and thrive on. Mr. Taliman was also of great assistance in running the show, as in the absence of Mr. Hicks there appeared to be no one to attend to many of the necessary details. Mr. H. Clay Glover, of New York, judged the pointers and setters; Mr. Thos. Dawson, of New York, the remaining sporting classes, and Dr. Geo. Walton, of Boston, the non sporting classes. The latter gentleman also acted as veterinarian. Rather a queer incident was the disqualification for mange of a dog owned by a veterinary surgeon. The judging was generally satisfactory, although Dr. Walton made a mess of it in placing the bulldog Remus over both Britomartis and Robinson Crusoe, to say nothing of his awarding prizes to brindle and brindle and white bull-terriers. The judging was done outdoors without any ring, and so great was the crowd that it was only by hard work that the judges could get at the dogs. Following is a list of the

AWARDS.

MASTIFFS.—*Dogs:* 1st, A. Robert's Moses. *Bitches:* No entries

ST. BERNARDS.—ROUGH-COATED—*Dogs:* 1st, H. S. Pitkin's Prince Barry; 2d, Chequasset Kennels' Monte Rosa. *Bitches:* No entries. *Puppies:* Withheld.—SMOOTH-COATED—CHAMPION—Absent.—OPEN—*Dogs:* 1st, Chequasset Kennels' Lodi. *Bitches:* No entries. *Puppies:* 1st and 2d, Chequasset Kennels' Norman and Nora.

DEERHOUNDS.—1st, 2d, very high com. and high com., J. E. Thayer's Bran, Lorna II., Duncan and Thora.

POINTERS.—LARGE—*Dogs:* 1st, S. T. Colt's Rob Roy II. *Bitches:* 1st, J. W. Trantum's Daisy Ranger; 2d, S. T. Colt's Phyllis. Very high com., S. Ferry's Snap. Com., Don Quixote Kennels' Roxy Vera.—SMALL—*Dogs:* 1st, R. Leslie's Spot Dash; 2d, Don Quixote Kennels' Don Quixote. High com., F. L. Nichols' Snyder. *Bitches:* 1st, T. H. Terry's Modesty; F. L. Nichols' Black Bessie. Very high com., Don Quixote Kennels' Nell. High com., J. O'Neil's Fan. *Puppies:* 1st, Don Quixote Kennels' unnamed; 2d, very high com. and com., S. Ferry's Snap, Monarch and Mack.

ENGLISH SETTERS.—CHAMPION.—Blackstone Kennels' Royal Albert.—OPEN—*Dogs:* 1st, Rosecroft Kounels' Fairy King; 2d, Blackstone Kennels' Don Petrel. *Bitches:* 1st, Blackstone's Kennels' Foreman's Lass; 2d and very high com., Rosecroft Kennels' Forest Dora Passion and Alice Gray. High com., W. Perrall's Flora. *Puppies:* 1st, Blackstone Kennels' Pirate.

BLACK AND TAN SETTERS.—CHAMPION.—F. M. Morris's Tom.—OPEN—*Dogs:* W. G. Drew's Heather Jock. *Bitches:* 1st, G. E. Browne's Jessica.

IRISH SETTERS.—*Dogs:* 1st, C. W. Rodenburg's Chip; 2d, H. A. Fisher's Arrowwanna. Very high com., E. L. Rogers's Lord Elcho. *Bitches:* 1st and 2d, Watkins & Cheeney's Perdita and Nora V. *Puppies:* 1st and 2d, Watkins & Cheeney's Teddy and Molly.

FIELD SPANIELS.—1st and 2d, W. O. Partridge's Rob and Critic.

COCKER SPANIELS.—*Dogs:* 1st and 2d, W. A. Segar's Single Sin and Balfour of Burley. *Bitches:* 1st, W. O. Partridge's Bessie; 2d, E. S. Bird's Dolly Obo. *Puppies:* Prizes withheld. Com., E. S. Bird's Had Had.

FOXHOUNDS.—Not for competition.

BEAGLES.—CHAMPION—Spring Brook Kennels' Bounce.—OPEN—*Dogs:* 1st and 2d, Linden Beagle Kennels' May Belle II. and Norah.

FOX-TERRIERS.—CHAMPION—J. E. Thayer's Belgrave Primrose.—OPEN—*Dogs:* 1st, J. E. Thayer's Raby Jack. *Bitches:* 1st, J. E. Thayer's Richmond Myrtle. *Puppies:* 1st and 2d, J. E. Thayer's Fraulein Mixture and Raby Bounce.

BULLDOGS.—CHAMPION—J. E. Thayer's Remus.—OPEN—1st, 2d and very high com., C. D. Cugle's Soudan, Merry Monarch and Tostig.

BULL-TERRIERS.—CHAMPION—Absent.—OPEN—*Dogs:* 1st, W. Remant's Jim; 2d, D. H. Parsons's Sport. *Bitches:* 1st, J. Mack's Fan. *Puppies:* 1st and 2d, A. W. Bill, Jr.'s two unnamed.

ROUGH-HAIRED TERRIERS.—Absent.

BLACK AND TAN TERRIERS.—Myra Smith's Pet.

PUGS.—CHAMPION—Chequasset Kennels' Young Toby.—OPEN—*Dogs:* 1st, Chequasset Kennels' Chequasset Diamond. *Bitches:* 1st and 2d, Chequasset Kennels' Tra-la-la and Victory.

YORKSHIRE TERRIERS.—Absent.

SPECIAL PRIZES.

Kennel St. Bernards, Chequasset Kennels; pointers, Don Quixote Kennels; English setters, divided between Blackstone and Rosecroft Kennels; spaniels, E. S. Bird; fox-terriers, J. E. Thayer; pugs, Chequasset Kennels; deerhounds, J. E. Thayer; Irish setters, Watkins & Cheeney; bulldogs, J. E. Thayer.

SPECIAL.

EASTERN FIELD TRIALS.—Mr. D. C. Bergundthal has consented to judge at the coming field trials of the Eastern Field Trials Club. Quail are reported to be more abundant on the grounds of the club than on any previous year and trials will not drag from lack of birds. Many of the trainers have already taken their dogs south and others will soon follow. We should be pleased to have every handler send his address to this office with a list of the dogs under his care.

THE COLLIE CLUB ANNUAL MEETING.—Notice is hereby given that the annual meeting of the members of the Collie Club of America will be held at the office of Thos. H. Terry, Esq., 44 Broadway, New York, on Tuesday, Nov. 22, 1887, at 3:30 P. M. All members are requested to be present. —MARTIN DENNIS, Secretary, pro tem.

INDIANA KENNEL CLUB.—Several valuable special prizes have been donated to the Indiana Kennel Club for the winners at their first annual field trials. The prospect is good for a very interesting meeting, many of the best dogs in the State will compete and a large attendance of visitors is expected.

THE COLLIE CLUB SWEEPSTAKES.—The competition for the semi-annual sweepstakes of the Collie Club will be held on Wednesday, Nov. 16, 1887, at the Chestnut Street Rink, Twenty-third and Chestnut streets, Philadelphia, Pa. Judging will begin promptly at 2 P. M.

DANBURY DOG SHOW.

Editor Forest and Stream:

The usual dog show was held in connection with the fair at Danbury on Oct. 4 to 7. The entries numbered close upon two hundred, and were well benched and looked after by Mr. Herbert Mead, the well known breeder of mastiffs. The exhibits were of a very superior character, and but for the lack of publicity given the show and the premium list, the show would have taken much higher rank. The judging was done by Mr. James Watson, of Philadelphia, who gave very general satisfaction. Following is a list of the

AWARDS.

MASTIFFS.—*Dogs:* 1st, G. E. Sear's Kaiser; 2d, P. Hornig's Sultan. Com., E. J. Hawley's Bruno. *Bitches:* 1st and 2d, H. Mead's Aydah and Fairy. *Puppies:* 1st and 2d, H. Mead's two unnamed, by Minting out of Aydah.

FOX-TERRIERS.—*Dogs:* 1st and 2d, J. E. Thayer's Raby Jack and Belgrave Primrose. Com., Dr. C. I. Bailey's Handy Mixture. *Bitches:* 1st and 2d, J. E. Thayer's Lyra and Richmond Myrtle. *Puppies:* 1st and com., Dr. C. I. Bailey's Mt. Toby Flirt and Mt. Toby Primrose; 2d, J. E. Thayer's Raby Bounce.

COLLIES.—*Dogs:* 1st, Lothian Kennels's Lothian Chief; 2d, T. Aitkin's Clyde. *Bitches:* 1st, A. R. Kyle's Clio; 2d, Lothian Kennels' America. Com., A. R. Kyle's Juno II. *Puppies:* 1st, A. R. Kyle's Clio; 2d, Lothian Kennels' Lothian Maid.

BULLDOGS.—*Dogs:* 1st and 2d, Capital City Kennels' Merry Monarch and Tostig. *Bitches:* 1st and com., Capital City Kennels' Soudan and Beatrice; 2d, J. E. Thayer's Carmon. *Puppies:* 1st, Capital City Kennels' Beatrice.

BULL-TERRIERS.—*Dogs:* 1st withheld; 2d, Sunnyside Kennels' Tony.

BLACK AND TAN TERRIERS.—*Bitches:* 1st, Dr. W. F. Lacy's Bounce.

TOY TERRIERS.—1st, Mrs. B. C. Lynes's Cosette.

POODLES.—1st, W. Scott's Fido.

DEERHOUNDS.—*Dogs:* 1st, J. E. Thayer's Duncan. *Bitches:* 1st, J. E. Thayer's Brazen.

POINTERS.—*Dogs:* 1st, D. Scott's Ned; 2d, F. Fellon's Dick. *Bitches:* 1st, J. Coughlin's Bessie; 2d, J. R. Borraclough's Flycatcher. Com., J. C. Tautcay's Belle. *Puppies:* 1st, E. S. Treadwell's Dark; 2d, H. D. Collins's unnamed. Com., F. E. Hyde's, J. Coughlin's and J. R. Barraclough's unnained.

ENGLISH SETTERS.—*Dogs:* 1st, G. W. Neal's Pride of Orleans; 2d, J. G. Whitney's Governor. Com., Warwick Kennels' Shot. *Bitches:* 1st, G. W. Neal's Daisy Foreman; 2d, Miss H. Tracy's Midget. *Puppies:* 1st and 2d, Warwick Kennels' two unnamed.

GORDON SETTERS.—1st, withheld; 2d, R. B. Pierce's Nip. *Bitches:* Prizes withheld. *Puppies:* 1st, withheld; 2d, T. H. Robinson's unnamed.

FIELD SPANIELS.—*Dogs:* 1st, W. Scott's Pearl Lake Obo; 2d, C. Phillip's Ned. *Bitches:* 1st, W. Scott's Black Flash; 2d, L. H. Harboch's Belle. *Puppies:* 1st and 2d, W. Scott's unnamed.

COCKER SPANIELS.—*Dogs:* 1st and 2d, American Cocker Kennels' Doc and Dixie. *Bitches:* 1st and com., W. Scott's Susie and Flirt and Jennie; 2d, American Cocker Kennels' Queen Obo. *Puppies:* 1st and com., W. Scott's unnamed; 2d, Warwick Kennels' unnamed.

FOXHOUNDS.—*Dogs:* 1st, J. Baldwin's Frank. *Bitches:* 1st, F. Woodruff's Minnie.

BEAGLES.—1st, withheld; 2d, G. Laick's Rattler.

DANBURY.

WOOSTER DOG SHOW.

WOOSTER, O., Oct. 10.—*Editor Forest and Stream:* The dog show held at this place last week by the Wayne County Agricultural Society was a very good one for a first attempt. There were over 180 dogs entered and some of them were very good specimens. So much interest was manifested in the show that the society will probably make it a regular fixture at their annual fair. The dogs were exhibited under a large tent and were constantly surrounded by an admiring crowd. Mr. John Bolus had charge of the show and performed his duties in a manner most satisfactory to all. Mr. Carl E. White, of Cleveland, judged all classes. Following is a list of the

AWARDS.

ENGLISH SETTERS.—*Dogs:* 1st and 2d, J. Bolus's Blue Dick and Briton. *Bitches:* 1st and 2d, J. Bolus's Bennie and Blue Dick's May.

GORDON SETTERS.—1st, F. J. Hayden's Nankipoo.

IRISH SETTERS.—Prizes withheld.

POINTERS.—*Dogs:* 1st, J. Bolus's Lincolnshire Lad; 2d, J. H. Law's Royal Croxteth. *Bitches:* 1st and 2d, J. Bolus's Trinket and Lady Osborn.—PUPPIES—*Dogs:* 1st, J. Bolus's Trinket's Champion; 2d, C. Gearing's Clyde. *Bitches:* 1st and 2d, J. Bolus's Bondine and Lady Coin.

FOXHOUNDS.—*Dogs:* 1st, D. Atkins's Dime; 2d, J. Brant's Piper. *Bitches:* 1st, C. B. McFarland's Belle; 2d, J. Kepfer's Lucy.—PUPPIES—*Dogs:* 1st, J. M., Shafer's Prince; 2d, C. B. McFarland's Spotted Belle. *Bitches:* 1st, J. Kepfer's Ruth; 2d, C. B. McFarland's Sis.

BEAGLES.—*Dogs:* 1st, Hollywood Kennels' Bugler. *Bitches:* 1st, Hollywood Kennels' Bonnie.

DEERHOUNDS.—*Dogs:* 1st, W. H. Mullin's Custer.

GREYHOUNDS.—*Dogs:* 1st, J. Long's Denver.

COLLIES.—*Dogs:* 1st, J. Jones's Bill; 2d, F. Frank's Roger. *Bitches:* 1st, J. Jones's Spry; 2d, J. Thomas's Belle.—PUPPIES—*Dogs:* 1st, F. Frank's Snipe; 2d, J. Jones's George. *Bitches:* 1st, J. Jones's Flirt; 2d, F. Frank's Shep.

FOX-TERRIERS.—1st, Dr. E. V. McLean's Tartar; 2d, S. Bell's Spot.

BULL-TERRIERS.—*Dogs:* 1st, J. Johnson's Turk. *Bitches:* 1st, J. M. Shafer's Sis.

BLACK AND TAN TERRIERS.—*Dogs:* 1st, Hollywood Kennels' Dandy.

TOY TERRIERS.—1st, J. Bolus's Dixey.

SPECIAL PRIZES.

Best English setter, J. Bolus's Briton; pointer puppy, same owner's Trinket's Champion; kennel foxhounds, Kilbuck Fox Hunting Club; kennel collies, J. Jones's.

WOOSTER.

THE AMERICAN FIELD TRIALS.—Entries are coming in satisfactorily for the first annual field trials of the American Field Trial Club, a larger number having already been received than were entered at the National last year. Twelve States are represented in the list, Arkansas, Connecticut, Kentucky, Maine, Mississippi, Missouri, New Jersey, New York, Ohio, Pennsylvania, Tennessee and Wisconsin. The platform of the association is worthy the support of every dog owner throughout the country, and in no better way can this support be given than by making the list of entries convincing proof that the endeavors of the gentlemen composing the organization "to put field trials upon a higher plane" are appreciated, and that their hands will be held up by right-minded sportsmen in the good work of reform which they have undertaken. Entries close Nov. 1 and should be sent to the secretary, Mr. C. W. Paris, Cincinnati, O.

PHILADELPHIA DOG SHOW SWEEPSTAKES.—*Editor Forest and Stream:* Our club proposes to hold, in connection with our spring show, a series of sweepstakes open to all dogs whelped in 1887 in following classes: Mastiffs, St. Bernards, English and Irish setters, pointers, fox-terriers, collies, spaniels, and probably one or more other classes. Entries for these sweepstakes will close Dec. 1. Entry blanks, etc., can be had of WM. H. CHILD, Sec'y.

MR. H. B. WILSON, the well-known secretary of the New Brunswick Kennel Club, has left his home in St. John, N. B., for a permanent residence in Los Angeles, Cal. His many friends will join with us in wishes for his prosperity.

COLUMBUS DOG SHOW.—Columbus, O., Oct. 10.—*Editor Forest and Stream:* The second annual bench show of the Ohio Poultry and Kennel Association will be held in Columbus Jan. 10 to 12, 1888. From present indications this will be one of the best ever held in this county. Our premium list, which is a good one, will soon be out. Major J. M. Taylor will judge sporting classes, Mr. H. C. Goodwin non-sporting, Geo. A. Hill, Superintendent, H. A. Bridge, Secretary.—W. F. KNELL.

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Eloise. By C. G. Wheelock, Arlington Heights, Mass., for white and orange St. Bernard bitch, whelped Dec. 28, 1886, by Hector (A.K.R. 3249) out of Bessie (Barnard's Prince—Nelly).

Glen Tempest, Glen Mack, Glen Monarch and Glen Duke. By G. F. Clark, St. George's, Del., for three lemon belton and one black, white and tan English setter dogs, whelped Sept. 8, 1887, by Glen Rock (A.K.R. 1616) out of Countess Flirt (A.K.R. 3040).

Glen Dart, Glen Fairy, Glen Flirt and Glen Ruby. By G. F. Clark, St. George's, Del., for two lemon belton and two black, white and tan English setter bitches, whelped Sept. 8, 1887, by Glen Rock (A.K.R. 1616) out of Countess Flirt (A.K.R. 3040).

Collier. By E. S. Bettelheim, Bath Beach, N.Y., for red Irish setter dog, whelped April 18, 1887, by Gunner (A.K.R. 3637) out of ——.

Nydia. By Dr. Geo. B. Ayres, Omaha, Neb., for fawn, black points, mastiff bitch, whelped July 5, 1887, by King of Ashmont out of Ashmont Queen (Major—Clio).

Berran Kennels. By E. S. Bettelheim, Bath Beach, N. Y., for his kennels.

NAMES CHANGED.

Violet to Nellie Bly. Liver and white pointer bitch, whelped May 15, 1887, by Stoddard's Bodine (Bow—Jaunty) out of Dubois's Fleet (Dash—Spot), owned by E. K. Leffingwell, Brooklyn, N. Y.

Maude to Maude M.—Editor Forest and Stream: When claiming the name Maude some time ago for Clumber spaniel bitch by Johnny out of Jess, I forgot that Capt. Viette had already claimed that name for bitch by Johnny out of Madge. I would like to change the name to Maude M.—F. H. F. MERCER (Ottawa, Ont., Oct. 15).

BRED.

☞ **Notes must be sent on the Prepared Blanks.**

Nettie B.—Belthus. John E. Long's (Brooklyn, N. Y.) English setter bitch Nettie B. (Mark—Belle) to H. F. Schellhass's Belthus (Rock—Meg), Sept. 24.

Busy—Brant. J. D. G. Shaw's (Kingston, Ont.) cocker spaniel bitch Busy (Mike—Nancy) to Brant Cocker Kennels' Brant (A.K.R. 5389), Sept. 25.

Belle Reta—Spot Dash. E. B. Eames's (Reading, Mass.) pointer bitch Belle Reta (Baronet—Rita Croxteth) to Robert Leslie's Spot Dash (Sir Phillip Sydney—Topsy), Aug. —.

WHELPS.

☞ **Notes must be sent on the Prepared Blanks.**

Bizorena. Onota Kennels' (Pittsfield, Mass.) Irish setter bitch Bizorena (A.K.R. 2876), Oct. 13, eight (four dogs), by Max Wenzel's Chief (A.K.R. 231).

Red Belle. John Hitchcock's (Sing Sing, N. Y.) Irish setter bitch Red Belle (Gleneho—Tara), Sept. 3, ten (five dogs), by Wm. H. Pierce's Sarsfield (Garryowen—Currer Belle II.).

Maud. Mill Brook Kennels' (Waverly, Md.) St. Bernard bitch Maud (Dirk—Abra), Oct. 3, seven (three dogs), by J. H. McHenry's Leo (Hero—Lucy).

Friza. Mill Brook Kennels' (Waverly, Md.) St. Bernard bitch Friza (Duke of Leeds—Dido II.), Sept. 6, two (one dog), by Hospice Kennels' Otho (Rollo—Lady Abbess).

Bertha. Mill Brook Kennels' (Waverly, Md.) St. Bernard bitch Bertha (Bruno, A.K.R. 417—Elsa, A.K.R. 411), July 18, six (one dog), by St. Bernard Breeding Club's Apollo (Medor—Blass).

Portia. John Coles's (Linden, Mass.) mastiff bitch Portia (A.K.R. 3563), Oct. 9, six (three dogs), by Tiot Kennels' Bruce (A.K.R. 4649).

Fairy II. L. Gardner's (Mt. Vernon, N. Y.) pointer bitch Fairy II. (A.K.R. 4387), Oct. 10, nine (five dogs), by W. Crawford's imported Pilate (Lord Sefton's Bang—Lord Sefton's Nora); one since dead.

Topsey Logan. F. C. Rochester's (Logan, O.) pug bitch Topsey Logan (A.K.R. 4271), Oct. 7, four (two dogs), by Geo. H. Hill's Joe (A.K.R. 925).

SALES.

☞ **Notes must be sent on the Prepared Blanks.**

Grant. Brindle and white St. Bernard dog, whelped Dec. 14, 1886, by Berg out of Friza, by Mill Brook Kennels, Waverly, Md., to W. A. Sudduth, Flemingsburg, Ky.

Guard. Fawn and white St. Bernard dog, whelped Dec. 14, 1886, by Berg out of Friza, by Mill Brook Kennels, Waverly, Md., to C. S. Husted, Rye, N. Y.

Moselle. Orange and white St. Bernard dog, whelped Oct. 22, 1886, by Rudolph II. out of Heidel, by Mill Brook Kennels, Waverly, Md., to Miss Lillian Olcott, Brooklyn, N. Y.

Ajax. Orange and white St. Bernard dog, whelped May 15, 1886, by Verone out of Nellie, by Mill Brook Kennels, Waverly, Md., to W. C. Freeman, Cornwall, Pa.

Granit. Brindle and white St. Bernard dog, whelped Dec. 14, 1886, by Berg out of Friza, by Mill Brook Kennele, Waverly, Md., to Arnold Thayer, Roslyn, L. I.

Frair. Tawny white St. Bernard dog, whelped March 15, 1887, by Rudolph II. out of Maira, by Mill Brook Kennels, Waverly, Md., to J. C. Berry, Shreveport, La.

Hasty. Red sable and white collie dog, whelped Sept. 3, 1886, by Gordon out of Thule, by Mill Brook Kennels, Waverly, Md., to Dr. A. Cumie, Englewood, N. J.

Twinkle. Seal brown collie dog, whelped Sept. 3, 1886, by Gordon out of Thule, by Mill Brook Kennels, Waverly, Md., to E. C. Freeman, Cornwall, Pa.

Shepperd. Black and tan collie dog, whelped Nov. 13, 1885, by Laddie out of Jean, by Mill Brook Kennels, Waverly, Md., to H. L. Sherman, Lake George, N. Y.

Asa. Light orange and white St. Bernard dog, whelped May 15, 1886, by Verone out of Nellie, by Mill Brook Kennels, Waverly, Md., to H. A. Thomas, Scranton, Kan.

Dwight. White and tawny St. Bernard dog, whelped May 11, 1886 by Verone out of Bertha, by Mill Brook Kennels, Waverly, Md., to Samuel Nave, St. Joseph, Mo.

Belle Reta. Liver and white pointer bitch, age not given, by Baronet out of Rita Croxteth, by Frank Killain, Topsfield, Mass., to E. B. Eames, Reading, Mass.

Busy. Black cocker spaniel bitch, whelped June, 1885, by Mike out of Nancy, by Dr. J. S. Niven, London, Ont., to J. D. Shaw, Kingston, Ont.

Guy and Ferrol. Orange and white St. Bernard dog and bitch, whelped Nov. 30, 1886, by Colonel out of Lady May, by Mill Brook Kennels, Waverly, Md., to G. B. Earl, Englewood, N. J.

Darkie (A.K.R. 1000)—Flo whelps. Field spaniels, whelped May 12, 1887, by Dr. J. S. Niven, London, Ont., a liver dog to W. C. F. Gill and a black dog to R. Bland, both same place.

Flirt. Liver and white pointer bitch, whelped June 15, 1887, by Nick of Naso (A.K.R. 4391) out of Nan (A.K.R. 355), by James P. Swain, Jr., Bronxville, N. Y., to Albert L. Rountree, Kinston, N. C.

Gipsey. Lemon and white pointer bitch, June 15, 1885, by Nick of Naso (A.K.R. 4391) out of Nan (A.K.R. 355), by Jas. P. Swain, Jr., Bronxville, N. Y., to Dr. Chas. W. Sanders, Jr., New York.

Nick of Naso (A.K.R. 4391)—Nan (A.K.R. 355) whelp. Liver and white pointer dog, whelped June 15, 1887, by Jas. P. Swain, Jr., Bronxville, N. Y., to Chas. J. Peshall, Jersey City, N. J.

PRESENTATIONS.

Darkie (A.K.R. 1000)—Flo whelp. Black field spaniel dog, whelped May 12, 1887, by Dr. J. S. Niven, London, Ont., to J. T. Macbeth, Cleveland, O.

DEATHS.

Aileen. Wheaten Irish terrier, 6yrs. old (Dash—Kitty), owned by Dr. J. S. Niven, London, Ont.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

G. K., Brooklyn.—My four puppies when trying to walk shake all over, standing only on their toes, then fall flat on the ground, ise up again and try to walk further with the same result; open heir mouths wide, tongue protruding. Attacks last from two to

four minutes. After about ten days the worst case became so bad as not to be able to walk, and crying with pain. I have given them a solution of quinine, nux vomica and port wine, from 5 to 10 drops three times a day. Ans. Your puppies have worms. Give each a teaspoonful of castor oil, and four hours later a teaspoonful each of olive oil and 5 drops of turpentine. This may be repeated the following day if necessary.

T. C. A. Morristown.—Bull bitch snores very much, and seems to breathe with an effort; this has been the case since she was a pup. She is not fat, and except for his breathing is in perfect health. Ans. It is impossible with the meagre details you give to say. Consult a veterinary.

Rifle and Tray Shooting.

RANGE AND GALLERY.

THE NATIONAL ENCAMPMENT.

CHICAGO, Sept. 13.—The day at the National encampment was devoted to rifle competitions, and all interest was centered in that. The rifle range has been put up in excellent shape, considering that it is only for temporary use. There are eight targets of the improved Laidley pattern, and the distances are 200, 300, 500 and 600yds. There are five competitions, and some of the best shots in the regular army and National Guard are entered. Besides this there are teams from Norway, Sweden, and Denmark entered in the all-comers matches. The States represented by teams are, Maryland, Massachusetts, New York, Ohio, Illinois, Wisconsin, New Jersey, and Minnesota. The opening contest consisted of ten shots for each man at each of the three ranges, and the result shows the number of points out of a possible 50 at each range, or a possible 150 for the three ranges. The total team scores are points made out of a possible 500 at each range, or 1,500 for the three ranges.

There was a team of Indians, and while nobody but a dime-novel reader expected, or rather hoped, that there would be a genuine scalping bee, everybody looked forward to yesterday, the beginning of the rifle practice, hoping to see some marvelous rifle practice fr m the "original inhabitants." The latter are members of the National Guard of New Mexico, and are armed with carbines of Springfield make, but of an old pattern and with short barrels. When the team shooting began—ten shots each man at 200, ten at 500 and ten at 600yds.—the Indians had the left flank of the teams. There was but a small crowd of spectators, but inasmuch as these were all more or less versed in rifle practice, one can easily imagine the surprise when the red flag kept almost constantly waving in front of the red men's target, indicating that they were missing even the target of generous size. For the 200yd. range standing was the position described; any other position was permissible for the longer ranges. The Indians did not complete even the 200yds. range shooting. They dropped out before their hundred shots were fired. This left four teams in the field—the First Minnesota, Fifth Iowa regiments, First Michigan State Troops and Second Maryland Regiment, the famous Haymakers. The team alleged to be from the Second Massachusetts Regiment was ruled out because it was discovered that the men had been selected from eight different regiments. The score made was as follows:

Second Maryland, Prize $200.

Lieut. Jackson, U. S. A., was in charge of the range, assisted by Lieut. Defrees. The latter is captain of the regular army rifle team from the Department of the Missouri, which will come into play in the remaining part of the programme. Then the Haymakers will have to face the crack shots of the army as well as the Massachusetts men, who have some of the best riflemen in the world in their ranks. Colonel Wardwell of the Marylanders, is a sight to see at the range. He hovers over his men as a chicken does over her brood, and every mediocre shot—poor shots the Haymakers scarcely make—can be discovered by a glance at his face, so to speak. No member of the team can feel a "two" or "three" as keenly as the good-natured Colonel does.

Most of the men took the "Texas grip," which is a perfectly recumbent position, and recoil of the gun being moderated by the left leg resting in the gun strap and the rifleman having the butt on top of the right shoulder. But one of the men, a member of the Michigan team, shot "prone," that is, lying on his breast with his face to the target. A Minnesota man shot lying on his back, but with the butt of his gun hard on the shoulder. One of the Haymakers had just prepared a nice little artificial rest for his legs by doubling up his overcoat under him, and another rested his left foot against the range stub. In both instances Colonel Wardwell promptly ordered the men to comply with the rules which prohibit any artificial rest.

The Iowa men have rifles of a pattern which is five or six years old, which, in view of the rapid improvements of firearms, may be termed an ancient patttern. The regular army is not much better off. The fact that no warming shots are allowed is another matter of great importance, and even the position at the range counts. The Haymakers had the Blaine position, that is, the one to windward, so that the smoke of their rifles was carried across the shot line of the other teams, while they themselves had a clear range.

Oct. 14.—The rifle contests continued all day at the West Side encampment. There is very little of the encampment left, but the marksmen cared little for that, and kept blazing away at the targets from 9 o'clock in the morning until sundown. There was only a very small crowd in attendance, although the rifle practice is the only part of the big show which has not fizzled out. The contests were for the individual competition and the all-comers' team shoot.

In the individual competition there were 102 entries. It was at 200yds., off-hand, 15 shots to a man, and open to marksmen from all the world. Several of the Scandinavians shot, but failed to make much of a showing. The first prize was won by W. M. Farrow, of Massachusetts, and one of the celebrated American team which went to England. He is a member of the Massachusetts volunteer team, and so are A. C. White, C. W. Hinman and M. H. Bull, who captured the second, third and fifth prizes respectively. A. W. Stray, of the United States Army, slipping into fourth place. Following is the complete score:

The individual shoot was finished by 12 o'clock, and then began the all-comers' team shoot, open to teams of men each from the United States or foreign counties, provided each team in the United States was made from men from one State. Ten shots were allowed each man at 200, 300, 500 and 600yds. The shooting was finished only at the 200 at 300yds. ranges. Part of the 500yds. range was shot, but darkness put a stop to the contest.

Seven teams engaged in the competition, which will result in the winning team taking $1,000 in cash and $500 worth of badges; second $500, third $250, fourth $125, and the fifth $100.

Oct. 15.—Following is the complete score in the All-Comers' rifle team competition begun at the military encampment yesterday:

	200	300	500	600	Total.
Massachusetts 2d Brigade	451	414	450	438	1704
U. S. A., Dept. Missouri	437	451	436	352	1676
First Minnesota	430	438	417	341	1628
Maryland Haymakers	414	415	432	322	1583
Twenty-third Infantry U. S. A	401	383	439	336	1559
Fifth Iowa	402	386	419	350	1557
First Michigan	414	395	386	297	1492

ALBANY, Oct. 7.—The tenth annual fall meeting of the Third Division Association which ended at Rensselaerwyck to-day was the most successful ever held in the history of the organization. To the efforts of Secretary Buel C. Andrews and Major C. H. Gaus, as executive officers, much of the success of the affair is due.

The scores in detail are given below. In the team match the local Tenth Battalion came off with flying colors, overcoming the Twentieth Separate Company, of Binghamton, the Sixth, of Troy, and the Eighteenth, of Glens Falls. A year ago they beat Binghamton's crack shots by a single point, but this year the majority was increased to five. Thursday a strong wind prevailed and the light was fair, while to-day the wind was light and the smoke hung on the range. Under these conditions the shooting occurred.

The Tenth Battalion team, who won the brigade championship match, received a trophy valued at $100 from the State. In the first match the prize was $10, in the second a costly bronze, in the third the champion marksman's badge of the Third Brigade, in the fourth a gold medal, in the sixth a gold medal, and in the seventh a Smith & Wesson revolver.

Match No. 1.—Short range continuous military match, open to all comers, 200yds., shots seven, the aggregate of best two scores to count; standing and off hand; military rifles; 101 entries. Following leading scores were made:

Col W E Fitch	5445454—31	4544555—32—63
J J Mills	3445555—31	4545554—32—63
B R Spelman, Jr	5444545—31	4544455—31—62

Sergt Gordon, 22d Bat	34	Col Lewis, retired list	30

Oct. 14.—The Western District rifle matches closed to-day.

In the Volunteers' match, 400 and 500yds., 5 shots each: Staff-Sergt. Wilson and N. Robson, of the 23d, took first and second, with 42 and 41; Capt. Moore, of the 25th Batt., was third, with 39; Corp. Crowe, Guelph F. B., fourth, with 39; Surgeon Corliss, of the 25th, fifth, with the same number of points.

The affiliated match, 500 and 600yds., 5 shots each, was won by John Worden, of Stratford, with 39; J. Crowe, Guelph, second, with 38; John Ogg, Guelph, third, with 38; Lieut. Mitchell, Port Elgin, fourth, with 36, and Sergt. Wilson, 33d, fifth, with 34.

The team prizes were won by the following: First, Guelph F. B., 173 points; second, 23d Batt., 153; third, 25th Batt., 138; fourth, St. Thomas Rifle Association, 133.

The aggregate match was won by C. Armstrong, Guelph, who took the D. R. A. medal with a score of 104; second, J. Ogg, O. R. A., 103; third, Lieut. Mitchell, 103; fourth, Capt. Moore, St. Thomas, 101; fifth, Col. O'Malley, 25th, 101; sixth, Lieut. Elliott, 7th, 101.

WILLIAMSPORT, Pa., Oct. 11.—The Williamsport Rifle Club turned out to-day, fourteen members participating in the sport. Following is the score at 500yds.:

Whitehead	9	5	6	9	5	7	9	9	6	8—78
Hughes	8	5	8	5	7	8	5	8	5	8—66
Colkett	6	7	5	8	5	8	9	6	4	8—66
Millspaugh	4	6	8	5	6	6	7	4	9	8—63
Barker	4	5	5	8	5	8	5	8	5	9—62
Piatt	5	5	4	7	5	7	7	5	3	10—58
Harder	8	9	5	4	4	4	9	2	6	0—57
Johnson	7	9	3	4	5	4	4	3	7	9—55
Smith	3	6	5	6	5	7	7	7	4	3—53
Hunn	6	8	3	6	4	4	6	7	2	4—50
Nielson	4	5	4	3	6	6	6	3	7	7—46
Parker	3	3	4	7	7	4	4	5	3	6—46
Rothrock	2	4	3	3	3	4	4	5	3	6—37
Wheeler	1	4	4	3	3	1	1	4	3	3—27—760

Average, 54 2-7.

At a meeting held by the club at their rooms in the evening there were sixteen new members added to their roll, making the full membership about fifty. To-day being the end of the yearly shoot, the captain of the club, Mr. N. A. Hughes, was presented with the Harder gold badge, he being the fortunate one, having carried the gold club badge the greatest number of weeks during the year.

CREEDMOOR, Oct. 15.—The 11th Marksman's Badge match was shot to-day; the attendance was very large, and the weather was good, although the heavy wind in the morning somewhat bothered the shooters, some good scores were made. S. C. Pirie, Co. I, 23d Regt., was again the winner of the gold medal, and it virtually becomes his property, he having won it three times. Following are the scores of 42 and over, the winners being marked thus *:

	200	500	T'l		200	500	T'l
*S C Pirie, I, 23d	23	24	46	*S F Fahnestock, I, 16th	18	24	42

*D Bacon, K, 7th	23	20	43				

The two last Marksman's Badge matches this season will be shot on Saturday, Oct. 29 and Tuesday, Nov. 8 (election day) entries for which can be made at the office of the N. R. A., room 55, Temple Court, 5 and 7 Beekman street, New York city.

HARTFORD, Conn., Oct. 7.—This afternoon two teams of 7 men each, competed at the Franklin rifle range for a supper. The men were members of the Foot Guard, the distance was 200yds., and each man was allowed 2 rounds of 5 shots. The scores were as follows:

Glazier	34304—14	02244—12
F Bill	42434—17	44403—15
Goodell	00000— 7	30040— 7
O Griswold	00002— 2	02223— 9
Thompson	00000— 0	30404—11
Watkinson	00020— 2	32000— 5
Clarke	32422—13—55	23424—14—73
Prutting	45453—21	33430—13
Wheeler	24350—14	33000— 6
O'Bill	00035— 6	20002— 4
Lawler	34000— 7	53423—17
Richmond	00002— 2	30223—10
Wilson	00000— 0	34334—17
Lincoln	00224— 8—58	43043—14—81

MANCHESTER, N. H. Oct. 8.—At the range this afternoon N. Johnson made a 72 card out of a possible 100 in the running prize event. He also defeated W. Graham in a match of 25 shots each, as follows:

Johnson	2 6 6 3 4 4 6 9 5 9 9 6 10 7 9 3 6 8 8 4 5 8 7 8 8—160
Graham	4 10 6 8 5 7 5 6 4 4 6 9 8 2 6 5 5 9 3 8 1 9 4 5 4—148

The proposition to hold a field day for members of the Manchester Rifle Association only, at which the present prize event, which has been running several months, shall be supplemented by half a dozen additional prizes, and terminate on that day is being discussed and is quite likely to be brought about.

MILLER RIFLE CLUB.—The fall shoot of the Miller Riffle Club will be held at Schuetzen Park, Union Hill, N. J., Monday, Oct. 24. Shooting to commence at 8 A. M. and to close at 5 P. M. The well-known rules to be in force.

THE TRAP.

Scores for publication should be made out on the printed blanks prepared by the Forest and Stream, and furnished gratis to club secretaries. Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

THE CALIFORNIA TOURNAMENT.

SAN FRANCISCO, Oct. 6.—The annual tournament of the California Sportsmen's Association opened to-day and a very large attendance of sportsmen from this city and State contested for many beautiful prizes offered, on Cunningham's pigeon grounds. The shooting began promptly at 10 o'clock. The wind was blowing pretty stiff from the north during the forenoon and toward evening it increased to a gale. It was almost impossible in the afternoon to stand in a steady position before the traps, and as the pigeons, in the majority of instances, positively refused to fly, trap-shots found it a difficult task to make anything like clean scores. The birds that did fly shot from the traps with the speed of an arrow and were in only exceptional cases stopped short in their hurried flight toward the oyster beds. The first match was at 15 live birds, 21yds. rise, regular boundary, plunge traps, use of one barrel only; 29 entries. The first prize was won by John de Vaull, Jr. The young gentlemen grassed 14 birds in grand style. Five contestants scored 13 birds. Rice handled the strings in good style and Mr. Cate gave general satisfaction in his judgments as referee of the meeting.

Biggs	1000010011111101— 8	W Golcher	0111011110111110—11
Cross	0011110111111111—12	H A Bassford	0101111011111011—11
Sherry	1110011001101111—10	A Donaldson	0111111011111111—13
Dunshee	1101111111111110—13	De Vaull, Jr	1111111111111101—14
Fay	1111111001101111—12	F Bassford	1100110111111011—11
Lane	1110010111110011—10	Walsh	0110101111111110—12
Haas	1111111010111110—12	Coykendall	1111111100111111—13
West	1111101111111110—13	Delmas	1110111111101110—12
Merrill	1101111111011111—13	Blankin	1011111010101011—11

De Vaull, Jr., won first prize, $58 and 250 standard cartridges. A. Donaldson and West divided second and third money, $36.50 each. Dunshee, Merrill and Coykendall shoot off at blue rocks for

fourth, fifth and sixth prizes. Fay seventh prize, D [illegible] prize and Walsh ninth prize.

It was growing late in the afternoon and the president decided that the second match would be at 8 birds instead of 15 as advertised. The shoot, or race, as it is now termed, was 30yds. rise, Hurlingham rules, ground traps. The following is the order of the shooting:

Slade	11212000—5	West	11112121—8
Fay	11111211—8	R Wilson	11001110—5
Pixley	10210201—5	Kellogg	22022002—5
W Burnett	01220001—4	Hinman	22011100—5
Merrill	01111223—7	Delmas	21111223—8
Jellett	11012202—6	Coykendall	11012111—7
Haas	11022020—5	A Donaldson	12122122—8
Golcher	11200120—5	Dunshee	12111101—7
J B Burnett	11111202—7	Eyre	11110120—6
F Bassford	11111120—7	Cross	21110220—6
E Donaldson	12121111—8	Walsh	02122212—7

There was quite a number of even scores in this race, and the lucky ones, Fay, West, A. Donaldson, Delmas and E. Donaldson, divided the cash prize, $149, between them, and were to shoot off for fifth prize, a handsome Smith gun. The six contestants that scored 7 birds each will shoot off for the sixth and seventh prizes this afternoon. F. Bassford won eighth and Coykendall ninth.

Oct. 8.—The gathering of sportsmen at San Bruno to-day was very large. A more favorable day could not have been wished for. The heavy cold wind that prevailed through the latter part of yesterday had died away and in its place came a refreshing breeze just stiff enough to make the day a most pleasant one. In the morning the performance opened with a blue rock shoot. The race continued up to noon. The second contest began after noon and owing to the very large entry it did not terminate until about half an hour before sundown. The live bird contest was very spirited. The pigeons provided for the occasion were a remarkably fine lot and darted from the traps with great rapidity. The shooting was acknowledged to be the best ever witnessed on the San Bruno grounds. Rice manipulated the strings and the referee, H. H. Briggs, gave general satisfaction. First score was at 20 blue rock targets, 18yds. rise, 5 screened traps, entries 26:

Dunshee	11111111111111111111—20
Coykendall	11000010111010111110—12

A Schwerin	111 11111100111111111—18
W Burnett	10J1101011111101001—13

E. Dunshee made a clean score and took first; A. Schwerin came second; F. Bassford and E. Donaldson divided third and fourth; Kellogg, H. Bassford and West tied for the fifth, sixth and seventh prizes, and divided them; Delmas, Campbell, H. Golcher and Bruns tied for the eighth prize, and, on shooting off for same, J. Delmas won.

The next and last shoot of the day was at 12 live birds, 30yds. rise, ground traps, Hurlingham rules; entrance $5. The figure 2 shows second barrel:

Coffin	11110111001— 9	Kellogg	10111212212—11

H Golcher	12211200211— 9	W Burnett	01112110201— 9

The above contest was very cleverly won by Mr. Merrill of Stockton. His cash prize was $72. Kellogg, Coykendall, Schwerin and Kerrigan, with clevens to their credit, took second money, $27 each.

Oct. 9.—The third and last day of the State Sportsmen's Tournament ended under most successful auspices. The attendance was quite large. The pigeons were an excellent lot; in fact, they were voted to be the best-flying birds that were ever produced at a trap shoot in San Bruno. In the live bird contest Merrill made a clean score and won the handsome diamond badge of the association. Donaldson and his competitors shot off for the Smith gun. It was won by Donaldson.

First contest, for the diamond badge, association match, at 20 live birds, ground traps, 30yds. rise, Hurlingham rules; prize, a diamond badge, presented by the vice-president. The conditions of this shoot were that the winner must hold the badge for one year, until won three times by any member, when it shall become his personal property, the winner at each meeting to surrender the badge at the succeeding meeting and to receive the entrance money at such last-mentioned meeting. Open to members of the California Sportsmen's Association only, 26 entries:

Sperry	01102001010022011 1—12
Haas	12211210121122211110—18

Dobbins	11001101111000110111—13	10 11 10 11 10—7—20	

The wind-up shoot of the day and the tournament was at live birds. 12 live birds, 30yds. rise, $5 entrance:

Fay	11111100011— 9	Freer	20001111211— 8
Haas	11111110210—10	Dobbins	12211011112—11
Golcher	12012111111—11	Delmas	02211121111—11
Merrill	12111211111—12	Cate	11221121010—10
Fox	11101011111—10	Osgood	02001010111— 7
Coykendall	12110111011—10	Fanning	11111111111—12
Ingalls	20001111211— 9		

Merrill made another clean score, which speaks well for the young Stockton marksman. He did not miss one bird for the entire shoot. The first and second prizes were divided between Merrill and Fanning, both having made clean records. Golcher, Delmas and Dobbins divided third, fourth and fifth money.

This shoot ended the State Sportsmen's Tournament, the most successful meet that has ever been held on the San Bruno Pigeon Grounds.

BUDD VS. BREWER.—Dunellen, N. J., Oct. 12.—Sportsmen from all over the country are gathered together to-day on the grounds of the Middlesex Gun Club to witness the match between C. W. Budd, of Des Moines, Ia., the American champion, and Jack Brewer, of Philadelphia, Pa., the best man the East has produced. The match is at 100 birds from 5 traps, strict Hurlingham rules, for $250 a side. Mr. Budd used an L. C. Smith hammerless, 7lbs. 12oz., with 3¾drs. FFG powder, 1¼oz. No. 7 trap shot, loaded in Climax shells by Chamberlain. Mr. Brewer shot a W. W. Greener, 7lbs. 14oz., using 4½drs. of new American wood powder and 1¼oz. No. 8 chilled shot in his first barrel; in his second he had 4drs. of Dupont's diamond grain and 1¼oz. No. 7 trap shot, loaded in Ely shells. The day was raw and cold, with a strong wind blowing across the traps from left to right. The birds were a good lot, some lingered on the trap, only to start off like shot from a gun. Previous to the match several sweepstakes were shot, the scores appearing below. Promptly at 2:15 Referee Mr. W. Fred Quimby called the men to the score. Brewer led off, killing his bird, Budd following suit. Budd was first to miss, losing his third bird, a towering incomer, that fell dead just back of the dead line, he then started in and made his big run of 32 kills, missing his 36th, a hard straight driver, also his 40th, finishing his first 50 with 37 to his credit. Brewer missed his 4th, a strong right quarterer, his 11th, 20th, 24th and 28th, a towering driver that was hit hard, finishing his 50, two birds behind. A recess of ten minutes was taken and Brewer started in to reduce the Western man's lead; at the 69th bird he tied the score and was loudly applauded; the 78th round he was one bird ahead with the remarkable run of 42 kills. He missed his 78th, a right quarterer, and the score once more stood even. The little Western man now started in and at the 81st round had the lead by a bird, but slipped up on an incomer and the score, amid the greatest excitement, once again was a tie. Brewer lost his 89th and 92d, both right quarterers. Budd killed his last 18 straight and thus ended one of the most interesting matches ever witnessed in this section.

	20212122222— 9—90

Second barrel to kill, 20 times; on the ground, 23 times. Second barrel to kill, 29 times; on the ground, 18 times.

Brewer killed 18 straight drivers, missed 3; 4 right quartering drivers, missed 1; 6 left quartering drivers; 14 hoverers; 17 left quarterers; 21 right quarterers, missed 4; 6 towering drivers, missed 2; 4 incomers.

Budd killed 17 straight drivers, missed 2; 9 right quartering drivers, missed 1; 6 left quartering drivers; 7 hoverers; 12 left quarterers; 30 right quarterers, missed 1; 3 towering drivers, missed 2; 8 incomers, missed 1; incoming towerers, missed 1.

Sweep No. 1, Hurlingham, 5 live birds: Quinlan 5, Budd 5, Peacock 3, Seigler 5, Dickens 5, C. Smith 5, Tec Kay 4. Ties on 5 shot off in next sweep.

Sweep No. 2: Quinlan 4, Budd 5, Peacock 3, Seigler 5, Dickens 4, C. Smith 5, Tee Kay 3. Ties divided.

Sweep No. 3: Quinlan 4, Budd 5, Dickens 5, Seigler 4, C. Smith 5, Peacock 5, Tee Kay 3. Ties divided.

Sweep No. 4: Lindsley 4, Graham 5, Class 4, Budd 3, Seigler 3, C. Smith 5, Mamtz 5, Brewer 5, Peacock 2, Williams 4, J. Day 3, Quinlan 5, Kleinz 4, J. H. Force 4, Creely 5. Ties divided.

Sweep No. 5: Peacock 5, Class 3, Brewer 4, J. H. Force 4, C. Smith 3, Kleinz 5, Lindsley 4, Manitz 5, Hcft 5, Graham 5, Seigler 5, Williams 5, J. Day 4, Quinlan 4, Creely 5. Ties divided.

BROOKLYN, Oct. 12.—Regular shoot of the Coney Island Rod and Gun Club to-day at Woodlawn. Most of the best wing shots of Long Island competed. Besides the competition for the "Donnelly" gold badge, six prizes were shot for. There were five ties for the badge, each man killing seven birds straight. The other prizes, in which there were ties, were divided. Out of the 182 birds shot at only 47 escaped:

H McLaughlin (25)	1111011—6	Capt Mattair (24)	1101110—5
H P Donnelly (24)	1111011—6	G Wilson (21)	0010110—3

Ties for first: A. Schwartz 2, F. Lanzer 1, C. Wise 9, Kerry 10, G. L. Edwards 3.

NEW YORK GERMAN GUN CLUB.—New York, Oct. 15.—A very enjoyable shoot took place on Thursday, Oct. 13 at New Dorp, S. I., when 12 members of the New York German Gun Club stepped up to the traps to compete for the gold medal of the club. The occasion was particularly honored by the presence of Mr. Fountain, president of the Washington Heights Gun Club. After the club shoot at 10 live pigeons, in which Vice-Pres. Schmitt carried off the prize (the second time this year), a number of sweepstakes were arranged and Mr. Fountain scored several victories in a sportsmanlike manner, each successful shot of the honored visitor being vociferously cheered by all present. Inclosed please find score of the club shoot, in total not a very good one, but very fair in consideration of the really extraordinarily strong and wild birds and a stiff wind.

Match at 10 live pigeons, H. and T. ground trap, 21 and 25yds. rise, 80yds. boundary, club rules:

Boessennecker (25)	1101110001—5	Lucas (21)	1110010100—5
Spregade (21)	0111011101—7	Sauter (25)	1010111011—7
Schlicht (25)	1011101101—7	Greitner (21)	1011111011—8
Schmitt (25)	1010111111—8	Bonden (21)	0100001110—4
Hemmer (25)	1100111011—7	Breen (21)	1001011001—5
Muller (21)	1110011010—6	Klein (25)	0110110011—6

NEWARK, N. J., Oct. 15.—The tie match some weeks ago between Gustav Freche and Thomas Rudden, of this city, when both killed 20 birds out of 25, led to another race being shot this afternoon. The match came off on John Erb's grounds on the Bloomfield road, a number of old time shooters being present. The conditions were 50 birds each, 25yds. rise, for $100 a side. Freche bet considerable outside money. The match was very close, and although Rudden led on the first score of ten by two birds, Freche won the contest by one bird. O. Von Lengerke acted as referee, and with satisfaction, although one decision gave rise to some kindly criticism. This was when a bird shot by Freche alighted on the rail fence, and being gathered was scored as a "dead bird," many of the spectators claim it was a "lost bird" from having sat on the boundary. Figure 2 signifies second barrel. The following is the score:

Gustav Freche...0110111102110102111111212111112022122202102—40
Thomas Rudden.1012221011222021002122001112101111210211010122—39

NEWTOWN, N. Y., Oct. 11.—North Side Gun Club of Long Island. Seventh average match of the year for $50 gold badge, best average of one year to win it as property. Match at live pigeons, five King's patent traps, handicap rise, 80yds. boundary, no back, club rules, 7 birds each:

Dr Franz	0111010—4	A Eberhardt	1110111—6
J Kroger	1101100—4	A Duryea	1111011—6
G Sims	0101110—4	W Bohmcke	1001011—4
E Barlow	0111111—6	T Tapken	0111001—4
M C Manning	0111001—4	J. Grau	1111000—4
J Winholz	1111011—6	W Krumbeck	1110100—4

Ties on 6 for first at 3 birds: E. Barlow (28yds.) 3, J. Winholz (28) 2, A. Eberhardt (28) 3, A. Duryea (29) w. Second tie: E. Barlow (30) 2, A. Eberhardt (30) 3. In a sweepstake match, ten entries, miss and out, two moneys, Messrs. Barlow and Kroger divided.—AUGUST H. EBERHARDT, Secretary.

BROOKLYN, Oct. 13.—Regular shoot of the Unknown Gun Club. The birds, supplied by Chris. Duerler, were of the best possible description, and gave the outsiders a chance to kill. J. Rathjen won the club's championship badge for the third time this season. In a subsequent sweepstake Rathjen and Pfohlman killed all their birds and divided first and second money. The quality of the birds is shown by the fact that no less than 66 birds escaped out of 128 shot at.

J Rankin (21)	0000101—2	J Tomford (25)	1000100—2

GREENBURG, Pa., Oct. 11.—The tournament conducted by the Greenburg Gun Club at the fair grounds was a decided success. The following are the scores: The first match was for 40, 20, and 10 per cent. of the entrance fees, at 10 birds: Dick 7, Gessler 2, Shaner 4, Ehalt 1, Overholt 5, Cochran 3, Thomas 2, Donohoe 3, Sexton 4, Chain 4, Brunot 3, Cummings 3, Householder 4. Dick took first money and Overholt second. Chain won the "miss and out" and third money by shooting at four birds and breaking two.

The next free for all match was on same terms at 10 blue rocks, 18yds.: Cochran 6, Overholt 4, Gessler 4, Donohoe 2, Thomas 2, Brunot 6, Dick 7, Shaner 8, Cummings 7, Fretts 6, Ehalt 4, Chain 6, Sexton 7. Shaner won first by breaking 8 out of 10, Dick second, Chain won third by breaking 4 birds.

This finished the advertised matches, and everybody joined in to get up several extra contests. The first was at 5 blue rocks: Overholt 3, Cummings 5, Dick 2, Chain 2, Sexton 2, Cochran 3, Holsinger 2, Fretts 3. The next special match was at three single, and won by Cummings. Another match at ten birds followed: Dick 7, Cochran 3, Cummings 8, Shaaner 5, Ehalt 4, Chain 6. In this Cummings got first and Dick downed second. This finished the shooting, part of which was done in a rain while a high wind prevailed all day, and the sun failed to show itself even at intervals. The match was pronounced a success by the visitors from Johnstown, Scottdale, Larimer and other near towns, and was thoroughly enjoyed by all present. The rather deficient scores were undoubtedly caused by the bad weather and chilly wind.

BROOKLYN, Oct. 11.—Acme Gun Club regular shoot for the gold badge to-day at Durler's Park, Jamaica Plank Road, 20yds.:

C Wiessel	11011101111101011100—14

Ties: C. Wiessel 2, M. Schoettler 0.

SOLOMON CITY, Kas., Oct. 9.—On account of the sultry weather in this section the club has done but little shooting, but at this meeting decided to hold its first hunting tournament at Cheyenne bottoms for ducks, brant and geese. The result you shall hear in the future. Match shot Oct. 8:

J Kraenchi	01101010000010001101— 8
T J Epworthy	00001111111111011001—13
C H Smith	10111101011111111101—16
E E Crooks	01111110110110001111—14

TAUNTON, Mass, Oct 1.—Taunton Fish and Game Protective Association. Eleven members met and shot for the club prizes. Match at 10 clay-pigeons, clay-pigeon trap, 16yds. rise, 3 angles, N. G. A. rules: G. L. Smith 7, J. T. Hall 7, G. L. Davis 9, F. S. Keith 5, A. Handy E 6, Leonard 7, C. Hill 4, W. Barstow 8, J. Davis 8, C. T. Snow 3, E. Bowen 3.

Match at 10 bats, clay-pigeon trap: Smith 8, Hall 8, G. H. Davis 10, Keith 6, Handy 9, Leonard 5, Hill 8, Barstow 10, J. Davis 9, Snow 8, Bowen 8.

Match at 10 blue rocks, 3 blue rock traps: Smith 5, Hall 8, G. H. Davis 7, Keith 5, Handy 7, Leonard 6, Hall 7, Barstow 8, J. Davis 6, Snow 7, Bowen 2.

Match at 10 clay-pigeons: Smith 6, Hall 7, G. H. Davis 8, Keith 5, Handy 5, Leonard 8, Hill 3, Barstow 7, J. Davis 6, Snow 9, Bowen 7.

Match at 10 blue rocks: Smith w, Hall 7, G. H. Davis 6, Keith 4, Hardy 5, Leonard 8, Hill 3, Barstow 7, J. Davis 7, Snow 10, Bowen 9.

Match at 10 blue rocks: Hall 7, G. H. Davis 8, Keith 6, Handy 7, Leonard 7, Hill 3, Barstow 10, J. Davis 3, Snow 7, Bowen 5.

W. Barstow first, 92; G. H. Davis second, 85; C. T. Snow third, Hall and Leonard fourth, 80; J. Davis fifth, 79; Keith and Handy sixth, 74.

BLACKBIRDS FOR THE TRAP.—At a recent Kansas City tournament blackbirds were used. The birds, says the Kansas City *Times*, were supplied by J. C. Caldwell, of Norburn, Mo., who nets them in the marshes in that vicinity. He uses a net 24ft. wide and 90ft. long. He finds one of the flyways of the birds, and sets the net on its route, the two edges touching the ground and the net forming a canopy, open at either end. It is made of No. 18 thread, with inch meshes. A clever contrivance enables Mr. Caldwell to drop the net in a twinkling. Decoys are placed under it, and millet, hemp and sunflowers are used to entice the wild birds on. A flock once under the net, it is dropped, and the birds can't even struggle. Five hundred and twenty birds is the greatest number ever made by Mr. Campbell at one haul. Once captured the birds are stored in a house 30ft. square by 8ft. high, made of wire netting. "They can be kept six months if they are handled right," he says. "They must be fed carefully and kept in as much a state of nature as possible." The birds are not crated loosely together when shipped as are pigeons, but each blackbird has its separate little compartment. Blackbirds are about as different from pigeons in size and flight as could be imagined. There is a gamy twirl of the tail of the blackbird as he comes out of the trap, a challenging flutter of the wings, and a dart and "away all" in a twinkling. He doesn't wait to see where he came from, and apparently cares not whither he goeth. It takes quick shooting and good shooting to kill. Where there was single bang at pigeons on Tuesday, the order yesterday was bang! bang! for both barrels were the rule, not the exception. This made the sport all the more interesting and exciting, especially as the wind blew away from the traps and sent the birds generally in that direction. With blackbirds it is the tailer which is hard to reach effectively. The scores were good ones, but not up to the scores at live pigeons, as was to be expected. The blackbirds were a good lot, fresh and strong. In the very first shoot at the little fellows a surprise developed, as the two big professionals, Stice and Budd, were shot out of first place, and the latter completely out of any money. Mr. Budd laid it to the shells. Mr. Stice is not at all partial to blackbirds, and was satisfied with a division of second money. It was surprising how few of the visiting marksmen had shot at live blackbirds. They are by no means a common target, and such men as Mr. Crabill had never pulled a trigger on one. Their vitality is much greater than that of the pigeon, and when hit they struggle to fly just as long as they can flap their wings. Birds with two or three shots in their body often get out of bounds. Some of the marksmen were pleased with the target, others were not. Few had the proper shot for the birds, and this accounted for the disappointment of several.

PLUNGE TRAPS.—"The use of plunge traps exclusively in the live bird shooting," says the Kansas City *Times*, "was condemned by the professionals present, who at first declared they would enter into no such matches. Others also objected. 'Why, sir,' said Mr. Stice to a reporter, 'I've shot all over this country, from Michigan to Texas, and from the Atlantic to the Pacific, and Missouri is the only State in the country where plunge traps are used with the gun below the elbow. The sportsmen here are fifty years behind the times. I will shoot any man in Missouri, I to use ground and he plunge traps, and he can put his gun to his shoulder before he calls 'pull' if he wants to. Plunge traps are away behind the age.' 'That is the size of it,' put in Mr. Budd, emphatically. 'The great objection to plunge traps,' went on Mr. Stice, 'is that soft birds can be used—birds which wouldn't rise from a ground trap. Just as well put big potatoes in to throw up and hoot them before they come down. A bird has no chance to get on the wing before he is shot at. Now, a ground trap gives a bird his natural flight.' 'I don't think much of the plunge traps, either,' remarked F. S. Crabill. 'They have gone out of use almost everywhere. They give a bird no chance to gather himself before he is killed. He is thrown up and knocked down before he can get his wings well in motion. Now, a proper ground trap, you see, gives a bird his natural flight. It is much more like field shooting and is much better sport.' The Missouri State Sportsmen's Association adopted the plunge trap years ago. At the last State tournament a resolution was introduced to change to ground traps. Enterprising and advanced sportsmen have been agitating the question since, and urging the adoption of the ground trap with such success that it is thought that plunge traps will be a thing of the past after the next meeting of the association."

Hon. H. M. Seely has been passing his summer's vacation in the Adirondacks, devoting his time mainly to fishing. While out with a guide, in a boat on Chateaugay Lake, Franklin county, N. Y., a few days since, indulging in his favorite pastime, he met with a hunting adventure that rarely falls to the lot of a sportsman. They noticed something swimming toward them, but at some distance. Gradually it drew near, when they discovered that it was a buck. Being destitute of firearms they were at somewhat of a loss how to proceed; but as delay might prove to be dangerous to themselves, or give the deer an opportunity to escape, Judge Seely hastily grasped a piece of board lying in the bottom of the boat, and when the animal came within reach gave him a sturdy and stunning blow over the head, killing it. They carried their trophy in triumph to the hotel, and it furnished a most toothsome repast.—*Honesdale Citizen.*

Yachting.

KEEL BOATS AND FALSE PILOTS.

THOUGH the defeat of Thistle was by no means pleasant for yachtsmen on the other side of the water, it might at least have been made highly profitable to them had they chosen to consider it carefully and thoroughly; but the entire effort now seems to be in the direction of false conclusions and baseless statements and excuses. Carried away at once by the fact that Volunteer had a centerboard, some of the British papers have declared outright that their boats must have centerboards also to retake the Cup. Some allowance must be made for non-technical journals which grasp only at the most obvious features and waste no time in going beneath the surface, but it is surprising to read the following in such a journal as the London *Field*: "It appears likely that there will be some clamoring that any future British challenger should make use of our invention of the centerboard. The Americans have now had an almost exclusive monopoly of this British contrivance for more than half a century, and have become to regard it of purely American origin. With this amiable foible we will not quarrel, nor do we think they can quite blame us if we again take up with a long discarded notion. It is quite possible that if Thistle had been fitted with a type metal 'fin' in her lead keel, to drop 4ft., that she would have held Volunteer on a wind in the second race."

The part which the *Field* took only a few months since in the proposed Mayflower-Arrow match, is still fresh in the memory of all, how it then proposed to force an unjust and arbitrary penalty on this "British contrivance" which it now feelingly alludes to as "our invention." Time works wonders, but we hardly expected to see such a great wonder in so very short a time; that such a conservative journal as the *Field* should tenderly take under its care that abominable, mischievous and altogether reprehensible device, the centerboard; a device proscribed by British yacht clubs and not recognized on British courses. Only a short half year since, and the *Field* was foremost in the effort to penalize Mayflower's centerboard to an extent that would have crippled her materially, and now we find it seriously speculating over what might have been, had Thistle only been provided with a centerboard.

No one can blame British yachtsmen if they decide to adopt the centerboard permanently after being convinced of its merits, but the present position in which some of their representatives have placed them is by no means a creditable one to their fairness and good sense. On the one hand the centerboard is condemned and prohibited, no test of its merits or defects is possible in British waters; British yachtsmen know nothing of it and do not want to learn. On the other hand, now that Volunteer with a centerboard has beaten Thistle with a keel, the newspapers, from the *Field* down are ready to pave the way for the national adoption of this "British contrivance," and a termination of the American "monopoly" of the board. Had a fair and liberal stand been taken years ago by the Y. R. A., admitting centerboard boats to its races, the centerboard would have been tested beside the best keel boats, the shortcomings of the latter might have been remedied long since, the defeats of the last three years might have been avoided and the weak-kneed cowards of the keel who are now ready to throw it over for the board might have been spared much screw and mortification. The system of protection which has been pursued by British yachtsmen has fostered a delusion which only succumbed in the late outside race, that any of the large keel cutters can hold to windward with such a powerful combination of keel, lead and board as Volunteer. Genesta, Galatea, Thistle, have all tried it and failed, and it is beyond question that neither Irex nor Marjorie would be much, if any, better.

Why they have failed, and what the remedy may be, are questions which involve the existence of the present keel racing fleet, questions of the first importance to yachting, but those to whom yachtsmen might look in this emergency have entirely failed. For the "why" they are told that the lessened immersed surface and skin friction of Volunteer made her faster, and that the board held her to windward; for the "what" they are advised to "copy a leaf from their rival's book," to put centerboards in their keel yachts. The excuses and explanations quoted below are amusing, and to a certain degree interesting, as showing public opinion among British yachtsmen, but there is one prime error which is of far more importance. As long as the large cutters sailed alone, or even sailed against the old sloops in this country, they were considered invincible to windward, but unfortunately for them, the rule against centerboards made any preliminary trials with the latter impossible until the grand contest came in 1885. Lacking any direct comparison, it was only natural that the powers of the cutter to windward should be rated very high, and that the serious defect which has resulted in three defeats should have been unsuspected until too late.

The weak point of Genesta, of Galatea and later of Thistle, has been the deficiency of the lateral plane, either in form, area, or both, and the consequent failure of the yachts to hold on. The responsibility for this defect must rest largely with the theorists and scientists, headed by the *Field*, who pose as guides for the designer and naval architect whose opportunities for personal research and elaborate investigation are hampered by the demands of business. For the dozen years that centerboards and keels have came into direct rivalry these authorities have held up one point as paramount to all others, the immersed area and skin friction. Year after year the deep keel boat in American waters has beaten the shoal centerboard of far less immersed surface when running free, but in spite of such practical demonstration the doctrine based on tank experiments and pure theory has remained unaltered abroad. Madge beat Schemer, Genesta outran Puritan, Galatea held Mayflower better when free than to windward, Thistle is beaten 15m. to windward and beats Volunteer 3m. in running, but the grand old theory remains unshaken, and compels a certain admiration for the colossal obstinacy and and blindness of its adherents.

This spring the *Field* said: "Mayflower will still have some advantage by the reduction her immersed surface can be made to undergo when her board is lifted some three or four feet. The main advantage of a centerboard is that it can be housed when sailing on a broad reach, or down wind." * * * "So far as sailing by the wind is concerned, the board does not appear to hold the yacht to more advantage than a fixed keel does a modern yacht of deep cross section." * * * "Where the centerboard has the advantage is in lifting the board for sailing off the wind. By housing the board in a yacht like the Mayflower, a reduction of 10 per cent. is at once made in the area of the immersed surface, and the effect of this is always manifest, especially in light winds or low speeds."

Since this was written the races of the season have added fur ther proof of its error, but now, after Thistle has beaten Volunteer under the conditions when according to theory Volunteer should have beaten her the worst, the same false beacon light shines out clear and bright. "This superiority in sail, spread and diminution of wetted surface, due to the shifting centerboard, were quite sufficient to bring about success with any decently designed vessel." * * * "The latter (Volunteer) although drawing less water than Thistle, is owing to her extra 3ft. breadth, the stiffer, and carries probably 5 per cent. more canvas. This fact, taken in conjunction with the small wetted surface of Volunteer, and the efficiency of the centerboard in holding a boat to windward, will account for Thistle's defeat."

The same "amiable foible" of skin resistance is made to shoulder most of the blame, though now a part of the beating is laid to the power of the board to windward. Volunteer is taken as the standard, her reduced surface, and her shifting centerboard won the race, the possible defects of Thistle are of little account, and the way is paved for a further perpetuation of the old errors and for further defeats of the keel. The main point, the whole gist of the matter is left untouched, though it appears in one single sentence in the *Field*'s comments, as follows: "The necessity of having the vertical longitudinal section so pared away at the ends to reduce the wetted surface for light weather sailing, would obviously reduce the resistance to leeway."

That such a cutting away was a necessity is the doctrine that the *Field* has always preached, with what results is seen in all the late Cup races. The importance of a reduced surface has been exalted above all other considerations, and the question of obtaining adequate lateral resistance has been left unnoticed. It is this question that alone concerns the designers of keel boats to-day. All the experience in this country goes to prove that the importance of skin friction and reduced area has been vastly overrated, and that instead of being the first and great consideration, it may be left in a great measure to take care of itself.

What designers now want to know is the required area of lateral plane, the best disposition of this area to secure the maximum lateral resistance, and the effect on lateral resistance of the various plane and curved surfaces and angles which make up the side of a yacht. Such data is as yet unobtainable; if science and theory can give it to the designers, so much the better; if not, science had better take a back seat. Theory dictates curved surfaces everywhere—at joining of keel and garboard, at bottom of keel—but where this is done the waste of holding-on power is so immense that it must be compensated by excessive draft. Race after race has proved this, and offers a sufficient justification for a refusal to accept the theory as complete and of practical application in its present form.

We do not wish to deny the great value and importance of the experiments made of late years; they have thrown light on many dark subjects, widened the sphere of research, and placed new tools in the hands of the naval architect; but that there is great danger of their results being overestimated or misinterpreted is shown in the present instance. The tank experiments of the late Mr. Froude on the subject of skin resistance are in themselves of the greatest value, but we cannot forget that in the Cup races the yachts are not towed in a tank, but sailed in broad waters, and if the facts in these races contradict the theories, so much the worse for the latter.

The result of the Volunteer-Thistle race is to put the keel boat in a position of defense, it rests with it how to prove its quality with the board. What help is it getting from its old adherents and friends? No investigation as to its weak points and possible improvement is made, only the bald conclusion, the centerboard and reduced surface did it; hence, build centerboard boats. The excuses in the British papers are simply laughable to those who know both boats and have seen them sail. *Land and Water* lays the defeat to the board, and at the same time echoes the cry about square courses. "Although the defender of the Cup was not so fast through the water as the challenger, she ate to windward, probably by the aid of the mechanical contrivance under water, in such a wonderful way that after reaching for five minutes she could have easily headed the Scotch cutter." * * * "As the winner scuttled away to the 'Hub of Creation' soon after her victory, the respective merits of the two boats on a broad reach or with the wind on the quarter remains untested." * * * "General Paine would not consent to sail his vessel against the Thistle over a triangular course." * * * "On the third point of sailing the Americans interested in the Thistle have not given an opportunity of testing the two types of vessels."

As these statements will possibly be accepted by British readers, it is but fair to correct them. Thistle was beaten so thoroughly to windward as to satisfy all her American friends that Volunteer was the better boat by the standard set up long since by British yachtsmen, that a yacht's power to windward was the measure of her good qualities, and that even a haystack would go to leeward. Even if reaching powers were in question, and they were not, and never have been where cutters and sloops raced in America, Thistle was so easily held by Volunteer when off the wind that she could not have won on even a square course. As to Gen. Paine shirking a triangular race, and Volunteer "scuttling off," the facts are that no definite proposal for such a race was made, and all who saw the second race, even though friends of Thistle, had all they wanted.

A correspondent of the *Field*, a "Dundee yachtsman," after lamenting that Thistle is both too wide and too deep, continues, "There is no doubt whatever that any other shape of course than a square one is not a fair test for a seagoing yacht." His further complaint against the New York course is just enough, but he has surely forgotten that two out of three races were set for the open sea, and also that when some years since Vanduara beat Samoena solely in windward work, though slower at reaching, all Scotland stood firmly committed to a windward course as a proper test.

Another correspondent, an "Ex-commodore," drops a sigh over the "hollowness" of Thistle's defeat, and then continues, "If it is to be always a contest between a skimming dish with a centerboard and a deep-keeled vessel, it seems to me we had better cave in for good and all. It is not within the compass of human skill to deviso a heavy ballast-carrying vessel which shall under ordinary circumstances defeat one of light draft but of sufficient stability to carry an equal or greater amount of canvas in proportion to tonnage. The Americans can, of course, impose what conditions they like. They are cute enough to know that, no matter what the size and power of the English yacht may be, they can build a skimmer to beat her. We admit the unfairness of the competition by not allowing it. Why are we fools enough to engage in it? Nearly every yacht race is won by superiority in getting to windward, and in this the centerboard is and will be matchless."

How it would astonish this worthy "ex-commodore" to stand beside Volunteer on the dry dock and see this "skimming dish" in her true proportions, a yacht of greater draft, depth and displacement than many a famous cutter of not so long ago, a boat little inferior to Thistle in size or displacement, and to the eye a more powerful craft. When it is considered how well informed generally in regard to the British fleet all American yachtsmen are, it is wonderful what ignorance prevails in England in regard to the leading American yachts. The doings, dimensions and possibilities of Irex, Genesta, Marjorie, Clara, Tara and the rest, have been familiar to American yachtsmen for years, while abroad such a boat as Volunteer is gravely held up as a mate to Fanny, Gracie and the American sloops.

Another correspondent of the *Field*, Mr. W. D. Gainsford, after finding comfort in the thought that some of the Cup races would have been won under the old Y. R. A. rule, continues: "Now, a fixed keel holds no brief against the centerboard. Then why do we not have centerboards? Because they would not be of any use outside the Solent. Americans do not cruise. Their boats, however big, are practically what we call day boats, and a centerboard is good enough for that purpose. Our yachts are ships, and naturally and properly our racing yachts are ships too. They are not the fastest craft in the world, but they are the fastest ships. If not, why do not the Americans send over a centerboard to sail here? Simply because they are a good deal cuter than we are. They know too well that no boat that could get across would stand much chance of winning in our waters."

Mr. Gainsford is partly right, no centerboard would stand any chance of winning in British waters as long as any way of crippling her in the interests of the keel could be devised, as in the case of Mayflower this spring. British yachtsmen have reaped a full reward for their prohibition of the centerboard; had a centerboard boat crossed a year or two since, the defects of the keel would have been discovered sooner, and might have been remedied in Thistle; had Arrow's owner made such fair conditions that Mayflower and Mr. Burgess would have crossed and spent the summer abroad, the forces would have weakened to an extent that would have made a victory for Thistle easily within the limits of possibility. That Volunteer cannot cross the Atlantic in perfect safety, or cannot hold her own in British waters anywhere outside the Solent, is a fiction that can harm no one but British yachtsmen.

Still another writer finds the cause of the defeat in the fact "that Volunteer sailed more or less on her keel and Thistle sailed more or less on her side, "his conclusions being favorable to the former. It has been a noticeable fact for three years that the wide American boats have sailed at as great an angle very frequently as Genesta and Galatea, at times even exceeding them in heeling; while this year Thistle undeniably stood straighter than Volunteer, so the bottom drops out of this idea.

In nearly all the comments that have appeared abroad there are the same condemnations of American boats, American courses, and American methods, the demand for reaching rather than windward courses, the admission that the centerboard did it all. In none is there any serious attempt at a fair comparison of the two boats, any suggestion that Thistle's shortcomings rather than Volunteer's excellence contributed to the result, or any earnest effort to improve the keel boat; in fact, the friends of the keel abroad are making but a sorry showing.

That the case is not as bad as they make it, that the time has not come to follow their weak-kneed counsels and build centerboard yachts or give up racing, is plain enough to those who have seen the course of events in America since Genesta came here. There is much that points to a great future for keel boats, even in this country where they must be in constant competition with centerboards, but the work will be no child's play; to build a perfect keel boat is no easy task, but there is no reason as yet to consider it an impossibility. The ability to alter the lateral plane within wide limits by raising or lowering the board, or even by permanently altering its size or shape after trial allows the designer of the centerboard boat to correct errors of trim or sailplan to an extent not possible with the fixed keel, and makes the work of beating a really good centerboard boat like Volunteer with a keel boat a difficult matter, but there is no reason as yet to believe that it cannot be done.

The first step toward such an improvement in Thistle seems to be to discard, as fully as the leading American designers have done, the theory of skin friction, and to devote all the labor to improving the efficiency of the lateral plane. How this is best done, what area is necessary, how it should be distributed fore and aft, and in what form its bounding surfaces should be, the designer may properly look to the scientist and investigator to show; but until both have gone further into the problem than has yet been done, it is too soon to condemn the keel and to formally adopt the centerboard for all racing craft.

THE DEPARTURE OF THISTLE.—On Oct. 14, at 7 A. M., the anchor was quietly weighed and Thistle sailed out of the Narrows on her return trip to Glasgow. But few were on hand to see her off, only the yachts Vision and Hinda firing salutes as she left. She is under the same rig with which she crossed—short topmast, bowsprit and boom—and has the same crew, Captain Barr sailing her, with Captain Kerr as navigator.

THE DINNER TO PAINE AND BURGESS.

THE dinner given by the New York Y. C., in honor of Messrs. Paine and Burgess, on Oct. 13, was attended by a large number of yachtsmen, mostly members of the club. Delmonico's large ball room was gaily decorated with yachting colors, while the tables were covered with prize cups. In the center of the main table, opposite the Commodore's chair, was the America's Cup. Lander's orchestra and a vocal quartette furnished music during the evening. Gen. Paine and Mr. Burgess were seated on the right and left hand of Com. Gerry. After a short speech from the Commodore the Song of the Cup was sung, and then, in answer to the Commodore's toast, "Charles J. Paine—our thrice victorious champion; our antagonists always follow his memorable order, 'Keep astern;'" General Paine responded as follows:

I beg to thank you as heartily as I am able for the honor that you do me here to-night. I wish I could thank you as deeply as I feel for the cordiality and heartiness of this reception. But I must beg that you will believe that my feelings are deeper than I can express, and take for granted what I wish I could say to you.

I think, gentlemen, that we ought all of us to recognize the great debt that we owe to challengers that come here for this Cup. They not only encourage yacht building and thereby give us more yachts, but they develop a most amazing enthusiasm for yachting all through the country. And when they have gone away they have left a very comfortable feeling of satisfied patriotism. I only hope that our next friend who comes on the same errand will leave us with the same feeling.

I have been asked a good many questions since the late races about the speed of the Thistle—the amount by which she was beaten seemed not at all compatible with her record on the other side, and when she goes back she will be used in all probability to measure the speed of any new yacht that comes over for the Cup. I think it will be very important to have as near as can be a correct judgment as to her speed here, and I wish to put on record my very strong opinion that we have never truly measured the Thistle in this country; that the speed that she is really capable of has not been ascertained here. In my opinion she is a great deal faster than many people here credit her with being. I wish, gentlemen, before I sit down, to thank the members of this club for all the courtesies that I have received from them, and to record my obligations to the owner of the Oneida for the assistance received from him during the races.

Mr. Burgess spoke briefly in response to the following toast; "Edward Burgess—our model American yachtsman, who designs only to surpass himself."

Other toasts and speeches followed, and the old song of the America—

"Where did she come from?
New York town.
Who's her skipper?
Old Dick Brown,"

was sung by Mr. Frank Robinson, followed by other songs, after which the meeting broke up.

JO, AN OLD TIME CRUISE.

"MORNIN', boss. Wat's name told me to tell you that him and wat's callem and the other feller'd be 'board de Mercy as soon as they git fit with life'severs. Guess Jo hain't got no call fo' dem t'ings zackly, fur de curds say I be choked with a rope, spec it be froat halids," and diving into the forepeak Jo was lost among the sea stores.

The trio having arrived, the Hercules got under way. Our crew, Budd (broker), avoirdupois 97lbs., wiry, quick as a cat and perfectly fearless; Lyons (college), splendidly formed, up in the classics, and one of the very best of very good fellows; Chrystell (theatrical), witty, gay and full of music and dance; Jo (cook), active, amiable and obedient; the writer (drygoods), and the least said about him the better.

We had a continuous fair wind (where the Hercules loves to romp and enjoy herself) up to the evening of the fourth day, and were abreast of a little creek at sundown, when the wind hauled in S.E. and got up a bubble. We put the "old gal" at it without avail, and were obliged to run back to Mahone's for a harbor.

We had made about sixty miles in the four days and were happy. While waiting for another fair wind I will introduce you to our ship. She is not beautiful but powerful, as stubborn as Bob Fitch's mule, and twice as independent. She goes rooting about in lumpy water like an "old sow in a tater patch" (I borrow from Jo), then turns tail and sails off down wind like a school girl with ribbons flying. She came near drowning us once in her tantrums and we gave her away to an oysterman at Squan, on the Jersey coast, but she came back in a week all the same, "by herself." A river pirate stole her but she was home next day, head up and pert as a blooded pup.

The storm lasted two days, and cleared up with the wind N. W., and from over Hawk's Nest and swamped, bailed out and proceeded. "Laws a-mighty, boss, how cum dem crazy birds to build a nest way off yar in de bottom of de hocean," said Jo, rather bewildered. Sailed two days and nights with a quartering wind and smooth water. Sighted the sand hills at Cape Henlopen morning of the third day, and ran into Lewes 5 P. M.

I want to put our ship on record. The run from Camden to Lewes, 100 miles, was made in ten days gross and seven net. Hired a little bull team and went over to the lighthouse on the cape. Chrystell went through some dangerous gymnastics on the iron rod running at right angles with the top of the tower, used as pilot signals, and was reprimanded severely by Lyons for his foolhardiness. As we approached the ship on our return saw something strange at the masthead. Explains, "Caught dat young mole in de grub locker, filteren, so I gist sent 'im up dar on froat halirds to sweat the grease out on 'im. All de folks in town's bin yer. I told his mudder I was gwine to make soup or hash out on 'im, and you ort to see de old gal git cross that bridge." Jo got double rations for his faithful performance of duty.

Went over to Rehobeth and had good beach bird shooting; walked a mile inland and saw the place where the mythical brig was stranded years ago and recently exhumed. While we were knocking about the cape Jo had been attending to a little business outside of the general routine, and had become such a favorite with the ladies and a terror to their lovers that we deemed it prudent to leave. Started with a fair wind for Cape May. When nearing land the wind flew around to the eastward, and the ship became nervous under crowded sheets and seemed determined to take the back track for the Breakwater. But we kept the cotton on her, with the boom off a trifle to humor her; and after a deal of coaxing and driving ran into Fishing Creek, around the cape.

"Poor old Hercy, she groaned and slobbered worse ner dat old tonger you gin der terbackey over dar among the crows." And Jo, grinning, pointed across the bay. Clear weather and fair wind once more; doubled the cape and ran into Cold Spring Inlet. Took in the town and started for Atlantic City, running the inside passage, with Jo as pilot, who claimed to know every inch of the way. But he hasn't been quite right since we left Lewes and is clean daft now.

"You see, boss, dat water takes yer to de Cow Sheds, and dis is Frog Gut dat runs roun' and roun', and dis yer goes n'war' 'ticular, and dis de fort han' jines the fas' land, den—lem me see—by gosh! now I strike 'im shu'." And so we spent a week in the mud feeding mosquitoes and getting nowhere. Lyons and Christell were nearly dead, and even Jo, who boasted he had lived a month in a muskrat hole, was getting thin and cross-eyed. At last we fell in with a native in a small scow, who for a consideration, mixed probably with a little compassion, took us back to Cold Spring. Here the sick ones left for home, and it was many days before they entirely recovered.

"Never node a poor little 'skeeter to get away wid a lion befo'; dey sucked all de big talk out of 'im, 'cept when he used 'fanity words about de uncertainty of 'uman 'vents and de 'skete: dem be blooded, boss; gosh almitey, how dey made Mars Chrystell dance; arter dey feasted on him dey roosted on Mars Budd's nose (Roman at large) and sing him ter sleep. I like um; used to raise um in a hothouse to fight hornets wid ——" a green head struck Jo on the lower lip and ended the palaver. His mouth is also cross-eyed now.

Rove off cloth lines in place of stranded halliards, scraped mud off the bottom and got the ship in shape for a run home at the first suspicion of a fair wind. "Reservoir Boss," jist leave Jo in de mash where he was born." The poor fellow, sick as he was, could not refrain from getting off a joke as a "masher," remembering perhaps the reason we left Lewes so suddenly.

Many incidents occurred to break the monotony of a long and tedious trip up the bay. Two of our comrades had left us, our ship every day was getting more obstreperous, while Jo, our best man, became helplessly sick, leaving "uhbs," of man and a left-handed boss to run the ship and nurse the cook. Arrived home safe after five weeks' absence. We were all in our teens, and as will be seen novices. All are dead now save the writer, even Hercules (a late stayer) succumbed to the inevitable, stubborn and strong-headed to the last. Poor Jo; he was a noble-hearted fellow, true as steel, and in all our many cruises together he was always the same honest, obliging, good-natured Jo.

R. G. WILKINS.

COOPER'S POINT, Camden, N. J.

WHICH WILL YOU HAVE?

Editor Forest and Stream:

It would seem of but trifling weight, in view of recent events, whether Volunteer and Thistle are called cutters or sloops. Their rig is practically identical, each type having borrowed something from the other, until, so far as their rig goes, it appears that perfection is nearly reached.

The vital question is why does Volunteer show such a very decided superiority in windward work and staunchness over Thistle?

Regarded from a purely artistic point of view, Thistle is perhaps the most beautiful and fairest piece of naval designing ever seen in our waters, and the man who could produce such a work deserves something other than bitter disappointment. Yet, she has been very badly beaten, and not only this, but everything indicates that in heavy weather her defeat would have been far more thorough, for on last Friday it must have been evident to even the most prejudiced adherent to heavy displacement that Thistle was sailing in the weather that best suited her, while Volunteer just rollicked along, making mere play of what to Thistle was a tough struggle for that which was way beyond her power of reaching.

Here we have two boats of same length and rig. For the purpose of argument we will call one a cutter, the other a sloop.

The first has lines as beautiful as the eye or brain can imagine. She draws about 14ft. of water, and her ballast is, say, 13ft. below her waterline. Her beam is 20ft., and the admirers of her type have, fortunately, in advance indorsed her as a perfect sample of what a cutter ought to be, when the designer is untrammeled by any restrictions whatever.

On the other hand is a sloop, 3ft. wider, of 4ft. less draft, and with her ballast 4ft. nearer the level of her waterline. But the radical difference between the two is, that the sloop has a centerboard and immense buoyancy, lifting power, in a bilge close to the water's surface. And, my deluded cutter friends, it was simply exhilarating to see the way in which that high bilge and that big centerboard were lifting her out to windward on every surge, while the cutter was hopelessly sagging a-lee, and not going through the water so fast as the sloop either.

I hear that the thorough little yachtswoman, Mrs. Bell, honestly admitted that "the centerboard did it."

Gentlemen, will you be as candid as this lady?

Thistle has done all that is in her to do. Volunteer has not. Give the latter her large mainsail, and in the weather of last Friday she will beat Thistle three-quarters of an hour over the same course. THOMAS CLAPHAM.

ROSLYN, L. I., Oct. 2.

[Volunteer did carry her largest mainsail, but the old boom, in both races. Our correspondent is probably in error as to the difference in draft of the two, the figures being approximately 13 and 10½ft., instead of 14 and 10.]

FRAME IT BROADLY.

Editor Forest and Stream:

Allow me to indorse the sentiments expressed in your last issue relative to the proposed revision of the deed of gift. The writer is one of the many who have been hoping that the N. Y. Y. C. would take some action in the adoption of amendments such as you suggest. I trust the near future will see them in force and that the new rules will be broadly framed with a view to the best interests of yachting.

An open course for a seagoing vessel should be one of the conditions. The experience of the past three years is almost a guarantee that one of the changes made will be in this particular, and for such let us be thankful. An annual parade may be a good thing in its way, but the occasion of an important match should place it in the background.

The third count you offer might be amended to state that the sailing rules under which the Cup is now sailed for shall at all times govern contests for it. They are fair enough for any one and should another club win the Cup why not hold it subject to the same sailing rules as those under which it was won. Should time and experience make it advisable for the N. Y. Y. C. to alter these rules while the Cup was in custody of another club, allow a proviso that the revised rules may be accepted subject to the consent of the club holding it.

The fourth count I cannot accept as it now reads. In making the waterline length an essential an injustice may be done a challenger. No one will deny that had Volunteer not turned out as good as she was when first tried, alterations in her sail and trim would have been made without regard to measurements, and every expedient would have been resorted to in order to improve her. To compel a challenger to sail on a fixed waterline is to debar him from this privilege, and his vessel might not appear at her best. The idea you offered two weeks ago is a vast improvement, namely that classification is a better guarantee of fair play. Let the deed of gift name various classes and rigs, as 1st, 2d, 3d, etc., of given waterline lengths, within which the possessor of the Cup may be contested, the challenger to elect in which class he will race, the challenged guaranteeing to meet him with a vessel of the same class, and I think the difficulty would be done away with. Each party could experiment at will within the class limits, no hindrance to any chances of victory would intervene, equal privileges would be given to both, a fair field afforded and no favor asked. SPERA.

THE SIZE OF CUP CHALLENGERS.

Editor Forest and Stream:

In a late issue, speaking of the beating of centerboards, you say, "Given unlimited draft and the thing can be done." Soon after the races Mr. Burgess was reported as saying that he did not see how keel boats, unless given greater draft than they had been given so far, could compete with centerboards to windward, or words to that effect. If enough draft cannot be had in the first class, why risk another defeat there, but why not try the second or third classes, where enough draft can be had? The FOREST AND STREAM has given many reasons for having the Cup races in the second class, which seem to apply with more force to the third. In this class a boat of the Pappoose type might be built, with plenty of beam, draft, ballast and sail on a moderate weight. What such craft can do has been shown by the wonderful beatings which the Pappoose, sailed by an amateur, has given the fastest centerboards in Eastern waters, sailed by an expert. A boat of this type, of about 50ft. waterline, would probably be just over 30 Y. R. A. tons and might draw 11ft.

Cannot the challenger build to any class they wish over 30 tons and would not the defender probably be of the same waterline as the challenger? STERNPOST.

BOSTON, Oct. 11.

[It has never been decided that a challenging yacht will be matched only by a defender of her own length, and it is at least possible that if a second class yacht were sent out she would be met with Volunteer, in spite of her size. The third class yacht proposed above would be too small, the limit being 30 tons, Custom House measurement, not Y. R. A. It is probable that in view of the success of the Puritan, Mayflower and Volunteer in the large class, the holders of the Cup will prefer to retain the competition in this class, and that a challenger building a smaller yacht will have to take the risk of being matched against a large one.]

SPEEDWELL.—Mr. Henry Bryant has selected this name for his new schooner yacht, now building by Smith at South Boston, from the owner's designs. It will be remembered that the Speedwell was the first vessel from England after the Mayflower. The new yacht will be 107ft. over all, 90ft. l.w.l., 23ft. 6in. beam, 13ft. draft. The freeboard at bow will be 9ft. 6in., and least freeboard 3ft. 11in. The ballast will be 55 tons, of which 35 will be on her keel. The mainmast will be 63ft. deck to hounds, topmast 31ft. above cap, mastheads 9ft., main boom 65ft., gaff 37ft., bowsprit, outboard, 36ft. The frames will be of oak, double spaced 22in., and the planking of 3in. yellow pine, with garboards and two strakes above of oak. The yacht is intended solely for cruising.

DEATH OF LADY BRASSEY.—This lady, the wife of Sir Thomas Brassey, so well known to yachtsmen through her interesting books, the "Cruise of the Sunbeam," "Sunshine and Storm in the East," and other yachting cruises, died on board the Sunbeam on Sept. 14, and was buried at sea. The yacht was then on a voyage from Australia to England. Lady Brassey was a most enthusiastic sailor and had visited nearly all parts of the world in the Sunbeam.

THE "BURGESS" FISHERMAN.—This new craft, which will be set afloat in a few weeks, will differ in many respects from the old fishing schooners. She will have steel wire shrouds in place of iron, a single round stick for a bowsprit, with one jib, spreaders to the bowsprit shrouds, quarterlifts on the main boom, and a double mainsheet. The keel is also double the depth of the old boats.

CHALLENGES FOR THE CUP.—In addition to Mr. Sweet's notice of a challenge it is reported that Mr. John Jameson, of Dublin, owner of Irex and formerly of Samoena, has sent to the New York Y. C. a notice of a challenge. Nothing further is reported in relation to a challenge from Nova Scotia.

THE LEWIS TENT VENTILATOR.

THE "LITERARY WORLD" says of Kunhardt's "Steam Yachts": "Now that the yacht races are over and the yachting season is drawing to a close, the practical yachtsman, whether he owns a sailing vessel or belongs to the already large and rapidly growing class of steam yachtsmen, is beginning to make his plans for next season. The latter class particularly will be interested in this new book just published by the Forest and Stream Publishing Company. It is, to the best of our knowledge, the only practical work on steam yachts that will be comprehended by the beginner, and at the same time hold the attention and teach something new to the oldest veteran in the art of constructing and managing a marine engine, and of building a hull for it to propel."

TUCKUPS.—In answer to the inquiries as to these boats a correspondent sends the address of James Wignall, opposite Cramp's dry dock, Philadelphia, as a reliable builder. In sailing free the peak is dropped 2 or 3in., and one man is stationed to tend topping lift, which is double. He sets up as the boat rolls so as to keep the boom out of the water, at the same time being careful not to raise the boom too high or it is apt to lift and allow the sail to wrap around the mast, making what tuckup sailors term a "gafftopsail."

JULIA.—This steel schooner building for Mr. C. W. Chapin, will be launched at Harlan & Hollingsworth's yard, Wilmington, at 5 P. M. on Saturday. About 45 tons of her lead has been cast in the trough keel while on the stocks.

A NEW STEAM YACHT.—Mr. Henry Piepgrass has lately completed a design for a large seagoing steam yacht for Messrs. Woodward and Stillman, who will sell their present yacht, Wanda.

GRAYLING.—The new railway at Lawley's will be completed shortly and Grayling will be the first vessel hauled on it. Her tanks and ballast have been removed and she now lies at Lawley's.

SHAMROCK.—Mr. Maxwell's yacht was out on Mumm's ways last week for more lead, 5 tons, on keel, increasing her draft about 6in.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

J. J. B., Saratoga, Cal.—See our advertising columns.

F. L. R.—Do not use shot in the rifle. The Lyman sight is the best.

C. D., Freeland, Pa.—There are hotels at Milford, and you can find guides there.

B. F. M.—Use a cast net or dip net. Write to any one of the fishing tackle dealers, and they will furnish what you need.

M. O., Carrollton, O.—Go to some of the stations on the Detroit, Mackinac & Marquette Railroad, in vicinity of Munising or Ishpenning.

P. D.—How much does a bullet rise, with the usual charge of powder and lead, at Creedmoor at a 1,000yds. distance? Ans. About 35ft.

O. H.—There is a wide diversity of tastes, as shown by extended discussions in our gun columns. Something about .40cal. will give satisfaction; and you may decide for yourself whether to have a repeater or a single shot arm.

G. W. R., Yale University.—1. Stalking and still-hunting are synonymous. 2. The English and the European partridge and the American quail are distinct. 3. Elk and wapiti are different names applied to the same animal, *Cervus canadensis*.

F. W. G., New York.—Will you kindly give me the names of some of our swiftest swimming fish, such as trout, black bass, etc.? Ans. We know of no data to base any estimate of the speed of fishes on. The lobster can move about as rapidly as anything in the water.

C. R. V., Penn Yan.—The dimensions of the Creedmoor (National Rifle Association) targets: First Class, up to and including 300yds.—Bullseye, circular, 8in. diam.; center, circular, 26in.; inner, circular, 46in.; outer, remainder of target. 2. Second Class, to be used at all distances over 300 to and including 600yds.; target 6×6ft.—Bullseye. circular, 22in. diam.; center, circular, 38in.; inner, circular, 54in.; outer, remainder of target. 3. First Class, to be used at all distances over 600yds.; target 6×12ft.—Bullseye, circular, 36in. diam.; center, circular, 54in.; inner, square, 6×6ft.; outer, remainder of target. The count and circles of the Massachusetts decimal and the standard targets are:

Count	Mass. Decimal. diam. of circles.	Standard.
10	3 in.	3.36in.
9	5¾in.	5.54in.
8	8 in.	8.00in.
7	10¼in.	11.00in.
6	12¾in.	14.80in.
5	16¼in.	18.68in.
4	20½in.	26.00in.
3	26 in.	34.22in.
2	33 in.	41.96in.
1	41¾in.	4×6ft. area.

We cannot supply the specimen copy.

Canoeing.

Address all communications to the Forest and Stream Pub. Co.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signal, etc., of their clubs, and also notices in advance of meetings and races, and report of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

NOVEMBER.

6. Oakland, Edwards Cup.

DECEMBER.

4. Oakland, Edwards Cup.

AMERICAN CANOE ASSOCIATION.

OFFICERS, 1886-87.

Commodore: R. J. WILKIN, Brooklyn, N. Y.
Secretary-Treasurer: WM. M. CARTER, Trenton, N. J.

OFFICERS-ELECT 1887-88.

Commodore: R. W. GIBSON..... } Albany, N. Y.
Secretary-Treasurer: F. L. MIX. }

Vice-Com.	*Rear-Com.*	*Purser.*
Central Div..Henry Stanton...	R. W. Bailey.....	E.W. Brown, 146 B'way, N.Y.
Eastern Div..L. Q. Jones.....	Geo. M. Barney....	W. B. Davidson, Hartford.
N'thern Div..A. D. T. McGachen.	W. G. McKendrick.	S. Britton, Lindsay, Can.

Applications for membership must be made to division pursers, accompanied by the recommendation of an active member and the sum of $2.00 for entrance fee and dues for current year ($1.00). Every member attending the general A. C. A. camp shall pay $1.00 for camp expenses. Application sent to the Secy-Treas. will be forwarded by him to the proper Division.

Persons residing in the Central Division wishing to become members of the A. C. A., will be furnished with printed forms of application by addressing the Purser.

THE LEWIS TENT VENTILATOR.

THIS new device, invented by Patrick Lewis, of Quebec, Canada, has been brought to our notice by J. U. Gregory, Esq., of that city, well known to our readers as a sportsman; and he sends us the accompanying printed description of the new device, as seen by a reporter at the Provincial Exhibition: "Those who from necessity or pleasure have used tents have had a realizing sense of the trouble, discomfort and often worse which this inexpensive invention is designed to obviate. There is nothing more disagreeable and frequently more dangerous to the health in tent life than for the inmates to have to turn out in stormy weather or in the dead of a cold rainy night to slacken the halliards of their canvas abode. This job, as every camper-out knows, is anything but a pleasant one; but it cannot be shirked. At least such has hitherto been the general experience. All the tightening, slacking or readjusting have had to be done from the outside and, as already said, only too often under conditions as to weather which make the duty a pain, if not a danger. By means of Mr. Lewis's simple contrivance, however, all this may be done away with in the future without moving out of the tent, without touching a single rope, the inmates can at any moment tighten or slacken the canvas from the interior. This desideratum is effected by the tent pole, which is made in two sections, telescoping into each other and carrying a screw and nut, by means of which the pole can be raised or lowered and the canvas tightened or loosened as required. It is needless to point out to *connoisseurs* the immense advantages of this improvement, and we therefore say no more on the subject except to invite personal inspection of it in actual operation. By this admirable invention Mr. Lewis also realizes another great desideratum of tent life, namely, thorough ventilation without exposing the inmates to discomforts attending the present unsatisfactory modes of ventilation. By means of his simple contrivance, which consists of two movable hoods that can be wholly or partially opened or closed from the interior of the tents, the most complete circulation of fresh air is secured, the exterior hood also acting as an awning to exclude sun or rain, and as windows to shoot from or to supply a view of the surroundings. Both these important inventions are adjustable to any form of tent, and certainly deserve the widest adoption.

"If the halliards of a tent slacken or if the canvas becomes loose, the tightening and readjusting have hitherto been done from the outside. In stormy weather or on a cold rainy night, it is far from pleasant to have to turn out and expose yourself to the weather while slacking the halliards of the tent. The tent pole shown in cut furnishes the means of tightening or slacking the tent from the interior. The upper section of the pole telescopes into the lower, carries a screw and by means of a nut bearing on the top of the lower section of the pole it can be raised or lowered as required. A jointed handle is pivoted to the nut and is held by a spring in a position at right angles to the pole or parallel with it. This keeps it stationary in either the working position or out of the way as desired.

"The ventilator consists of two movable hoods that can be opened or closed from the interior of the tent. The inner one by an endless cord can be opened or shut or kept partially opened as desired, while the exterior hood acts as an awning to exclude the sun or rain. With this ventilator occupants of the tent may smoke without giving offense, as there is always a current of fresh air. When cold the ventilator can be entirely closed.

SAIL PLAN OF CANOE "NOTUS."

THE SAIL PLAN OF THE NOTUS.

THE accompanying cut shows the sail plan of the canoe Notus, designed by Com. Gibson and illustrated in the FOREST AND STREAM of May 19, 1887. The sails are those used at the last meet in all the races, including that for the A. C. A. trophy, won for the second time by Com. Gibson. The material is bleached muslin in one width, the edges being bound with wide tape. The battens fit in pockets in the usual manner. The spars are very light, the masts 2in. square at deck, tapering to ¾in. diameter at head, the main boom 1½in. diameter, battens ½in. thick. The dimensions of sails and spars are:

	Main.	Mizen.
Mast, deck to head	13ft. 9in.	6ft. 4in.
Sail, on foot	9ft.	6ft. 9in.
Along first batten	8ft. 8in.	6ft. 6in.
Along second batten	8ft.	
Luff	13ft.	10ft. 6in.
Leech, total	14ft. 7in.	11ft. 8in.
Leech, above batten	10ft. 3in.	9ft. 6in.
Spacing of battens, fore end	1ft. 11in.	1ft. 11in.
Spacing of battens, after end	1ft. 1½in.	2ft. 1½in.
Area, square feet	69ft.	39ft.

The first reef leaves 52ft. in main and 26ft. in mizen, the second reef leaves 35ft. in main. The mizen can be stepped forward and a storm mizen added. The luff of the mainsail is roached 4in. in 13ft. and the luff of the mizen in the same proportion. The usual reefgear is added. The sails are hoisted by halliards and lowered with downhauls, the attachment to the mast being by a lacing, as shown. This lacing is similar to the ordinary hammock or netting stitch, the loop or mesh loosening as soon as the halliard is cast off, but as the latter is hauled taut the meshes lengthen and draw the luff closely to the mast. Notus has just been sold to Rear-Com. R. W. Bailey.

THE SENECA IN COMMISSION.

IT'S so long a time since I read of a single-handed cruise in the FOREST AND STREAM that I begin to wonder if everybody has given up that sort of amusement and has taken to racing. What's "Nessmuk" doing? Have rheumatics laid the old fellow up? And Bishop's cranberry plantation has taken all his time, I suppose, although I hear he is going Florida-way this winter. For myself, I've boxed about the Lower Bay, the Upper Bay and the Hudson on five-day cruises, four-day cruises, three-day, two-day and one-day cruises ever since the ice broke up last spring, to very small satisfaction, because as soon as I got anywhere I had to 'bout ship and come back. But now I can see about two weeks coming along in October during which no civilization cares will bother me, and I propose to put in those two weeks aboard the Barnegat cruiser Seneca in a quiet, lazy way, hunting a little, fishing a little, crabbing some, sailing a good deal, and cooking and eating and sleeping a heap, so that I will get nice and tough before I have to encounter a cold winter in Jersey. I'm not going far, and I'm not going fast. I shall coast along the north shore of Monmouth county, New Jersey, exploring every river and creek as far up as a draft of 5in. will allow; shall halt at Navesink Highlands, where there's a big wood with big fat gray squirrels living in 'em, for a few days; shall lay close to Sandy Hook for awhile to shoot some snipe and plover for a broil over hard wood coals, and I may ship the Seneca from Branchport to Bay Head, and cruise about Barnegat Bay to look for ducks. At any rate,

Blow high or blow low,
Rain, shine, sleet or snow,

I'll have a good time, away from railroads and unventilated houses, and table-cloths, and boiled shirts, and mirrors, and people whose highest thought is the "pinching" of the dollar of their neighbor.

The Seneca rides in front of honest old Pop Applegate's inn on Cheesequake Creek, her stern anchored out and her nose tied to a stake ashore. She is "in commission" from April to December, provisioned and fitted for weighing anchor and cruising away for a month at a moment's notice. There's no anticipatory "getting ready" for a cruise in her, because she's always ready. I have only to haul her ashore by the bowline; slide the two hatches off her cockpit; lift out of her interior, mast, sail, boathook, rudder, tiller and oars; put the aft hatch on the stern deck, the fore hatch on her floor inside; haul out the clothes bag from the port side of the centerboard and exchange shore apparel for cruising togs; take the two water jugs to the spring and fill them; put a few extras like vegetables or canned goods in the stern cuddy; haul up anchor and drop down stream under two bridges and out into the broad bay for a week, or a month, or longer if circumstances permit. And there isn't another craft of her size afloat that is handier, safer, pleasanter under sail or oars, or so comfortable a cruiser altogether as my little 14ft. singlehander.

It may interest FOREST AND STREAM readers to describe the arrangement of the outfit of the Seneca when afloat. Beginning at the stem, she is decked over 5ft. 10in. The centerboard trunk begins 3ft. 1in. from the bow and ends at the fore end of the cockpit. Between the stem and the centerboard trunk are an extra coil of rope and an extra coffee-pot and tin pail. A shrimp net with handle and a jointed fishing rod also occupy part of this space, and extend part way alongside the starboard side of the trunk aft. To the starboard of the trunk, in easy reach of the cockpit, are two small oil stoves and a can of kerosene oil, also a brass rod which is used to shove down the centerboard. On the port side of the trunk are the clothes bag and the granite-ware cooking utensils, kettle, coffee-pot, three cups and three plates. The cockpit tent is folded up on the floor close to the after end of the trunk, and next comes a tin water-tight box with the rubber bag of bedding atop of it, which is used as a seat when rowing.

The box is divided into compartments. No. 1 compartment contains awl, gimlet, screwdriver, nippers, oyster knife, cartridge loading tools, brass screws, screweyes, brass and galvanized blocks, safety-pin hooks, nails, rings, spare cleats, tacks, etc. No. 2 compartment contains unloaded shells. No. 3, loaded shells. No. 4, fishing tackle of all kinds, small mirror, comb, thread and needles. No. 5 contains gun-cleaning tips, waste, rags and a bottle of gun oil. In the cover of the box a jointed cleaning rod is held by springs. In the rubber bedding bag are mosquito netting, two blankets, a quilt and a thick carriage robe, and perhaps an extra flannel shirt or two that can't be crowded into the clothes bag. Between this seat and the after end of cockpit is a clear space in which to "work ship."

The after deck is 3ft. long, covering a 2ft. cuddy and a foot of room below decks. In the latter space are stowed the two water jugs, a rubber inflatable mattress, a rubber coat and a macintosh-covered basket containing bread, pilot biscuit, cheese, etc. In the stern cuddy are canned soups, canned plum puddings, sardines, and other tinned edibles, potatoes or other vegetables in water-proof muslin bags; a candle lantern, riding light, and odds and ends of all descriptions. Underneath the side decks on either side of the cockpit are little shelves between every two deck braces. There are seven of these shelves on each side, which, numbered from the stern, are occupied as follows:

	Port.	Starboard.
1	Bag of shot	Bag of shot.
	Can of powder	Revolver.
	Soap, sponge	Pipe, tobacco.
2	Whisk broom	Box of matches.
	Scrub brush.	
	Monkey wrench	Hatch padlock.
3	Can opener, big	Case-knife, fork.
	Spoon, pliers	Three tea spoons.
	Coffee can	Sugar can.
4	Salt can	Condensed milk.
	Pepper box	Bottle chow-chow.
5	Generally vacant, the bedding bag preventing easy access.	
	Spare rowlocks	Hatchet.
6	Spare blocks.	
	Candles.	
	Towels	Grub in general.
7	Slippers.	

The gun lies on the floor under starboard side deck and the skipper's artificial aids to walking under port side deck. On deck, between stem and mast, 2ft. 9in., is coiled the anchor cable, with Chester folding 12lb. anchor. On side decks, where the 6in. high washboard prevents their rolling off, are the oars, boathook, mast and sail when not in use. A stern cable is coiled on after deck.

In sailing a long handle tiller is used, so that steering can be done from the cockpit, but under certain conditions the skipper steers from the after deck, with the tiller put on the rudder head "stern foremost," the handle sticking out astern like a boomkin. The cruising sail generally used is a spritsail, which can be stowed below, the hatches put on and locked, and the cruiser left at any port with everything in her, while the skipper takes the train home to spend Sunday with his family.

With such arrangements as the above the skipper lives aboard his boat, sometimes not touching shore for three or four days. Sitting on her oilcloth-covered floor to cook a meal, he can reach everything necessary without moving his position; sitting there at night with the tent up he has 4ft. of headroom in a waterproof cabin, which can be made warm and cosy in December by keeping one of the oil stoves alight; and anchored at night in a cove he sleeps like a top on a soft "air mattress," rocked gently by the waves.

Who wants a yacht when he can have as weatherly, comfortable and good sailing a craft as the Seneca for a tenth of yacht price? And who wants a canoe for cruising on open waters when he can have for equal cost a Barnegat cruiser, which is safer and more comfortable, as fast a sailer and as easily propelled with a "spruce breeze?"

I have had both canoe and yacht, and I prefer the SENECA.

OLD-TIME PLEASURE BOATS.

THE interest expressed in my "old-time sailboats" prompts me to record the doings of the early rowing clubs.

Happening to be in New York city in the spring of 1835, on an evening I wandered down to the Battery, where I saw the boat clubs rowing in their light and elegant barges, but of substantial build—the shells had not then come in. Around the circular outer wall of Castle Garden was a row of iron cranes, to which were hanging several barges, and from others dangled the tackles for hoisting similar boats to their places. These boats were a new revelation for me. I already had a small sailboat, but the sight of this fleet of light rowboats created a new want. At Holt's marble hotel, then new, where I stopped, were several Portland young men, one of whom was James Appleton, Jr., a watchmaker. The next evening I took him down to the Battery to see the boats, but could not raise much enthusiasm in him except a promise to take a share if I would build a boat.

In a day or two some four or five of us left for home in the steamboat President, Captain Comstock, then by courtesy styled Commodore. With the Providence, Captain Thayer, the President formed a daily line to Providence, where numerous stage coaches took the passengers to Boston, forty miles. While on board the boat on the Sound, an agreement was made by several of the party to build a light barge like those of the New York clubs. After our arrival home the writer waited for some one to move in the matter of the rowing club. On inquiry he soon learned that the interest expressed on board the President had cooled off. There was one who was determined to have a club barge and trust to a revival of the interest on seeing the boat in the water for assistance in the project.

The first move was to find a builder who would undertake the job, and to be under the direction of the writer, who had made measurements and drawings from the New York boats. William Wallace, the boat builder, who died a few weeks ago at Cape Elizabeth, at the age of 85, then had a shop on Portland Pier, and undertook the job. The barge was to be of the lap-streak build, but no cedar boards like those of which the New York boats were built could be had here. Half-inch pine boards from small trees, they being tougher, were used. The boat was to be 35ft. long and a little over 3ft. beam, with thwarts for eight oarsmen. I did not

like the click of the New York men's oars in the rowlocks at each stroke, and substituted brass rowlocks to turn in the gunwale fitting the oar, which effectually prevented the disagreeable click.

After the same kind of discouragements which Noah probably experienced in building the ark, the barge was ready to paint. This was done by Wm. Capen, the sign painter of "log cabin" memory, who was the first to encourage the owner in his undertaking. Capen had his choice of the colors and style of painting, and chose pea green for the outside with a narrow black and gilt stripe. Capen's shop was in the third story of the "Insurance building," then on the site of the present Bailey & Noyes building in Exchange street. Judge Mellen had his law office in the second story, directly under the paint shop. The year before, the Judge had attained to the age of 70 years and had become constitutionally disqualified to hold the office of justice of the Supreme Court. This undoubtedly caused him to be irritable. The noise made in turning the boat in the process of painting, and that made by those attracted to look at it, very much disturbed the Judge, who frequently went up stairs and opened the door to complain. Finally, when the stripes were on, the burnished brass rowlocks and the showy stern cushions were in place, the Judge came up one morning to complain, but his eye caught sight of the barge and he stepped in to examine, and was so well pleased with the barge that all his bitterness died out, and he apologized for his impatience and told us to make all the noise we liked.

There was now no difficulty in forming the club and getting the shares taken. The barge was named The Eagle, and when finished was launched out of a three story window into Exchange street and hauled to Ingraham's, now Commercial wharf, and placed in the water. We were all there, with our oars, intending to make a trial trip, but as there was rough water outside of the dock, and the boat looked so frail, and set so light on the water, we hesitated to launch away. Much to our relief at that moment, Captain Green Walden, of the revenue cutter Morris, came into the dock in his barge. We asked the captain to put his oarsmen into the new barge and try her, which he readily did, and to assure us of her safety he got in himself as coxswain. He put the boat into every possible relation to the sea in the harbor, with a sweep that overcame our timidity, and a half dozen of the new Eagle Boat Club took their places in the barge, and this was the first rowing club afloat in Portland harbor. Some of us could row, but some of the crew were powerless to keep stroke, lifted their oars high and awkwardly out of water, and often "caught a crab." Feathering was an after accomplishment, which was soon learned.

The Eagle was not modelled for speed only, but for a comfortable boat to take our lady friends for an evening's excursion in calm weather, where the singing of the Canadian boat song and kindred productions could be enjoyed. As we became proficient in rowing, a desire for something to row with developed. The only boats that could approach our speed on a trial were the revenue cutter's and the port barges, with those of an occasional man-of-war that came in. The ownership of the barge was changed after a year or two, and she was finally shipped for Cuba and was lost off the deck of the vessel in a storm.

I commenced to write this sketch with many pleasant recollections, but when I come to try to recall the members of the club at its formation, I find not one alive but myself. Of the original members I recollect Abner Lowell, James Appleten, Jr., Wm. Capen, Charles F. Little. All have passed away, and, like Job's servant, "I alone am left to tell of it."

The next rowing club after the Eagle, as I recollect, was composed of Neal Dow, Abner Lowell and others, who obtained a boat in Boston, a white barge, which they named the Nautilus. They went on an excursion to Bath, where she was maliciously damaged by having a hole cut in her bow in the night, which caused much excitement in that town. The passage home was made in a steamboat.

The purchasing of the Nautilus in Boston caused an ill-feeling among boatbuilders and boatmen here, and a club was formed of which the following were some of the members: George A. Churchill, Amos Warren, Joshua and Charles Safford, E. M. Patten, Thos. O. and John F. Gould. They employed Thos. F. Roberts to build them a barge 40ft. long and to row ten oars. True to their home pride, she was called the Portland. This was in 1838. The Mechanics' Association held their first fair that year, filling the three stories of the present much-abused Old City Hall. The splendid barge Portland with two hand fire engines, one from Philadelphia and one from Boston, occupied the lower story. A silver medal was awarded to Roberts for his barge. The Portland was taken to Boston by her owners and was entered for a race with several Massachusetts boats. She was leading the fleet with her builder steering, when a pilot boat came across her bow and obliged her helmsman to alter her course or be run down. By this she lost the first, but took the second prize. With the advent of the Portland came bitter spirit of rivalry among oarsmen, and the championship of the harbor was warmly contested.

The Wave came next after the Portland and after her all is blank to me.—*Hon. Wm. Gould, in Portland Daily Press.*

PASSAIC CANOEING.—The Ianthe C. C. lately held a water carnival, the fleet turning out by night with Chinese lanterns on each canoe. A number of visitors were present at the club house to view the procession, in which members of the Essex, Rutherford and Arlington clubs took part.

A craft, the description of which equals anything to be found in the pages of Jules Verne's eccentric writings, is at present under construction in this city. The craft may be described as a "catamaran," or steam launch built of steel, with two cigar-shaped hulls, each about 65 feet in length, with a deck binding the two hulls together. Each hull is built in two compartments, one of which is to be used for water ballast and the other as a reservoir of coal oil—the latter being used for fuel. The motive power is obtained from two vertical engines and two propellers, the shafts of the latter being so arranged as to lift themselves out of the way on striking floating ice or any other obstacle. The boat is intended for whales, walrus, and seal hunting in the Arctic, and will be furnished with a Gatling gun as well as a powerful electric battery, sufficiently strong to paralyze any aquatic mammal extant. The boat is said to be a copy of a German invention. It will be taken apart when finished and packed for transportation on board the whaler to which it is an accessory.—*Montreal Witness.*

LYNCH'S STATION, Va., Oct. 6, 1887.

U. S. Cartridge Co., Lowell, Mass.:

DEAR SIRS—After a thorough test of your shells, *I find their primers* better suited to develop *Schultze Powder* than any shells made in this country, and shall use them exclusively in my shooting. Yours truly, (Signed) W. T. MITCHELL. —*Adv.*

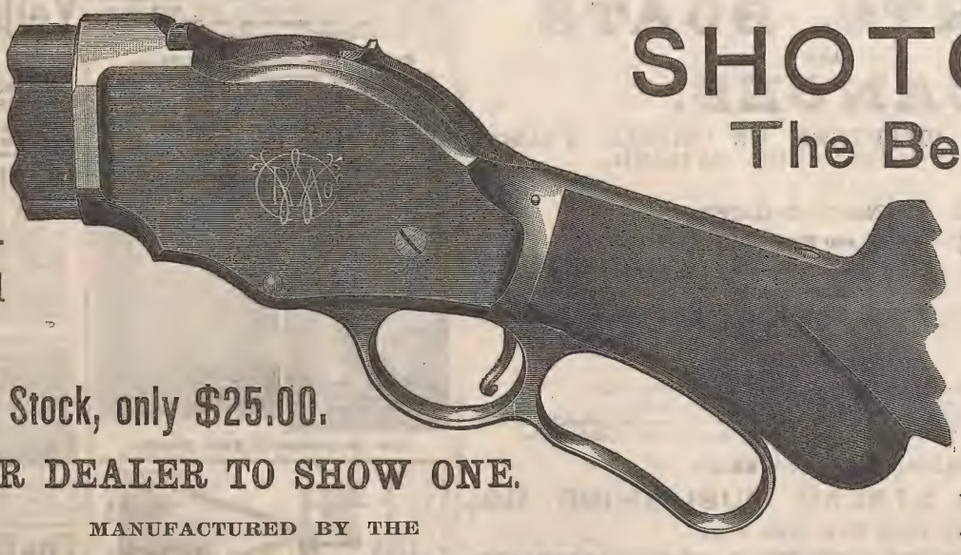
"Highest Quality" Fish Hooks.



Anglers are so familiar with our name and Trade Mark and the quality of our goods, that we have no hesitation in calling them to witness to the excellence of all hooks made by us. Though our hooks have always been fully equal to any ever made, about seven years ago we came to the conclusion that anglers would welcome a very high grade of fish hooks—something far beyond what they had ever used. Consequently we perfected arrangements for the manufacture of what has become so widely and favorably known as "Abbey & Imbrie's Highest Quality" fish hooks. All boxes containing these hooks have our trade mark and the words "Abbey & Imbrie's Highest Quality," distinctly printed on the label. Also the name of the hook, viz.: "Sproat," "O'Shaughnessey," "Aberdeen," "Carlisle," "Sneck Kendall," or "American Trout." When "snelled" on silk worm gut or gimp the hooks are put up in packages containing one-half dozen of hooks. Each one-half dozen is labeled.

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for our 120-page illustrated catalogue.

Scotch Cutter Thistle,

LITHOGRAPHED IN COLORS FROM A PAINTING BY THE CELEBRATED MARINE ARTIST BARLOW MOORE.

Thistle is represented in broadside view, heeling over to a full press of sail in the Royal Harwich regatta. Irex is also shown under the lee, with Wendur and Genesta following.

Size 24×15, with 4-inch margin for framing. Price $3.00 each.

Forest and Stream Publishing Co.
NEW YORK CITY.

The Forest Waters the Farm;

OR,

The Value of Woodlands as Reservoirs.

BEING THE LES ÉTUDES DE MAITRE PIERRE SUR L'AGRICULTURE ET LES FORETS.

PAR M. ANTONIN ROUSSET.

Translated by
REV. S. W. POWELL.

The introduction reviews the extraordinary movement of torrent taming in France, in preparing public sentiment for which the Studies of Master Peter played a noteworthy part. The book was written as a sort of science primer, setting forth the first principles of the relations existing between woodlands and agriculture. The principles and reasoning are not less applicable to the United States to-day than to France then.

Price in cloth, 75 cts.; paper, 50 cts.

A NOTABLE ART ENTERPRISE!

The Sportsman's Reverie.

A SERIES OF PICTURES FOR SPORTSMEN.

READERS of the FOREST AND STREAM cannot fail to recollect Mr. Thomas F. Watson's poem entitled, "The Sportsman's Reverie," printed in this journal about two years ago. Later on a few stanzas were added to cover other scenes of typical American sport with the gun. The author depicted vividly the varied visions which come before the view of the veteran sportsman as he sits in easy chair before the fire. Of the author and his poem the *Detroit Free Press* said in an appreciative notice: "The author is evidently a man of the most acute sportsmanly enthusiasm, as well as of nice literary taste. His poem is built upon a very simple plan. Before a cheerful fire—like Ike Marvel's hero—sits a veteran of rod and gun; he grows half drowsy over pipe and fire and the poet has caught—with a nice and sensitive appreciation—the reminiscences of a hundred hunts which flit through his brain. One experience after another is described with graceful pen touches; the quail, the woodcock, the snipe, the deer, fall before the crack of the gun; a long day's sport—a glorious day such as no man ever compassed between sun and sun—is described, even the trout, from the clear rapid, paying tribute to the prowess of a dreamland sportsman, until at last, with the fall of the quiet night shadows, the sportsman draws his boat to the shore, his tired retriever crouches at his feet, and, with his ducks, the final trophies of his sport, at his side, he looks back over the darkening water; and then, once again at his fireside, the end of the vision comes naturally and gracefully."

And now these "word pictures" of the poet have been complemented with the actual canvas pictures of the painter. Artist-poet and poet-artist have united to give us the poem in a magnificent setting. Mr. Robert Hopkin, the celebrated artist of Detroit, has painted a series of twelve pictures, each telling in color what the poem tells in words. From these paintings have been made superb heliotype engravings, each having beneath it the particular verse of the poem illustrated. The series is remarkable for strict adherence to nature, fidelity in portraying action, and artistic merit.

THE TWELVE PICTURES:

No. 1 shows the hunter seated in an easy attitude in an arm chair, gazing reflectively into the fire on the hearth. Above the fireplace are the head and antlers of a deer. The sportsman's right arm is around the neck of his dog, which is resting on his haunches beside the chair. His left hand holds his pipe. The firelight flickers on the floor and around the legs of the chair.

No. 2 represents dawn breaking over a small lake. The night shades are fleeing. A mist is rising from the eastern end of the lake, of which trees fringe the edge. A plover is circling in the air, and in the foreground is a mallard lazily flying out over the glassy water.

No. 3 represents snipe shooting. In the foreground is the sportsman, his body twisted around to the left in the attitude of making a double on snipe. Standing beside him is the setter, waiting for the word to retrieve. To his right is the border of a wood, the branches bending to the strong wind. In the distance are the sails of craft on the lake.

No. 4—woodcock shooting—shows an opening in the copse around whose border a brook is winding. In the foreground, standing deep in the ferns and rank vegetation, is a setter on a point. Behind the dog is the sportsman in the attitude of shooting at a bird flying directly over him.

No. 5 shows a quail hunter in the foreground, walking along ready for the shot, which will follow the rise of the birds, on which the dog is drawing to a point. A haze is over all, and the sky is that of a day in Indian summer.

No. 6 depicts grouse or partridge shooting in the beech woods. The hunter is walking down a slope. The dog has come to a point ahead of him. The bird has flushed and the hunter is shown aiming. The pointer has stiffened into an attitude of strained attention, as he watches the bird fly away. The upper part of the sportsman's body is in the shadow, the lower part in the strong light of the sun rays.

No. 7 shows an angler reeling in a trout. A brook is tumbling down through the woods and over the rocks into the pool. The sky is cloudy and the sunlight is struggling through.

No. 8—deer shooting—is a forest scene. In the foreground a buck, just shot, is falling on the edge of a lake. Tearing down the slope behind him are two hounds. To the left, behind the roots of an upturned tree, are seen the head and shoulders of the hunter, whose rifle is still bearing on the deer.

No. 9 represents shooting over decoys. A gale is blowing and the water of the channel outside is lashed into whitecaps. In the bay the decoys are tossing in the chopping waves. In the foreground is a point of rushes, in which the skiff of the hunter is partially concealed. The flock of ducks, which has just swung in outside the decoys, is broken by the discharge of the first barrel. One section is wheeling out over the river. The other has broken off to the side and is wheeling out again to meet the first section. Some scattered birds are dashing above the head of the hunter, and he is twisted around in his skiff aiming at a bird flying above and behind him.

No. 10 shows flight duck shooting. The scene is a marsh, on whose broken surface the sun is setting behind the clouds. In the foreground, on a grassy point, are the hunter and his spaniel. The hunter is in a kneeling attitude and in the act of firing his first barrel. The spaniel is plunging into the water to retrieve the bird which has fallen to the first barrel. In the distance are flying ducks.

Nos. 11 and 12 represent the hunter retiring from the marsh and at home, and these two are among the strongest of the set.

The pictures are printed on the best 150lb. plate paper; size of paper 24×30in.; size of print 14½×17½in. The pictures have the tint and tint border, and the artist's remarque and signature, and form artist's proofs, an édition de luxe.

PRICE, $30 FOR THE SET; SINGLE PICTURES, $3.

ANSWERS TO CORRESPONDENTS.

THE PROPOSED MONUMENT TO AUDUBON.

AT the recent meeting in New York of the American Association for the Advancement of Science, the fact that the remains of the great naturalist Audubon lie in an obscure and little visited portion of Trinity Cemetery, New York city, and that his tomb is unmarked by any distinguishing monument, was brought to the attention of the members. The demands upon the time of all in attendance at that meeting were so great, that no action was taken by the Association, although the most lively interest was expressed by individual members, and the propriety of marking the resting place of the founder of American ornithology by a suitable monument was appreciated.

The Audubon plot in Trinity Cemetery will probably be disturbed by the continuation westward of One Hundred and Fifty-third street. The trustees of the cemetery have with commendable liberality assigned the Audubon family a new lot close to One Hundred and Fifty-fifth street, in full sight of Audubon Park, and near the end of Audubon avenue, when this shall be continued from the north; and they are in hearty coöperation with the monument enterprise.

At the first autumn meeting of the New York Academy of Sciences, a committee was appointed to solicit funds, and make all arrangements for a monument. Vice-President Trowbridge then appointed as the committee, Prof. Thomas Egleston of the School of Mines, Chairman; Prof. Daniel Martin of Rutgers Female College, and Dr. N. L. Britton of Columbia College. This committee has organized with Dr. Britton as secretary and treasurer, and is now ready to receive subscriptions, which will be properly acknowledged, Checks should be made payable to N. L. Britton, treasurer; and post office orders should be drawn on Station H, New York city.

The committee estimates that between $6,000 and $10,000 will be required to erect and engrave a shaft worthy the memory of America's great naturalist, and while confident that this amount will be forthcoming, desires to have interest taken in the project by scientists in all departments in all portions of the country.

LOCAL AND NATIONAL SHOOTS.

THE Chicago rifle meeting, of which the final report appears in our present issue, is significant in that it drew together marksmen from the East and their fellows from the West. It had the appearance of a Creedmoor of a few years ago, and the results are highly gratifying from a shooting point of view. The Massachusetts team showed what persistency of practice and intelligent study of the science of fine shooting can do, while these Bay State shooters found when they reached the West that there were others than themselves who were experts in holding, had given time and patient study to the captivating art and were very satisfactory rivals. It was a good and profitable experience for all who took part and is particularly encouraging to those who rightly think that a strong love for and proficiency with small arms is a great national safeguard.

The Chicago meeting is interesting in another aspect. It truly deserved the name of a national gathering. There have been many attempts to make some sort of national gathering of marksmen, either with the rifle or the shotgun, an annual event. These endeavors have not been very satisfactory and their promoters have not been much encouraged. The fault seems to lie in a misconception of the motives which lead men to go into contests of this sort. Apart from the "boodle" hunter who would go to the end of the earth if the "pot" was large enough, there is the great company of truly amateur shooters. These do not expect to pay their way from the proceeds of their sport. They shoot from love of the sport, because they feel better after a good day's hard work before butts or trap; and then they love to come together in meetings to gratify the pugnacity which is at the bottom of every rightly constituted human organism. Man is a fighting animal and the score makes a capital battle ground.

Why, then, do we not have frequent national meetings? Why do not the trap-shooters come together in grand conflicts and enjoy their combative bent to the top? Simply because in these wholesale struggles almost all the keen enjoyment of the conflict is lost. Local matches are fought out day after day, dozens of them every day in various parts of the country. It is more pleasure for the crack shooting squad of Squn Point to beat the crack squad of Squn Centre, and to do the fighting right then and there with their respective admirers about to enjoy the fight and applaud the winners, than it is for either of the teams to get lost in a rift of shooting groups at a National meet. It is easy to get up a shoot between company teams in the same regiment, while it would be difficult to get up a regimental team to go off a hundred miles to meet a stranger foe.

As we have said, the great bulk of the shooters are amateurs, and the money question involved in the preparation and carrying out of any participation in a national shoot is an important one; but even with the same outlay we think that the popular preference is so strongly shown for these local shoots that they will always hold their own, while the national or international gatherings will come only at rare intervals, and be brought about by some special circumstances.

It is a favorite notion of some that the United States should show such an annual gathering as that at Wimbledon. That each State should have its own State meeting, and that then there should be a rush of team and individual shooters to the central gatherings. If there is to be such an institution as Wimbledon in the United States, it will not come for a long time, if ever. The geography of the country is against it. A man may pack up his traps after dinner and find himself ready for work on the London Common the next morning, and this from any part of the kingdom. Not so in the United States. Then there is a large leisure class there, and one intensely fond of sport of any sort. As yet we have not that class in America. Moreover, the English Volunteer movement came into being under the pressure of a grand national scare, and it has been kept up by careful nurture. In the United States our free and easy indifference to the possibility of any national trouble is against the formation of a militia, and the Government does next to nothing in the way of encouragement or support. Hence it is that our National Guard is a most fragmentary sort of an organization. Now and then there will be spasmodic efforts toward a national tir or general shooting festival but the conditions are not yet favorable for making it in any wise a permanent institution.

There is no lack of opportunity for those who would enjoy the rivalry of bullseyes and blue rocks. Let any dozen men get up a club in any village of the United States and issue a challenge to their next neighbor village, and we think it safe to wager that a match will be the result. So the old rivalry between California and Nevada is kept up. The Gulf States sustain a series of tournaments. Through the Western States there is a standing and well sustained struggle, while in New England minor matches come with more than weekly regularity. All this means that there is a wide and widening circle of men, who year by year know more of shooting. They demand a better class of arm. They point out from their own experience the faults of the present weapons and thus keep the inventive talent in continuous working order, and when the time ever comes with a demand for marksmen, Uncle Sam may rely upon a generous response from every part of his domain.

EXPERIMENTS WITH VENOM.

A VERY interesting series of experiments has been instituted by Dr. H. C. Yarrow, of the Smithsonian Institution, with a view to discover an antidote for the venom of the rattlesnake. Some years ago, it will be remembered, Dr. J. B. de Lacerdo, of Brazil, published an account of experiments made by him, which had shown the antidotical efficacy of permanganate of potassium injected into the bite. Subsequent experiments in France, based on those of Dr. de Lacerdo, failed to give the results expected; and now Dr. Yarrow is to repeat the tests in this country. His experiments will not be confined to the permanganate of potassium; but he has collected all available herbal preparations and other cures reputed to possess curative virtues, not omitting a "madstone." All these will be thoroughly tried. The experiments will be made on pigeons and rabbits; the subject will first be poisoned by a hypodermic injection of rattlesnake virus, and then the antidote to be tested will be given in the same way. For his virus supply Dr. Yarrow has secured a number of large snakes; they are made to strike at a bit of cotton wool saturated with glycerine; when the wool is saturated with venom the poison is soaked out in glycerine, and in this way the experimentalist has already secured enough to kill thirty men. The result of Dr. Yarrow's tests will be looked for with a great deal of interest.

NOTES AND COMMENTS.

WE recently commented on an illicit mode of trout fishing practiced at the Upper Dam, Rangeley Lakes, Maine. The names of two individuals were mentioned. From one of them a disclaimer was received and promptly published in the next number. To conclude from printed comments and innuendoes on our course in this matter, it would seem that there is held to be by some people only one important question involved here. It is not "were the trout jigged?" nor "was the vice-president of an angling association wrongfully accused?" but "will the FOREST AND STREAM be sued for libel?"

A new postal regulation restricts the writing or printing which is permissible on the wrappers of packages of fourth class mail matter. Books are third class mail matter. A copy of the book "Training vs. Breaking" recently sent by mail fully prepaid to a Boston purchaser reached him with a demand for nineteen cents, due on the ground, as explained by the Boston office, that the book was fourth class matter and the printing on the wrapper subjected it to first class rates. Evidently somebody in the Boston office blundered in this. If other recipients are called upon for any extra postage on matter sent from this office we will undertake to find out where the fault lies, provided a statement of the facts is sent to us, accompanied by the wrapper of the package.

American fishing rods are acknowledged by Englishmen to be superior to those of British make. The London *Times* of Oct. 1, in its comments on the international yacht race, expressed this opinion when it said of us: "The truth is that, with them, yacht racing is an even more serious and absorbing pursuit than it is with Englishmen, and when an American devotes himself to the task of practical skill he is apt to be hard to be beat in it. Americans have not so many outdoor pursuits as we have, but such as they have they take very seriously. They have given us the best fishing rods and their skill in casting a fly would put our best anglers on their mettle."

The Sportsman Tourist.

IN THE SAWTOOTH RANGE.—V.

I ROSE early after my long rest. Charles, who was stirring up the low camp-fire, suggested that I might try to get a deer along the river to take down to Bunch's that afternoon. So, after a sip of last night's coffee and a bite of bread, I started, promising to be back early. It was a dark and hazy autumn morning; a heavy mist hung over the river and its banks, on which I leisurely sauntered down to an old deer lick. Having crawled through a patch of thick underbrush, and as I was turning a short bend of the river, I looked back and caught sight of some large animal fording the stream near where it forms an almost right angle, but the overhanging mist and heavy fog obscured my sight so much that I could not c'early see what it was. First I thought it might be one of our horses strayed from the rest. Walking slowly along and keeping my eyes on the straggler, the suddenly increasing light enabled me soon to see that it was no pony, but an immense bear. Meditating a moment, if I had lost any such ugly-looking customer, then studying the unfavorable surroundings and seeing no friendly tree, nothing but brush, willows and a few thin, quaking asps, I thought it wise not to interfere.

The bear had crossed over to my side and shook the water out of his thick fur. I saw now plainly it was a monstrous grizzly.

Though I often wished to meet one I must confess that I did not feel very comfortable at the sudden sight of this bear.

The wind was blowing in my favor and I was almost certain that he had not seen me. I expected to see him put for the nearest gulch as soon as he should get into my tracks, but imagine my surprise when, coming upon my trail he stopped, smelling, then following them as close as a dog would scent a bird. Disappointed in my calculations and peaceful resolutions, I felt quite a little embarrassed, but angry as well; so I made up my mind to shoot at any rate. The old fellow was very cautious and on the *qui vive*. Coming to a stop at the other side of the thicket he gave me a good chance. Taking deliberate aim a little back of his shoulder I turned loose. My aim was true, down he went, but up again in an instant, and jumping into the thicket which separated us. I now began to feel a little nervous, seeing the brute meant fight. Once more I cast a hasty glance for some friendly tree, but there was none near. The bear was working through the brush, as I could plainly see by the swaying and moving branches, but was too much hidden for another successful shot. Seeing a large boulder in the river, an idea struck me. I jumped into the water to hide behind this large rock. The water was only 3 or 4ft. deep, but it was very swift; in fact, the current was so rapid that, trying to get from above behind this boulder, it took me off from my feet, obliging me to wade from below to my shelter. Here I got into pretty deep water, up to my waist. Laboring and straining against the current, I had no sooner ensconced myself in my refuge behind it, than I heard my ugly pursuer plunge in after me, and I must admit I felt scared. Clutching my rifle in one hand and holding on to the boulder with the other, I saw the brute slide by me within 5ft. making for the other side. I could see his wicked bloodshot eyes, and almost feel his hot panting breath. I don't know what prevented him from seeing me. Was he too eager to reach the other shore, where, after hearing me plunge into the water, he expected to find me, or was his sight so impaired by my shot that he could not distinguish me, or was it a providence which saved me? I will never, in all my life, forget those fearful moments.

While he made for the other shore I somewhat recovered and got into shooting position. He was wading up the bank when I fired for the other shoulder. He again broke down with a raging scream, but rising quickly and now seeing me he jumped down the bank and came for me again. I felt that this meant war to the knife. Hastily inserting another cartridge, I fired the third time. He slipped on some stones, and my bullet struck a little too far back. He was evidently getting weak and sick, but his anger and fury increased in wickedness; he rose on his hind feet (as proved later, both of his shoulders were broken), opened his fearful mouth, showing the glittering teeth, as if to swallow me, and dragged himself along with supernatural strength. He was within 15ft. of me when I fired again, and he dropped like a log, clawing, pawing and throwing the water purpled with his life blood all over me. The last bullet had broken his neck, and thanks to my trusted old Sharps I was saved. Hurriedly leaving my watery position for the dry land, I cast one more glance at my vanquished enemy and muttered a threat of relief, "There, you brute, if you don't die now you'll drown sure."

During all the time this deadly encounter lasted I kept pretty cool, never lost my presence of mind, and was fully aware of my perilous position; but after the excitement was over the reaction set in, my nerves, strained to the utmost, began to relapse; and being wet through and through, I reached camp in a pretty high fever. Changing my soaked garments and taking a cup of tea, I managed to relate my adventure. At the mention of "grizzly" an incredulous smile stole over their faces. But when later on in the evening I took them to the field of battle, had my satisfaction when I asked if I had exaggerated. They both pronounced him a regular "California grizzly," and a perfect monster; in all their time in the Territory they had never seen one before.

I regret that we had no facilities to weigh the old fellow. Having read so much, pro and con, on the weight of grizzlies, and as I am not exempt from the proclivities of a sportsman, I think it safer not to express my opinion; but suffice it to say that three of us were not able to get him out of the water. We managed to move him into a shallow spot and were obliged to skin him there. His skin with the head attached made quite a formidable load for one of our ponies.

It is simply incredible what tenacity of life this animal possessed, all my shots were fatal, the first through his right, the second through his left shoulder, one of them piercing the lower part of his heart; the third was through the intestines, and the *coup de grace* dislocated his neck. On skinning his right foreleg we found that he had been in battle before, for it had been broken by a bullet, but had knitted together again and was twice the size of the other leg. After removing his hide we looked with amazement at the carcass, almost startling in its resemblance to the body of a human being. His wide breast and body muscles were spread out like whip cords, and on his arms they stood out like an athlete's. He was a perfect grizzly Sullivan.

The next morning we packed up and in the afternoon went down to the cabin of Bunch, who had promised to go with us to the middle fork of the Payette for elk. We took provisions to last a week. Getting to Pinney's ranch by noon, we stopped to see the old gentleman; he was out, but finding the larder well supplied we invited ourselves to lunch. He came in before we had finished, and expressed himself as glad that we had made ourselves at home. Promising to bring him some elk, we continued our travel along the fork to Boon's logging cabin, where we camped. We spent a most pleasant evening, enjoying the recital of his numerous adventures in the forests and mountains.

He had just had a narrow escape. Coming home from some logging inspection, as he was making his way through a thicket, he rode plump upon a feeding brown bear and a cub. The frightened horse reared and threw Boon, who landed right in front of the bear, which was also greatly surprised. He carried a short carbine in his hand, with this he gave the astonished brute a terrible whack over the head, stunning him momentarily. Then Boon skinned up the nearest tree in great haste. The weight of the blow had broken the stock of the gun; and though he tried to doctor the damage to use it from his lofty position, he could not make it work. Old Eph after arousing himself put off for the nearest gulch, without inquiring what or who had struck him.

Sunday we left Boon and camped nine or ten miles higher up the river, where we noticed fresh elk sign. Monday and Tuesday Bunch, Charles, Billy and myself hunted around the vicinity but with no success. The two brothers decided to go back the next day to finish their cabin, while Bunch and I were to go into a high mountain valley which he had prospected the year before and where he had seen a great many elk. We were fully aware of the risk we ran if a snowstorm should overtake us. The valley was almost unknown; there was no trail to it, and we had to feel our way amid the cañons and gulches to the summit, and then down the steep and dangerous decline, on which we started a small band of elk, but as we were paying all attention to our treacherous decant, they got away unmolested. At last we were down and camped near a large sulphur hot spring. In the morning we went up the valley to look for elk, finding perfect cattle yards of signs; but we did not run on any until afternoon, when, coming upon an opening, we saw a large bull going with swinging gait up the next ridge. How his magnificent antlers showed in the light horizontal background when he reached the open summit. Stopping to look back from the knife-blade ridge he presented a most striking picture, for a moment, then disappeared on the other side. Bunch and I now hurried to the next ridge, and on the summit we separated, I to go down a park-like meadow, while he kept on the side of the mountain. Crossing a little creek I noticed very fresh signs; following those with noiseless steps I soon saw the large bull, not a hundred yards away, going up the side of the ridge. At the crack of my rifle he gave one sudden bound and kept going, and I managed to get another shot before he disappeared in the timber. He was heading right in the direction of Bunch, who must have heard my shooting, and put himself on the alert. But not hearing his rifle after some waiting, I followed the tracks to see if I had hit the elk. Yes! here was blood, he was bleeding pretty freely. Trailing him up, I heard Bunch's hail and query if I had killed. I told him I had wounded one severely and to be on the lookout. Suddenly he shouted, "There he goes!" and sure enough, driven back out the timber by Bunch came the elk. He gave me a splendid opportunity, and after two more bullets rolled over. It was a fine specimen of our noblest game, American elk or wapiti deer (*Cervus canadensis*), but his antlers were smaller than I anticipated.

Dressing the bull I was somewhat puzzled at finding only two bullet holes. My last two shots were not fired at more than 60 or 70yds. distance and could not have missed him, and I was also positive I hit him with one of my first, as the bloody trail surely indicated. To convince myself I followed the first track of blood, going into a network of brush and low-branched pines, where to my greatest surprise I found another elk lying dead before me. This one was by far the larger of the two. His immense antlers were the longest (56in. from base) and the most graceful and symmetrical I ever saw. He is looking down at me now while I am writing this, a cherished trophy of my last hunt.

We managed to pack out the antlers, intending to come after the meat the next day; but rising early we found everything covered with snow which was still coming down in great flakes. This kept us in camp, through the forenoon, and in the afternoon Bunch set out to explore down the valley to see if he could find a better way out than the way we had come. I crossed the fork and went to the opposite ridges until I came to the upper end, but without seeing any game, though there were numbers of fresh signs in the snow. The snow had turned into a drizzling rain, making tracking difficult and disagreeable so I make direction for camp. Having recrossed the fork, I was on the side of our camp and on which we had come down the day before.

Remembering distinctly a creek we had crossed I was positive that I was going in the right direction, but when I came to the fork to my utter astonishment I found that instead of running down it ran up the valley. Puzzled and bewildered I sat down to reflect. Something was wrong. It was raining hard now and a heavy mist hung like a veil all over the valley, enshrouding the sun, mountains or other landmarks, entirely with its gloom. Deliberating carefully I came to the conclusion that intending to cross that tributary creek, I had got too far down to the fork, which in some places was not much larger than the creek, and mistaking that for the creek, had crossed it and walking up instead of down. I found out my mistake when getting on an overlooking ridge, and weather clearing for a little I discovered the blue smoke from our camp-fire on the opposite side.

Bunch had not returned, so I went to work to get supper, preparing a white moccasin rabbit, the only meat we had, and making bread in the frying-pan from our last flour. When he came in it was snowing furiously, and we had to eat inside the tent.

Our position now became rather serious, and we came to the conclusion to get out of this dangerous encampment the quickest and best way we could before the snow should prohibit it entirely. We went to bed with heavy hearts, but hoping it might clear in the morning. Rising before day we were sadly disappointed; the snow was coming down thick and fast. Having only one alternative, we hurriedly finished breakfast by candle light; then packing and saddling up, we started, going down the extreme lower end of the valley before we took to the precipitous ridges which lead to the summit. Leading one horse, with the other three tailed up behind each other, we began the climb.

Bunch explored ahead to find a passable way, going sometimes through almost impenetrable brush, then up some fearfully steep and now awfully slippery ledges. The snow came down in sheets, darkening all about us and shutting out the view. Bunch, as pathfinder, would often be gone for some time, while I waited with the tired animals for his signal to come on. Thanks to his woodcraft and mountain knowledge, he found our old trail; but we often had to clear patches of snow for signs of our old tracks. At last, after tremendous labor and perseverance, we felt the air getting colder as we neared the summit. One more effort, and we reached the divide with greatly relieved feelings. My flask contained some whisky, which never came more appropriate; it revived our exhausted nerves and put new life into us.

We still had a hard task until we came down to the forks of the river; it was very tiresome traveling in the two or three feet of snow now melting fast; and man and beast rejoiced when at last Boone's cabin came in sight. The kind good-hearted fellow was glad to see us; he had contemplated going out to look after us the next day if we did not come. He quickly had ready a red hot supper. Sunday morning we left our hospitable friend, describing to him as near as possible, where he would find our elk. We made Pinney's for dinner. The old man listening to our accounts, said he and Boone would go after the meat, as soon as the weather allowed it. It was night when we reached Bunch's home.

I remained home the next day, still feeling the effects of the terrible strain of the past days; but Bunch went out to hunt, as there was no meat in the house. The boys and Lee had gone to finish their winter cabin. In the evening they came down with three deer; the senior Mr. Bunch had killed the same number and Bess Bunch, quite a youngster, had killed two, making eight in all for that day. Two days later we made for the boys' cabin, taking along flour and other provisions for their winter use; and putting in the door and window, bunks, finishing with a table and a few benches. They had a very comfortable log cabin.

Hearing one day that elk were plenty on Deadwood Fork, or rather in the "big timbered flats," Charles and I, with a few days' grub, set out. It was a short day's journey from the cabin, and we made a cut across the hills until we got to the regular river trail. Climbing up a steep hill we noticed on the opposite side of the river a band of goats, and prominent among them a tremendous large ram, which would not mix with the rest, but go ahead or else straggle behind; now standing on a commanding rock looking over at us with contempt, he dared and provoked us so much that we concluded to give him a trial. We took the horses near to the river, hoping to find a place possible to ford, but were doomed with disappointment, the river was too deep, swift and dangerous, so we had to give it up. Getting again to our trail, we saw the old patriarch on a high cliff, the wind blowing his venerable long whiskers and with a satirical grin in his face. This incident had considerably delayed us, and we were obliged to camp on Elk Creek.

In the morning we climbed to the summit, and, wending our way down the rocky decline not far from the flats, discovered a band of elk going up a little ridge about a mile away. Waiting until all got over, we hurried down to the flats, unloading the horses, then picking up our rifles we were soon after them. Following in their tracks cautiously to the top, and peeping over, we saw the band not 75yds. away, some lying down and some browsing. At our first fire the two largest rolled over, the rest jumping up, undecided which way to escape. Charles, with his repeater, having the advantage in rapid firing, shot eight times to my five, when we had them down, seven in number, and all cows, yearlings and calves. I felt almost ashamed of our slaughter. It was dark when we had finished dressing and covering them up securely. This wound up my active hunting on the trip, and I had to think of my return.

In the morning we left loaded with some of the meat, Charles going only part of the way, then cutting across to notify the boys to pack in the rest of the elk, while I followed the river trail down to Bunch's cabin.

Thursday I spent mostly in packing my hides, heads and antlers, and had them taken by team to Myers's store in Placerville. Mr. Myers's freight team was going to the railroad, so I availed myself of the offered opportunity to ship all my stuff to Mountain Home. I was obliged to go back to my starting point, Boneparte mine, to get my civilian attire and other things I had left, also to say good-by to Mr. and Mrs. McK. Wednesday, Nov. 10, I had to part from friend Bunch and his kind family. Playing a few parting airs on my flute, at their request, I left this happy family promising soon to come again. Bill remained to go back to the new cabin, to which Charles intended also to return, after seeing me safely back. At Placerville Mr. Myers had kindly attended to my antlers and hides. In the evening I entertained at Mrs. Steckler's hotel the little community with some music, and spent a most happy time.

In the morning we started on our homestretch and camped that night at a deserted cabin. Next day we made Boise City; here I found letters from home, the first since leaving the mine. Sunday we left this beautiful and lively town and got to Slater's ranch on Indian Creek in a severe snowstorm. We slept in the corral with our horses, which we had fed, as there was no pasture. We hoped it would stop in the morning that we might cut across the mountain to Long Tom's, saving thereby fifty miles, but the storm increased so much that we had to go back to the wagon or emigrant road. We came to Hoist's ranch on Cañon Creek, where we partook of Mrs. Hoist's hospitality. Mrs. Hoist's brother went in the morning to Mountain Home, only eleven miles distant. As I did not need any of my hunting or camping

outfit any more he offered to take the things along in his wagon, and we relieved our pack horses almost entirely of their burden, thereby enabling us to travel a great deal faster. That night we made McGinley's store on the foot of Wood Creek, a distance of thirty-five miles, where we made ourselves at home.

Next day I expected to get back to the old mine in good time, but meeting so many friends along the river, it was pretty dark when we got to the Rocky Bar Junction and Charles's cabin.

Charles advised me to stay with him that night and go up to the mine in the morning; but I was too anxious to get back to my old friend McK. I wish I had followed his advice, for the snow lay deep and cold in the dark cañons, the creek was overflowed and frozen, and to complete my misery my saddle horse broke through the ice of the largest stream, was imprisoned perfectly helpless, and obliged me to break an opening for it to get out. Then I had to return for my packhorse, which had bolted. Soaking wet, I was now obliged to walk; the way never before seemed so long and dismal. At last I came to the New Mill, and resting the tired hores a moment for the final steep hill, at last I beheld a light and distinguished the outlining of the buildings of the mine.

McK.'s dog had announced my arrival; Bill, glad to see me back, tended to my horses, while his kind wife was getting dry garments for my stiff, frozen ones. Then I sat down to a nicely prepared suppor, and had quickly forgotten my last sufferings. It was late in the night before turning into my cosy quarters, as I had to give a full account of our eventful trip.

Wednesday I was occupied in packing and arranging my traps to take along on the stage. Next day after dinner I took leave from Mrs. McK. and Howard's folks; friend Bill accompanied me down to Charles's cabin, with whom I spent the last night to be near for the early morning stage. When parting here with Bill McK. who had to go back to the mine, I felt more like going with him back to the old place which had become so dear to me; promising him to come again, he mounted his pony, and was out of sight.

Charles had supper ready, but I did not have any appetite, for I felt as blue as indigo. In the morning we took breakfast at the junction; the stage came rattling along, and thanking Charles, who had become as dear as a brother to me for all his kindness, I took my seat on the box with the driver, and away we went into the crisp cold morning. At passing Willard's I had the chance of saying good-bye to our friend Joe. The stage trip proceeded without any notable event, only it was cutting cold on Camas prairie, and we were glad when the lights of Mountain Home came in sight.

Saturday morning I went over to the station agent and found all my shipped articles in proper condition. Concluding to send all my trophies and camp outfit by freight, I had a large box made resembling Noah's ark. To let the interested reader form his own opinion about the size, I give a summary of the spoils of my hunt, which consisted of one large elk head and antlers, five beautiful blacktail deer heads, eight bear skins, three mountain goats, twenty-four beavers, thirty-five foxes (among which were one handsome "silver" and several beautiful crosses), and divers fishers and martins. Having all securely packed and the box well fastened I stepped on the east bound train, which came steaming along at 11:30 P. M. and reached New York in due season. F. B.

Natural History.

CETACEANS OF THE UNITED STATES.

BY R. W. SHUFELDT, M.A.O.U.

Member of the American Society of Naturalists; Corresponding Member Zoölogical Society of London, etc.

WHALES constitute the marine mammalian fauna of the coasts of our country, and few people, I think, unless they have paid especial attention to the subject, realize how many of them we have, and the numerous species we may lay claim to as properly falling within that category. To continue with our list of animals as published by the U. S. National Museum, we find the following to be the arrangement of this highly interesting group of mammals, viz.:

ORDER CETACEA. CETACEANS.

SUBORDER DENTICETE. TOOTHED WHALES.

Family DELPHINIDÆ. *The Dolphins.*

Sotalia pallida, Gervais. Florida (?).
? Steno fuscus, Gray. Cuba.
Steno compressus, Gray. Gulf of Mexico (?).
Delphinus bairdii, Dall. Baird's Dolphin. Coast of California.
Delphinus delphis, Linné. Common Dolphin. Atlantic Ocean.
Delphinus janira, Gray. The Janira. Newfoundland (Gray).
? Prodelphinus euphrosyne (Gray), True. North Atlantic Ocean.
Leucorhamphus borealis (Peale), Gill. Right-whale Porpoise. Pacific coast of North America.
Lagenorhynchus acutus, Gray. Eschricht's Dolphin. North Atlantic Ocean.
Lagenorhynchus albirostris, Gray. White-beaked Bottlenose. North Atlantic Ocean.
Lagenorhynchus obliquidens, Gill. Striped or Common Dolphin. Pacific coast of the United States.
Lagenorhynchus thicolea, Gray. West coast of North America.
Lagenorhynchus gubenator, Cope. Skunk Porpoise. Coast of New England.
Lagenorhynchus perspicillatus, Cope. Atlantic coast of the United States.
Tursiops tursio (Bonnaterre), Van Ben. & Gervais. Bottle-nosed Dolphin. North Atlantic Ocean.
Tursiops gillii, Dall. Cowfish. Pacific coast of the United States.
Tursiops erebennus, (Cope) Gill. Black Dolphin. Atlantic coast of the United States.
Orca gladiator, (Bonnaterre) Gray. Atlantic Killer. Atlantic Ocean.
Orca atra, Cope. Pacific Killer. Pacific coast of North America.
Orca pacifica, (Gray). North Pacific Ocean. (?)
Globiocephalus melas, (Traill). Blackfish. North Atlantic Ocean.
Globiocephalus brachypterus, Cope. Short-finned Blackfish. Coast of New Jersey.
Globiocephalus scammoni, (Cope). Scammon's Blackfish. Pacific coast of North America and southward.
Grampus griseus, (Cuvier) Gray. Grampus. North Atlantic Ocean.
Grampus stearnsii, Dall. Mottled or White-headed Grampus. Pacific coast of North America.
Delphinapterus catodon, (Linné) Gill. White Whale. Arctic and Subarctic seas.
Monodon monoceros, Linné. Narwhal. Arctic seas.
Phocæna communis, Lesson. Puffing-Pig. Herring-Hog. North Atlantic Ocean.
Phocæna lineata, Cope. Striped Porpoise. Atlantic coast of the United States.
Phocæna vomerina, Gill. California Bay Porpoise. Pacific coast of the United State.

Family ZIPHIIDÆ. *Bottle-nose Whales.*

Berardius bairdii, Stejneger. Baird's Whale. Bering Island.
Hyperoödon rostratus, (Chemnitz) Wesmael. Bottle-nose Whale. North Atlantic Ocean.
Ziphius cavirostris, Cuvier. Temperate and tropical seas.
? Ziphius semijunctus, (Cope). Atlantic Ocean.
Ziphius grebnitzkii, Stejneger. Grebnitzky's Bottle-nose Whale. Bering Island.
Mesoplodon sowerbiensis, Gervais. Sowerby's Whale. Temperate North Atlantic.

Family PHYSETERIDÆ. *The Sperm Whales.*

Physeter macrocephalus, Linné. Sperm Whale. Temperate and tropical seas.
Kogia breviceps, (De Blainville) Gray. Pygmy Sperm Whale. Temperate and tropical seas.

SUBORDER MYSTICETE. WHALEBONE WHALES.

Family BALÆNIDÆ.

Rhachianectes glaucus, Cope. Devil-fish. Gray Whale. Pacific coast of North America.
Agaphelus gibbosus, Cope. (?) Scragg Whale. North Atlantic.
Megaptera longimana, (Rud.) Gray. Humpback Whale. North Atlantic Ocean.
Megaptera beliceosa, Cope. Carribbean Humpback Whale. Carribbean Sea.
Megaptera versabilis, Cope. Humpback Whale. North Pacific Ocean.
Physalus antiquorum, (Fischer) Gray. Finback Whale; Razor-back. North Atlantic Ocean.
Physalus sibbaldii, Gray. North Atlantic Ocean.
Balænoptera rostratus, (Muller) Gray. Piked Whale (?Grampus of New England fishermen). North Atlantic Ocean.
Balænoptera davidsoni, Scammon. Finback Whale. Northeastern Pacific Ocean.
Sibbaldius laticeps, Gray. Rudolphi's Rorqual. North Atlantic Ocean.
Sibbaldius tuberosus, Cope. Mobjack Bay, Virginia.
Sibbaldius veliferus, (Cope). Finback Whale. Pacific coast of North America.
Sibbaldius tectirostris, Cope. Coast of Maryland.
Sibbaldius sulfureus, Cope. Sulphur-bottom Whale. Pacific coast of North America.
Balæna japonica, Gray. Right Whale of North Pacific. North Pacific Ocean.
Balæna biscayensis, Gray. Black Whale; Right Whale of the North Atlantic. Temperate North Atlantic.
Balæna mysticetus, Linné. Bowhead Whale. Arctic Seas.

It will be observed of the species enumerated in this formidable list, that the vast majority of them actually occur upon our own coasts, so that in a paper of a length that the present must of necessity be, it will simply be out of the question for me to give even the briefest history of the several types, as much as I would like to do so, as the limitations of space would be greatly exceeded, and even, perhaps, the main object of my contribution in the present instance, somewhat interferred with, not to say, defeated.

In the group of Cetaceans which I have chosen to illustrate this article, those United States types have been designedly selected by me which I deemed would best convey to the general reader an idea of the various forms assumed by the species representing this Order; and in the text it will be my aim to present in a general way the habits common to the group, and as far as possible, the charactertistics of the several genera.

So far as the fruits of Geology have to this time been enabled to indicate it for us, we are obliged to confess that the ancestry of the Cetaceans in time is still involved in much obscurity. Huge, serpent-like Whales (*Zeuglodon*) have been found in a fossil state in certain parts of Alabama, which have thrown some light on this perplexing subject, and in other parts of the world fossil forms have been discovered which have helped us to a better solution, but, as I say, we are still a long ways from being in possession of an exact knowledge of the origin of this group, as we are in the case of many other animals. One thing, however, must be borne fully in mind, and that is, the Whales are just as truly mammalian in all respects, as are such animals as seals, pigs, or bears. Indeed, they are nothing more nor less than monster marine mammals that have become specially modified in time to lead strictly an aquatic life in recent epochs.

The general external characters of Whales can be readily appreciated from the several drawings of the species accompanying this paper; the fish-like form is to be noted, with the enormous head in some of the species, and with the total absence of anything like unto a neck in all the forms; the peculiar pattern of the horizontally placed tail with its diverging, lateral "flukes," posteriorly divided by the median notch; the form of the anterior paddles, and the entire absence of a hinder pair; that a few of the species may have a showing of scattered hairs on the body, more especially near the mouth; the small eyes, the simple aperture of the ears, the valvular openings of the nostrils situated on top of the head; and a number of other points. Whales also possess immediately beneath the skin a thick layer of fat known as the "blubber," from which the oil is manufactured, and for which men hunt and capture them. As in the case of the topographical anatomy, the internal structure of these ponderous creatures is highly interesting and instructive, but our space will admit of none of it here. But it will be proper to note, however, that all Whales have teeth, with but few exceptions, and that these vary greatly in number; never being preceded by a milk set, while in the adult right whales, in which family the teeth are absent, the well-known whalebone is seen (baleen). It would be as well to remark, too, that the mammæ in the female Whales are situated on either side of the genital fissure, being two in number, and each being under the control of a special compressor muscle by means of which the milk of the mother can be injected into the mouth of her young one (there being rarely two), and the latter is thus enabled to nurse under water.

Whales of all species subsist on animal food of some kind or other, such as for example, fish, squids, crustaceans, and the medusæ. The killers (*Orca*) alone prey upon the species of their own Order, and upon such other warm-blooded animals as seals and their kind.

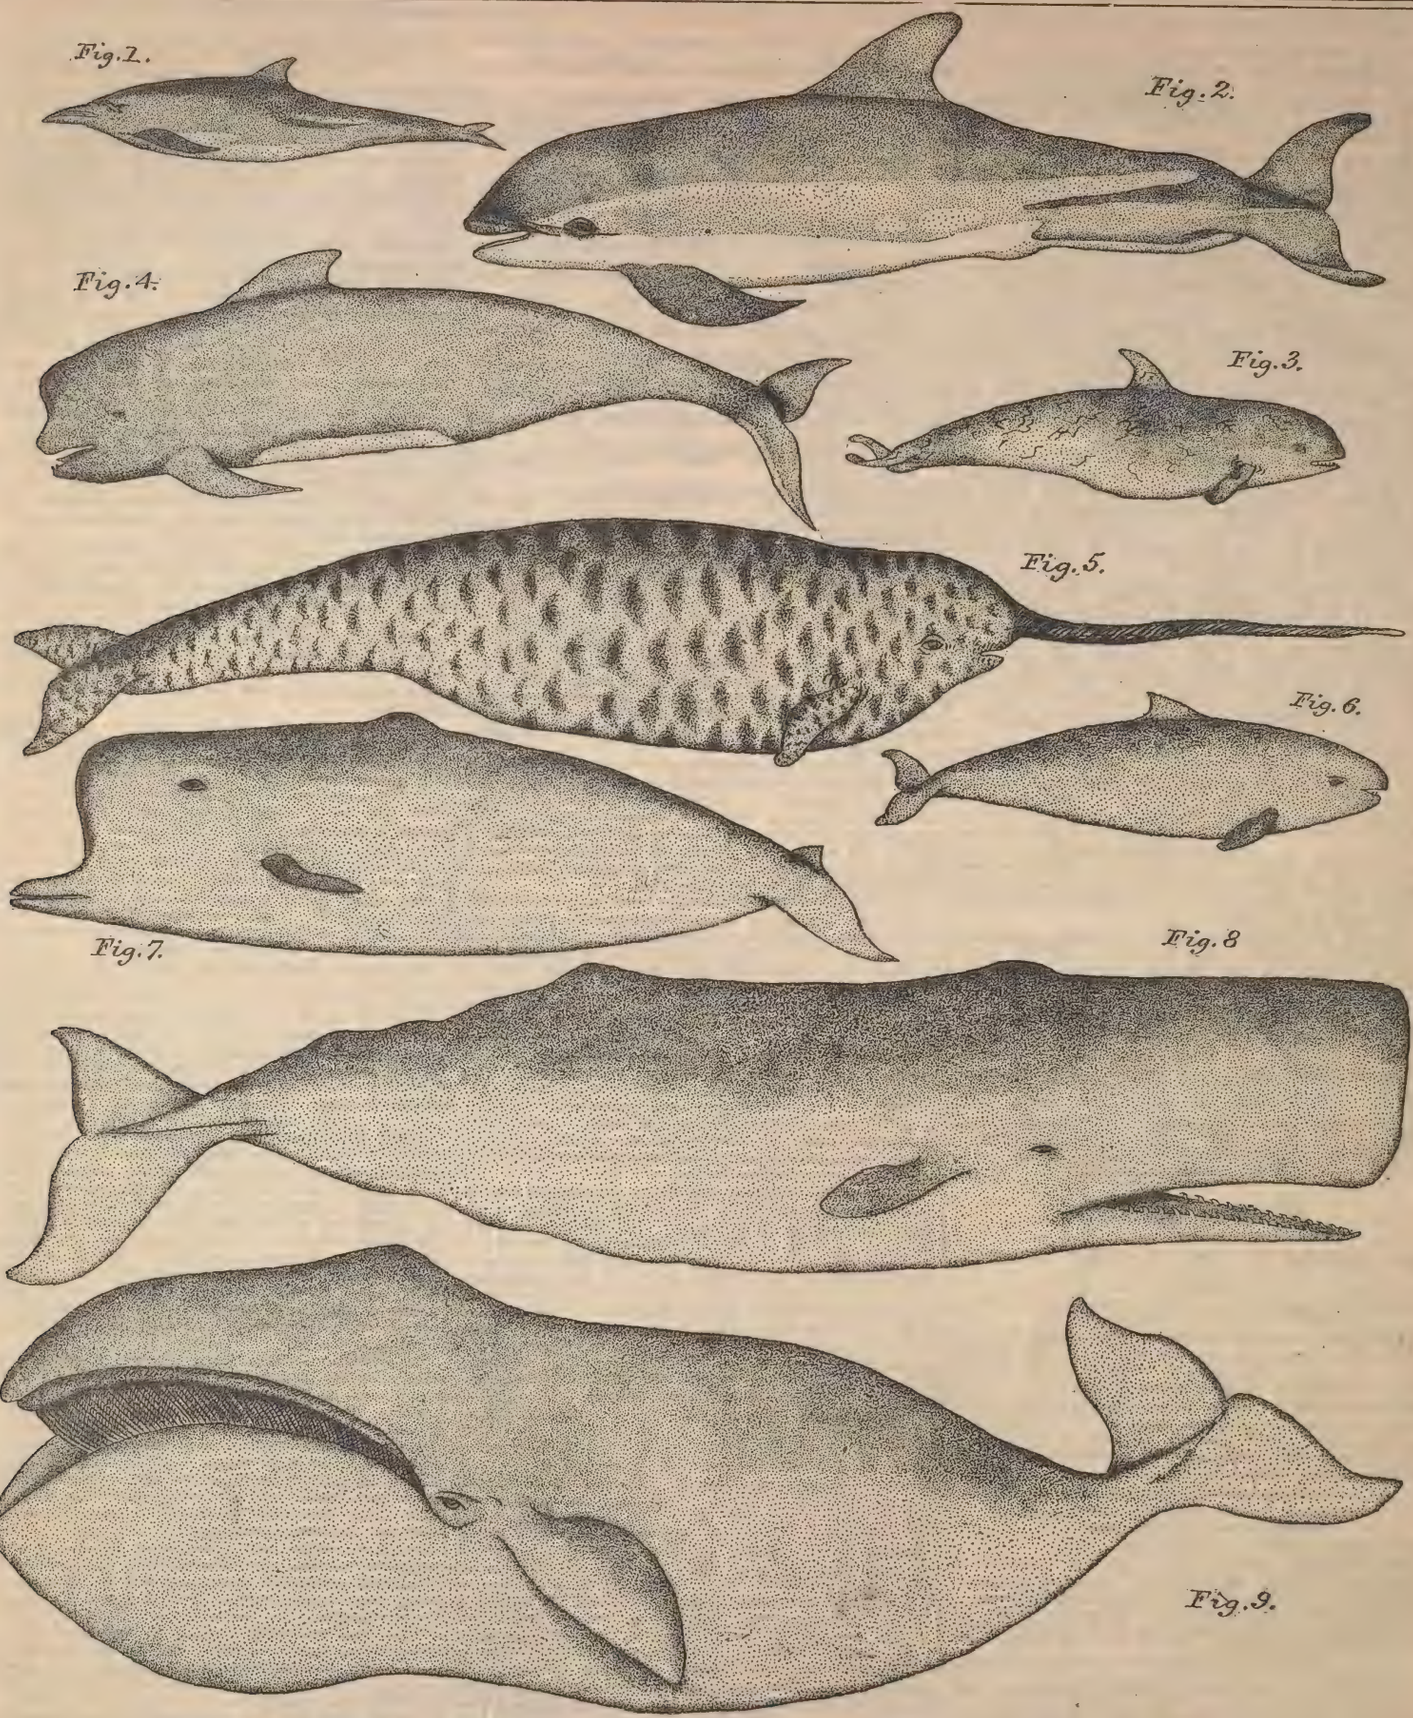
During a year that I spent at sea in the Gulf of Mexico and the South Atlantic, I had many opportunities to observe the various kinds of whales and porpoises, which I availed myself of to the fullest extent, and have seen an old Sperm whale blow many and many a time. Professor Flower well describes this act, and according to this eminent authority, when speaking of what a helpless creature a whale is on shore, he says that when in their element, the sea, "they have, however, to rise very frequently to the surface for the purpose of respiration; and, in relation to the constant upward and downward movement in the water thus necessitated, their principal instrument of motion, the tail, is expanded horizontally, quite unlike that of a fish, whose movements are mainly in straightforward or lateral directions. The position of the respiratory orifice or nostril on the highest part of the head is very important for this mode of life, as it is the only part of the body the exposure of which above the surface is absolutely necessary. Of the numerous erroneous ideas connected with natural history, few are so widespread and still so firmly believed, notwithstanding repeated expositions of its falsity, as that the *Cetacea* spout out through their blowholes water taken in at the mouth. The fact is, the 'spouting,' or more properly 'blowing,' of the Whale is nothing more than the ordinary act of expiration, which, taking place at longer intervals than in-land animals, is performed with a greater amount of emphasis. The moment the animal rises to the surface it forcibly expels from its lungs the air taken in at the last inspiration, which, of course, is highly charged with watery vapor in consequence of the natural respiratory changes. This, rapidly condensing in the cold atmosphere in which the phenomenon is generally observed, forms a column of steam or spray, which has been erroneously taken for water. It also often happens, especially when the surface of the ocean is agitated into waves, that the animal commences its expiratory puff before the orifice has quite cleared the top of the water, some of which may thus be driven upward with the blast, tending to complete the illusion. In hunting Whales the harpoon often pierces the lungs or air passages of the unfortunate victim, and then fountains of blood may be forced high in the air through the blowholes, as commonly depicted in scenes of arctic adventure; but this is nothing more (allowance being made for the Whale's peculiar mode of breathing) than what always follows severe wounds of the respiratory organs of other animals."

The refined oil known as "spermaceti" is manufactured from that oil which is found in the great cavity above the skull in the Sperm Whale, while "ambergris," so extensively used by perfumers in their art, is found in the intestines of the same animal, and sometimes floating on the surface of the seas they inhabit.

By the aid of modern appliances, the chase and capture of these huge mammals has within recent times been reduced almost to a science, but an account of such matters would, in the opinion of the writer, be out of place in the present connection, dealing as we are more particularly with the life histories of these Cetaceans; it will be as well to add, however, that their constant pursuit and destruction by man must in due time tell markedly on their numbers, if it does not lead to their actual extermination.

Glancing again at our List above we find that these Cetaceans are primarily divided into Families of TOOTHED WHALES, BOTTLE-NOSE WHALES, SPERM WHALES and WHALEBONE WHALES. Among the first of these we find the Common Dolphin (*D. delphis*), and who that has ever been out for an ocean voyage over the seas that he inhabits, does not know him. Suddenly a "school" of them will appear under the very bows of your vessel, plunging in and out of the water in graceful curves, and in a manner most fascinating to the observer, who never wearies of the sight. Their powerful, tooth-armed beaks are the very terror of the small fishes upon which they habitually prey, and it is an extraordinary thing to see the agility with which they effect such captures.

Captain Scammon speaking of the Common Porpoise of the Pacific coast, says, "They are seen in numbers varying from a dozen up to many hundreds tumbling over the surface of the sea, or making arching leaps, plunging again on the same curve, or darting high and falling diagonally sidewise upon the water with a spiteful splash, accompanied by a report which may be heard at some distance. In calm weather they are seen in numerous shoals, leaping, plunging, lobtailing and finning, while the assemblage moves swiftly in various directions. They abound more along the coasts where small fish are found. Occasionally a large number of them will get into a school of fish, frightening them so much that they lose nearly all control of their movements, while the Porpoises fill themselves to repletion." This species is the *L. obliquidens* of our List. On our New England coast the best known form is the "Skunk Porpoise," shown in Fig. 2 of the present paper, and its habits are fully as interesting as those of the Dolphin of which we have just been speaking. Even at the present time, it is by no means a rare thing to discover a new species of this group, and undoubtedly there still remain a number of forms as yet unknown to science.



The Orcas or Killer Whales constitute another genus of this family, and they are only too well known to the whalemen as the veriest wolves of the high seas, often robbing them of their hard-earned spoils. They are possessed of enormous strength and speed, and even at a distance at sea they can be easily recognized by their lofty dorsal fins, an appendage which, in the High-finned Killer, attains to the enormous height of six feet. These merciless animals will ravenously attack and kill the biggest whale that ever plowed the ocean, and devour the carcass afterward, piecemeal; they are also very destructive of the seals about the islands inhabited by those valuable animals, and according to Professor Goode, Eschricht says that thirteen porpoises and fourteen seals were found in the stomach of an Atlantic Killer, sixteen feet in length.

The Blackfishes (Fig. 4) are a medium-sized whale that range over their oceanic habitat in schools sometimes numbering several hundreds; they are not especially valuable to the whalers, but are mercilessly preyed upon by the Killer Whales.

Rarer than the last mentioned species, though often associated with them, are the Grampuses (Fig. 3), a smaller whale than they, though with very similar habits, and we are told that they make their appearance in our waters only about once in ten years. Professor Flower has proved beyond all manner of doubt that the fantastic markings on the body of this animal are normal and are not due to scars from conflicts with their fellows or other species. A fine cast of a Grampus may be seen and studied at the Smithsonian Institution, where it used to surmount the doorway of the main entrance, down-stairs.

One of the most interesting of all Cetaceans is the Narwhal (Fig. 5), an animal which stands responsible for the Unicorn of fancy, and which is now restricted in its range to the northern shores of our Alaskan territories. The spiral tusk growing from the left side of its upper jaw is a modified tooth which may attain a length of eight or ten feet. It is absent in the female, the sex being practically toothless, or at least the teeth are concealed in the jaw as is the case on the right side in the male Narwhal. This tusk is without enamel, and a single one is valued at $50.00, the ivory being put to a variety of purposes. Occasionally both tusks are developed, in which case the spirals each turn the same way, or the twist has the same direction. Narwhals feed upon small fish and crustaceans.

Herring Hogs (*Phocæna*), are representatives of another very interesting genus (Fig. 6); these animals are also known as the harbor porpoises or "puffing pigs," they

REPRESENTATIVE SPECIES OF UNITED STATES CETACEANS.—Copied by the Author.

Fig. 1.—Common Dolphin (*Delphinus delphis*). After Flower. Length of adult 10ft.

Fig. 2.—Skunk Porpoise (*Lagenorhynchus gubernator*). From Goode, after Cope. Length of adult about 10ft.

Fig. 3.—The Grampus (*Grampus griseus*). After Elliott. Length of adult 20ft.

Fig. 4.—The Blackfish (*Globiocephalus melas*). From Goode, after Trans. Zoöl. Soc. of Lond., Vol. 8, Pl. 60. Length of adult 18 to 25ft.

Fig. 5.—The Narwhal (*Monodon monoceros*). After Elliott. Length of adult 10 to 14ft.

Fig. 6.—The "Herring-Hog" *Phocœna communis*). From a photograph by the U. S. Fish Commission. Length of adult rather more than 4ft.

Fig. 7.—The Sperm Whale Porpoise (*Hyperoödon bidens*). After Blake. Length of adult 25ft.

Fig. 8.—The Sperm Whale (*Physeter macrocephalus*). From Goode, after Scammon. Length of adult male 84ft.

Fig. 9.—The Bowhead Whale (*Balæna mysticetus*). From Goode, after Scammon. Length of adult male 47ft.

have earned this last name from their habit of puffing and grunting as they disport themselves in the surf or as they roll in the breakers at the mouths of harbors and rivers. These Herring Hogs are very destructive of several species of the small edible fish, and of oysters, but they in turn are often attacked and killed by the Porpoises.

To represent the next Family, the Bottle-nose Whales, I have given a figure of *Hyperoödon bidens*, but very little is known of these forms and the nomenclature of the group is not in a very satisfactory condition.

Passing next to the Family of the true Sperm Whales (*Physeteridæ*), we find them represented by the Giant Sperm and the Pigmy Sperm Whales.

The Sperm Whale or Cachalot (*P. macrocephalus*) is a very well-known Cetacean, one of wide distribution and of great commercial importance (Fig. 8). In this species the male may attain the enormous length of 84ft., whereas the females are not more than one-third as large, and are slenderer. In color these animals are of a blackish brown above, paler on their sides, and grayish on the under parts; very old ones are gray on top of the head and about the nostrils. They feed on small fish principally, and squids; it is related that several hundred mackerel have been taken from the stomach of a third grown one. All times of the year is the breeding season for them, and one at a birth is the rule, never more than two. The female nurses her young by reclining quietly on her side, as she floats passively on the surface of the ocean. The period of gestation is said to be ten months.

Its actions and habits under various circumstances are familiar to the most of us, and have been well described by Scammon; the "blowing" of this whale, and the useful products it yields, I have already alluded to above.

Turning to the Suborder Mysticete of our List, we find a splendid array of species representing the animals known as the Whalebone Whales, all of which are creatures of great size, and valuable for the products they yield to men. Of no little importance among these is the whalebone of commerce, but this is principally obtained from the Bowhead Whale (Fig. 9) of the Polar Seas. The habits of the Bowhead partake of the habits of whales generally, with a number of very interesting ones peculiarly its own. Professor Goode remarks that "The food of the Bowhead consists of floating animals, classed by the whalemen under the names 'right whale feed' and 'brit.' Many kinds of invertebrates are, of course, included under these general terms, one of the most abundant of which is, perhaps, a kind of winged or pteropod mollusk, the *Clio borealis*, which occurs in the northern seas, floating in great masses. When the Bowhead is feeding it moves with considerable velocity near the surface, its jaws being open to allow the passage of currents of water into the cavity of the mouth and through the

layers of baleen at the sides. All eatable substances are strained out by the fringes of the baleen and are swallowed." Much more could be said about these whalebone whales, but I find my space already nearly exhausted, and I still have a few concluding remarks to make of no little importance.

My studies of the Cetaceans and my reading about them have both convinced me that the Order has by no means received the attention at the hands of descriptive zoölogists and anatomists that it so justly deserves. This neglect can be atoned for in many ways, and more especially by such persons as reside the year round either upon the Atlantic or Pacific seaboards, or by capable observers who lead a seafaring life. Lighthouse keepers and whalemen both have excellent opportunities to thus powerfully aid science in such work. Whalemen should be encouraged by some means to systematically capture specimens of the smaller Cetaceans when the opportunity is afforded them, and from these to take accurate measurements of the specimens at the time of capture. Skeletons could also be made, and viscera placed in crude spirits, both being brought home and turned over to the proper authorities for description. And, when it so happens that somebody chances to be on board who can make a serviceable sketch of the animal, this essential aid should never be overlooked; the habits of whales in their normal habitat should also be constantly recorded, and particularly as soon after the observation as possible. Lighthouse keepers and other seashore observers can effect all this, and much more besides, for where any of the whale tribe are driven ashore in their vicinity, they can, in addition to what is suggested above, often be enabled to take a good series of photographs of the specimen, as well as a very complete set of measurements. When within a reasonable distance of Washington, they can, too, immediately send a telegram to Mr. F. W. True, Curator of the Department of Mammals, U. S. National Museum, that such and such suspicious looking specimens have gone ashore at such and such a point, thus giving the proper authorities the opportunity to dispatch a responsible person to the spot should they desire to do so. There are undoubtedly a number of the smaller species of Cetaceans in our waters as yet undescribed.

Those of my readers desiring to further inform themselves upon the subject which of necessity I have been compelled to deal with so briefly in this contribution, can do no better than consult some of the following works:

Bibliography of Cetacea: D. F. Eschricht, "Untersuchungen über die Nordischen Wallthiere," 1849. "Ostéographie des Cétacés," by P. J. Van Beneden and P. Gervais, 1868-79. C. M. Scammon, "Marine Mammals of the N. W. Coast of North America," 1874. For the structure of whalebone, see Hunter, "Observations on the Structure and Economy of Whales," Phil. Trans., 1787; Eschricht and Reinhardt, "On the Greenland Right Whale," English translation by the Ray Society, 1866, pp. 67-78; and Sir W. Turner, in Trans. Roy. Soc. Game Bag and Gun.

HUNTING THE ELK.

BY the older writers the elk was called the wapiti or wapiti deer, this being the Iroquois name for the animal. The term is employed now only in books and by Europeans. The elk of Europe is almost identical with our moose, which name is derived from a Cree Indian word, *moosŏă*. It is unfortunate that two such magnificent animals, inhabiting different continents, should bear the same English name, but the appellation elk is now so firmly settled in America as belonging to *Cervus canadensis*, that it can never be changed.

The young elk are born in May or June and, like young deer of most species, are at first spotted. The coat is bright bay, like that of the Virginia deer, but the spots are neither so numerous, so regular, nor so well defined. At the first shedding of the pelage, which takes place in September, the spots are lost and the animals assume the yellowish gray which is their winter coloring. The calves are usually born in pairs, male and female, and during the summer the mother and her young keep by themselves. In the early part of August they begin to collect in scattered companies, and early in September the rutting season begins.

Meanwhile, the bulls have been keeping apart. Late in the winter, their superb horns dropped off, and in the early spring the new antlers began to appear, through the summer they have been increasing in size and by the middle of August have reached their full development. They are still covered with the "velvet," however, and although they have ceased growing and are quite hard, the tender skin, beneath which the warm blood still courses, clings to them for a little while longer. At this time the elk are found in bands, more or less numerous, according as the country which they inhabit is much hunted or not. The time for freeing the horns from the velvet varies somewhat.

Most of the bulls begin to "shake," as the mountain men term it, about the first of September. The older ones are usually the first to set about this, and some of the yearlings carry the velvet until the late fall. Soon after the horns are fully grown and hard, the flow of blood through the arteries which supply the horns and the velvet, is checked, and the skin begins to itch. The bull now rubs his horns furiously against bushes and trees, and the velvet is torn off and hangs from the horns and about his ears in bleeding strips. Usually he seeks some low stiff-branched shrub, like the willows in a stream bottom, or a young pine on the mountainside, and thrusting his head among the branches, moves it vigorously up and down and from side to side. This, of course, causes the bush to wave to and fro, and it is from this movement that the term "shaking" is derived.

It is just at and immediately before this time that the bull elk are in their very best condition. They are now enormously fat, and the flesh is delicious, though elk meat, like that of most other animals, should always be kept a few days before eaten. Immediately after being killed it is a little coarse, and in the bulls sometimes tough, but, after hanging four or five days, it becomes tender and very palatable. It has a flavor of its own, which is not found in any other wild meat with which I am acquainted, except in a less degree in that of the mule deer, and is moreover extremely rich and nutritious.

During the time that the bulls are "shaking" they are very easily approached, for with their heads hidden in the brush they can neither see nor hear, and the hunter, provided he has the wind in his favor, finds little difficulty in creeping within rifle range. This is more true on the plains and in an open country than in the mountains. There the elk is as likely to do his shaking in the midst of a dense forest as anywhere else, and in such situations he is not easily discovered until one is quite close to him.

As soon as his horns are free from the velvet, and are hard and polished, the bull elk begins to gather about him all the cows he can. He searches for them in the thickets, along the streams, in the ravines and among the timber, and this search is conducted in a very systematic manner. A year ago last fall, while hunting in Wyoming Territory, I witnessed very satisfactorily the method in which they operate. I was out on foot four or five miles from the camp, and was sitting on a high mesa scanning the surrounding country with my field glass, when I saw a fine bull elk emerge from a ravine, which ran up into the plateau on which I was, walk along over the plain below to the next ravine, enter that and presently come out at its head on to the mesa, and then walk to the head of the next ravine and proceed down that. When he reached the plain he again kept along the foot of the hills until he reached the mouth of another ravine, and then he came up that. In this way he proceeded, systematically searching through these hiding places for any cows that might be lurking there. As the cows have now come together, a bull that finds one is likely to get a dozen or perhaps fifty at the same time. The particular bull mentioned was, when first seen, perhaps a mile from me, but he traveled so briskly that I tried in vain to get within shooting distance. Although he covered more than twice the distance I had to go, he kept far ahead of me, and finally, having followed the edge of the mesa down to where it sloped off into the plain, and the ravines ended, he turned briskly to the right, crossed a broad valley where some cattle were feeding, and disappeared in a narrow mountain valley which ran into the hills two or three miles from the camp.

The next day, however, I had the pleasure of seeing him, in fact, of making his intimate acquaintance. There were three of us in the camp, and all the fresh meat that there was under the wagon was one antelope ham. We had been hard at work for several days sinking a prospect hole in the hillside, high above the camp, and we all of us felt like taking a day for rest. So we started out after breakfast, and went back into the hills to try and get some blacktail. We only saw four, one of them a doe, which walked out on to the hillside within seventy-five steps of us, and which we could easily have killed. But there were three bucks following her, and as the bucks are so much fatter in September than the does, we let her go, hoping that the bucks would come out of the green timber, so that we could see them distinctly enough to shoot. Instead of doing that they kept under cover until they had passed us, and then one of them must have caught our wind, for on a sudden they all stampeded, and we saw no more of them. The rest of our hunt was fruitless, and about three o'clock we started down the valley, which was the same one the bull elk had entered the day before, and followed it down, intending, when we came to a point opposite the camp, to cross the low spur of the hills just below where the mine was. I was riding ahead, Bill next, and Ike bringing up the rear. Suddenly I heard Bill call to me in a low voice, and knowing from his tone that he saw game, I had slipped off my horse and thrown a cartridge into my rifle, before I looked at him. Then following the direction of his rifle barrel, I saw in the bed of the stream among the willows about 200yds. away, the heads and bodies of a dozen cow elk walking up out of the creek.

The shots flew pretty fast for a few seconds. The band, which numbered about forty in all, did not wait to investigate the noise, but dashed out of the stream bed. It was a bad place for them, however. Before they could cross the ridge they had at least 600yds. of steep open ground to cover and all this time they were exposed to our rifles. The last elk to emerge from the willows was the bull, who had stayed behind to hurry up the laggard cows and who now brought up the rear of the fleeing band. Before they had got in motion a calf had fallen, and ere they had gone 50yds. two cows dropped. We had more than meat enough and I shouted at my companions, "Fire at the bull." He was now between 300 and 400yds. distant, but on the smooth slope over which he was passing it was easy to gauge the elevation. My first ball struck a little under him, the next just beyond, and at the third carefully aimed shot I saw him flinch, bend down, and then suddenly turn at right angles to the course he had been pursuing. I gave a little cheer of triumph, for as he was running I felt sure that the ball, if it had hit his body at all, had made a fatal wound. And so it was. After going 100yds. further he slackened his trot and began to walk with his head down, and presently he laid down beneath a solitary pine tree that stood near the top of the slope. We mounted our horses and rode down the hill, across the stream and up to where the elk lay. Near the cows we left the ponies standing and walked up the steep ascent to where the bull was. As we approached him we could see the great antlers tossing in the death agony, but when we reached him the struggle was over and the monarch of the forest was dead.

I had longed to possess that great head when I had first seen it, and had felt a savage satisfaction as I saw the lead strike the bull, for I remembered the exhausting labor that I had undergone on the previous day in my efforts to come up with him. But now, as I stood over him on the mountainside, and beheld his beauty and his strength and his symmetry, I wished that we had not killed him. It seemed a cruel wrong to take so grand a life, except in case of absolute necessity. I suppose that every man who has killed much large game often has these remorseful moments, but usually the feeling that he experiences is nothing more than remorse, and does not reach the height of penitence. So the next time he goes hunting he tries with all his might to do exactly the thing which he had previously regretted doing. Some of us there are—old hunters—who have reached a point where we try to kill only enough for our requirements. One deer or antelope or elk a week is enough for a party of two or three when traveling through the wilds, but it is difficult—almost impossible—if you have young and ardent hunters with you, to keep them down to anything like this limit. I have traveled for weeks through the mountains where, without hunting, a dozen shots might be had each day at antelope, elk and deer, and have only fired two or three shots a week, killing meat only when it was absolutely required for the camp, but I can remember well enough that years ago, when I was new to the mountains, I used to shoot at pretty nearly everything that I could see.

When a bull elk has got together a band of cows he guards them jealously. The younger bulls, which have not been able to accumulate any wives, often loiter about the harem of their more successful brothers, and try to steal away some of the cows. The old bull is kept pretty busy during the season of the rut, chasing away intruders and keeping his cows together. He treats the latter with scant courtesy, and does not hesitate to prod them viciously with his horns if they are slow in moving in the direction in which he desires them to go. If an alarm takes place he rushes about, starting each one of the band in flight, and not until all are in motion does he himself take to his heels. Even then he always brings up the rear, threatening the last animals with his great antlers and urging them to greater speed.

Just before the rut begins, the bull, as has been said, is enormously fat and at his best. But now he begins to get out of condition. His neck swells, his fat turns yellow, and he has a strong and disagreeable odor. Moreover his arduous labors soon cause him to lose flesh, and, by the time the season is at an end, he is gaunt and poor. It does not take him long to pick up again, however, and often by the middle of the winter the bulls are again in fair order, though by no means as fat as the cows.

Down on the plains in years gone by I have had many a good run after elk, on horseback. This is a delightful method of pursuing them, but a fast, quick horse is needed for success. Speed is required to overtake the game, and quickness to avoid the obstacles met with in the very rough ground where the chase must often be made. The natural gait of the elk is a trot, and it takes a very good horse to overtake him while in this gait. He can keep this trot for hours if not for a whole day, and the amount of ground that he can cover at this pace, without tiring, is astonishing. He also runs, but his run, while faster than the trot, is also more exhausting, and, therefore, the man who is running elk always tries to push them as hard as possible at first, so as to make them break their trot, in which case he will be likely, if his horse is a good one, to overtake the fattest of the band. In a country where the going is good it is by no means difficult to run elk in this way, when the sport becomes very much like buffalo running, but in a rough or mountainous region, there is little opportunity for a chase of this kind. When alarmed they always make for the roughest ground, choosing rocky hillsides, ground covered with fallen timber, or the densest forests. I have seen a band slide, roll and tumble down an almost vertical precipice, where it would be utterly impossible for a rider to follow at all, or trot smoothly and easily along a steep mountainside, rough with huge blocks of stone, among which a horse would have broken his neck or legs at almost every stride.

It is very exciting sport to get a band of elk on just the right ground, and with a horse in which you have confidence, dash out from behind some hill, and, almost before they have taken the alarm, find yourself close to the outskirts of the band. They get together hastily and start off, at first in a close bunch, then gradually stringing out in a long line, the cows and calves ahead, the bulls bringing up the rear. If you are chasing them just for the ride, and without the desire to kill, perhaps you will pass the last of the herd, and as you do so, they will turn off, and running a few hundred yards to one side or the other, will stop and stare at you for a few moments, and then throwing back their horns over their hips will trot off over the hills, and out of sight. I have a hunting mare, a swift, beautiful animal, which is very fond of this sport, and has more than once carried me into the very midst of a band of elk. G.

ADIRONDACK DEER.

KEENE VALLEY, N. Y., Oct. 16.—*Editor Forest and Stream:* Perhaps you would like a report of the deer shooting in this section this season. Fewer deer have been killed here than in any year in my remembrance; and the advocates of hounding, who insisted last year that the deer were more plenty than ever, this season admitted that there was little use in hunting here. The Au Sable Lakes are closed to them, from the fact that they are included in the tract recently bought by a number of gentlemen, who forbid all hunting and fishing on it for a time: and the fact that their orders are obeyed by the men who have hunted there all their lives, shows, to my mind, how easy it would be for the State to enforce its laws for the protection of game if this was seriously attempted.

Some half dozen deer have been killed up John's Brook, a stream that rises on the northern slopes of Mt. Marcy and empties into the Au Sable River at this place. They were driven by dogs and shot on runways. The same men have brought in deer from other localities, and without doubt have exceeded the limit of three to one hunter. Quite a party went from here to Catlin Lake, in the town of Newcomb, and returned with two bucks and three does. They were enthusiastic in their praise of that section for hunting, saying that they had to keep the dogs tied till they got a mile or so from the lake, as they could "jump them up" at any point near the shores. There had been no hounding done there to amount to anything; the deer were so plenty and so tame that they could be killed at any time by still-hunting in summer. Yet that is the home of a family of noted still-hunters, beginning with old John Cheeny, ending with his descendants of the third generation. His nephews, Caleb and John Chase, are quite as skillful as Cheeny was in his best days. If it is the still-hunters that exterminate the deer, and the hounds that save them from the panthers and all other dangers, how is it that they are yet so plenty there, in a still-hunting district, while in this place, where ten or fifteen years ago the deer were more plenty and where hounding is the rule, they are now too few to pay to hunt? I think there is here a conundrum for Dr. Ward to "put in his pipe and smoke." The one good thing about this hunt was, that the party left five hounds there. They said there was no use in wintering them here. If the still-hunters of that section will think the same, and put them out of existence, the hunt will prove to have been a very successful one. AU SABLE.

SHOOTING NOTES.

ALL sorts of reports have been coming in about the woodcock shooting during the past week. That there are plenty of birds somewhere is attested by a stroll through the New York markets. Mr. Robins, one of the oldest and most reliable game dealers, whose stand is in Fulton Market, tells me the majority of the birds come from Connecticut. The observance of a close summer season is no doubt responsible for the excellence of the shooting now to be had in many sections of the Wooden Nutmeg State.

Mr. Harry Leavitt, of Wall street, who is about as good a game shot as the East can produce, had a couple of days' shooting last week near Great Barrington. He bagged about a couple of dozen cock and a nice bunch of partridges. If what the farmers say is true, Mr. Leavitt never misses. I have not seen Mr. Leavitt in the field for several years, but when I did he was a past master in the art of bringing birds down. Once I saw him make some very clever kills in the mountains of northern New Jersey that convinced me that he had trained in a good school and knew how to handle his birds in dense cover remarkably well.

Mr. Frank Cummins, of this city, has been picking up some birds this autumn. One day last week he shot fourteen cock near Croton Lake. Mr. Cummins is a great enthusiast, and shoots this winter in Florida.

Mr. Gilbert Speir and Mr. Gus Walters, both of this city, shot one day last week near Ramapo, on the Erie Railway. They got seven cock and one of Tuxedo Park's English pheasants. Mr. Speir is another first-class shot. He will shoot ducks at Havre de Grace on the opening day.

The glory of the once famous Wallkill region seems to have departed. Although the ground both in the swamps along the alder-arched streams is in prime condition, and the mountain swales shaded by chestnut sprouts and white birch are in order to receive the birds, woodcock were never so scarce as they were last week. A friend of mine who knows every hole and corner in this section took in the whole country and saw but two birds. I nearly experienced the same ill luck in the Pequest lowlands. There the clearing off of the timber and a great forest fire has destroyed the best of the unpreserved woodcock cover. The ground was too dry prior to the rains last week. From the old markings it was evident that there had been some birds about the time of the frosts a week before, but they had evidently gone on their way rejoicing. Mr. F. Satterthwaite, of Newark, was up there at the same time, shooting on his preserve. He was out two mornings and only got eleven woodcock. Of these only one was a hen bird. He said he found every one of them in the spice bushes along the banks of the creek, and not on the outside edges as formerly. There are quite a number of much-shot-at partridges in Warren county. They have about cleaned up the wild grapes in the swamps and have adjourned to the mountains to await the opening of the season. Quail are in fair abundance, but many of the bevies are of small birds unfit to shoot for several weeks to come. But what between posted lands, irate farmers and bull-brier thickets, the quail have got the budge on both local and city gunners.

In Sussex county, N. J., quail and woodcock are scarce as compared with former years. Mr. Theo. Morford, of Newton, tells me that, in fact, there are very few quail. Mr. Morford no longer fruitlessly walks his legs off in his own State in search of sport, but goes to Tennessee next month where it is assured. There he has a host of warm friends, and with good dogs enjoys a blissful holiday.

More encouraging reports come from central and southern New Jersey. Harry Height—the veteran Hart Height's hopeful—says a good shot can average about a dozen birds early in the season in the southern part of Monmouth county. Quail about Allair are only in fair numbers. Mr. R. von Ohl, of Jobstown, N. J., however, informs me that there are more quail in Burlington county than he has seen for the past three years. He says they are very small, however, and that on Monday last he started some that could scarcely fly. As compared with last season the crop is better this year.

Glancing westward we find that the members of the great ducking clubs near Toledo and on the St. Clair Flats are having but poor shooting at the ducks. Mr. William B. Wells, of Chatham, Ont., who has just returned from a very successful shooting trip to Manitoba, writes me that up to Oct. 20 fowl were scarce on the Canadian side of the marshes.

Still further west I hear of Mr. Elliott Smith, of the Westminster Kennel Club, having fair sport at many kinds of game in Dakota. There are a number of Eastern men out there this season, among whom Mr. John Illingsworth, of Newark, and some Boston friends.

Mr. J. Fred Titchenor, of Newark and New street, has just returned from a five months' visit to California. On his way home he stopped with his friend Mr. Bob Woodward, of San Francisco, at the North Belle Isle Mine Ranch, on Chicken Creek, in northeastern Nevada, close to Idaho. Mr. Titchenor tells me this is the greatest game country left in the United States, that during his short stay he and three friends killed about nine hundred sage hens, prairie chickens and fool hens. They shot the sage hens and chickens, and thumped the fool hens on the head with their guns.

Mr. James L. Anthony, of this city, has gone for two months' shooting to his preserve at Lynch's, Va. He will be joined there later on by Mr. Chas. Heath, of Newark, who is Mr. Anthony's partner in the Graphic Kennels.

Mr. Arthur Livingston Sewell, of Pleasure Bay, N. J., accompanied by Mr. Ben West's pointer dog, went to Mantoloking, N. J., on Saturday for a morning's outing. Mr. Sewell moved fourteen English snipe, of which he killed twelve without a miss. He also secured a fat yelper, which he says he shot a mile high. Lots of wild yellowlegs were on the meadows.

While the majority of places in this country are troubled from a scarcity of game, that is not now the case in Oregon. Six years ago a number of Chinese pheasants were planted in several localities in the State. They were at once protected by a law which forbade their being shot for a term of ten years. I am informed that the foreigners have multiplied in such numbers in the Willamette Valley section that the farmers will endeavor to have the law repealed this winter. They say that the pheasants are destroying their wheat and assert that one pheasant will eat and scratch up more grain than four healthy wild geese. While the cock birds fight like game fowl and occasionally kill one another, the hens overbalance this by raising two full broods every year, and are said never to lose a chick. My informant has just returned to this city from Lane county, and he says there are thousands of pheasants there.

The experiment of raising foreign game in America is a very interesting one. We have seen the success made by Mr. Pierre Lorillard on the Rancocas Farm preserve with both English pheasants and partridges, and the good results secured by the Fisher's Island Club in introducing ground game.

There are a number of gentlemen owners of big estates in this vicinity who have also imported through Chas. Reiche & Co., of Chatham street, this city, large quantities of foreign game. When properly cared for the birds have been found to thrive and increase. I am looking this matter up and may some time give a detailed account obtained from headquarters. The season is now at hand for the importation of the pheasants. They are netted in Germany and shipped in low crates to this country by steamer. These birds are very hardy and afford good sport.

From Connecticut and South Jersey I hear of several rows between sportsmen and farmers. It seems impossible in these days for any stranger to enjoy shooting in these States. For this reason I kill all my quail West, where there is no one to bother me and where I can find more birds in a day than I can possibly move in a week in the Eastern or Middle States. While I respect the rights of the actual landowner I must say the ignorant squatting farmer makes me very tired. There are agriculturists residing on mortgaged farms or on leased property for which they have not paid the rent, who will leave their dinners of cake and pork, run miles in stiff cowhide boots, through green brier swamps, and by their horrible profanity endanger every chance of Heaven, to be in time to see a city sportsman shoot the tail off his pedigreed pointer, such is their enthusiastic desire to assert their authority. Then after driving the sportsman off a neighbor's land or accepting a fee for granting permission to shoot thereon the farmer sneaks home and abuses "down country folks." It is therefore obvious to most people that shooting under such circumstances ceases to be sport, and those who want their fun sandwiched between peace and quiet go and spend their money in the South or West where game is abundant and every petty lessee of land is not a skinflint or a madhouse candidate.

The fact of the matter is there are thousands of crusty farmers who do not shoot themselves, and whose only stock in trade is ignorance, a second-hand collection of farm implements and half a dozen live quail, who are ready to "bite the noses off their faces" to spite some stranger, who, if treated even decently, would open his purse for far more than all the birds were worth. On the other hand, it is the farmer's own neighbors, not the city sportsmen, who tear up stone walls and cut down trees for rabbits. Now, just fancy a city sportsman lifting a ton of rock for a bunny or cutting down a tree. Even if he wanted to do so, he could not handle the rocks, and it would take him a month to learn how to handle an axe before he could chop the bark off the butt. Yet it is the gentleman sportsman who commits all the havoc in the country. At least so says the average farmer. The antagonism, therefore, between the sportsman and the bumpkin of this vicinity is very great and equally senseless. Every one knows that any sportsman who owns more than one dog is usually bowed down with enough care without being pestered by some rustic. The stumbling blocks in the path of sport are too many without having to bump up against every owner of half an acre of ground. To stagger under the all-pervading difficulty of the chase is about all one man can successfully accomplish. Dogs will point cats and go home; boots will gall holes in ankles; briers will assert themselves in the epidermis; game will be *non est;* guns won't hit anything, and tired hunters will sit on snakes or on yellow jackets' nests. Whimsical exaggeration will fill capacious game bags, too, but those who spend their time in figuring on events, say that from careful calculation it is found that the sportsmen of the world, all told, average a walk of two miles for every bird within a radius of thirty miles of any city, and that the average cost of every bird killed under such circumstances is exactly $1.37½. Yet, there are some people who speak sneeringly of the markets where game can be bought. Let these unsophisticated people try a day's shooting anywhere within thirty miles of this city. They will jeer no more. In South Jersey the farmers are angry enough to do anything to the non-resident shooters. Those of Cape May county propose to test the law which gives power to the West Jersey Game Protective Society to issue passes to Philadelphia and New York sportsmen to shoot on their farms. The farmers should remember that the society has spent a great deal of money in re-stocking, and that such farmers who were sportingly inclined reaped the benefit by having good shooting and exorbitant board paid them.

This suggests to me to say that there is one remarkable feature of the shooting around New York, and that is the famous sport always said to be on tap in the immediate vicinity of country hotels. Already has the proverbial partridge bumped his head against each of them this season. The barrooms, as usual, have been invaded by bevies of quail, and the manure heaps in the barnyards have been stamped down level with the ground by the rabbits. But though the sportsman may learn to his disgust that all these signs fail and game is not in sight, yet there is one creature that is never scarce in the locality, and that is the guide. These men are the sand burr of the city sportsmen's existence. There is no getting rid of them. They will rope in for drinks with better success than any race of human beings under the sun. Every man in the hotel bar is a farmer on whose land there are stacks of game. Each one has a team to hire to drive you there. This is always done, for guides are never known to walk except at their own expense. I have heard at least a dozen guides in my life brag how they enjoyed leading city sportsmen astray, where there were no birds, and subsequently killing the game themselves. Warren county, N. J., is full of such men. To beat this business the only way the sportsmen should do is to agree to pay the guide according to the quantity of game shown and shot. So much for guides and farmers.

THE WISE ACRE.

NEW YORK CITY, Oct. 24.

THE CANVASBACKS.

GUNPOWDER RIVER, Md., Oct. 16.—The canvasback shooting season is now opening, and already the shrill whistle of the thieving baldpate, herald of the coming canvasback and redhead, makes itself heard above and below the long bridges of the Baltimore and Philadelphia Railroad across the Gunpowder and Bush and Back rivers; and the sounds of preparation are heard at the projecting points of these rivers, where blinds are being erected and made ready for the coming season. The Gunpowder, Bush and Back rivers and the coves are all more full of duck feed (*valisneria*) than has been known for years. This is what gives to canvasback and redhead the delicious flavor which the gourmet can appreciate.

The whole of Gunpowder and Bush rivers with the many coves and inlets form a paradise for duck shooters. Carrol's Island at the mouth of the Gunpowder stretches in a long narrow point across, and ducks flying from the bay to their feeding grounds up the river cross this bar in rapid flight. Here J. Swan Frick, P. Norris and F. C. Latrobe, of Baltimore, know how to stop the flying birds, which cross the bar at a rate of seventy or eighty miles an hour.

Higher up the river comes Grace's Quarter point, where John Gill, of Baltimore, and Wilmot Johnson reign. Opposite is Maxwell's Point, the old home of Gen. Geo. Cadwalader, now owned by John Cadwalader, of Philadelphia, a home the gunner may envy and where sport and comfort is combined.

From Maxwell's Point to Gunpowder Bridge, with an equal length of shore on Bush River, is the home of the San Domingo Ducking Club. Their club house, about one hundred yards from the water on a rising ground, overlooks the whole river, and with them the season will open on Oct. 18. Of this club H. T. Weld, of Mount Savage, Md., is president and Charles H. Raymond, of New York, vice-president. Robert Sewell, Geo. F. Baker and Warren Delano, of New York, Dudley Olcott, of Albany, R. G. Hoffman, Jesse Tyson, Seth Holmes, John Ridgely, and last but not least, the veteran John Stewart, are the executive committee.

At Havre de Grace, in the head of the Chesapeake, the season does not open till Nov. 1, but the tributaries are alive with ducks long before. Great are the anticipations for this season. Last season was a failure for want of duck feed in the rivers. At San Domingo a lovely little pack of seven beagles makes the whole air ring to the music, and there, too, are setters of unblemished lineage, children of Pride of the Border and Guy Mannering, all owned by Charles H. Raymond, to make up deficiencies of sport when ducks do not fly. X.

OUR FOURTH DAY OUT.

WE had killed a large buck during the previous day and were in fine spirits over our success. Two of the runouts to be watched were quite a distance from camp, and the men delegated to stand at these points started out half an hour ahead of the drivers.

There was frost enough in the air to chill one's blood, but the weather was delightful for a November morning. Our dogs had been of so little use before that we placed no confidence in them, except a small cur with which the first deer was secured. The section to be driven was a long brushy hillside sloping to a stream, while here and there narrow ravines led to higher ground on the opposite side. At the mouth of one of these ravines Doc stationed himself and the balance of the watchers occupied positions along the brow of the hill, advancing as circumstances required.

Down on the point where the drivers started in, an old buck had been lying keeping vigilant watch for the safety of his hide, for no doubt he knew the surrounding dangers, as this was not his first year in the woods.

It was not long until the music of the cur came ringing through the frosty air, and we knew full well it betokened something of interest to us. More and more distinctly the yip, yip, of the little fellow was heard, and in a few moments the glittering antlers and glossy coat of the deer came into view as he fled before drivers and dog. Before venturing across the creek and within several hundred yards of Doc, he stopped to take in the situation. What must have been his thoughts, if deer do think? He had been forced to a guarded inclosure and his pursuers were close on the trail. Not long to decide, however, so at a venture he breaks for the stream. Cautiously approaching the dark ravine and once amid its tangled undergrowth, he again stops to listen. Oh! cruel sentinel crouched behind yonder tree, here where I ran for safety from your murderous hand, outwitted and entrapped. A shot rings out followed by a second and third, the deer plunges through the laurel and crosses higher up stream. We call our party together and hear the story of the man who did the shooting. Of course, the deer had been mortally wounded and could not go far. This we were inclined to believe and took the trail, thinking a few minutes' time would bring us to our game. Alas! the deer kept far enough in advance and flagged us after about an hour's tramp. It was then decided that he had not been so severely wounded as first supposed, but we were determined to have him.

One of the dogs was a sheep killer, and his owner being desirous of getting rid of the animal, recommended him as a good deer dog. When away from camp he followed the drivers very closely and always looked as if he had done something mean when spoken to. The buck kept a respectable distance ahead, and thinking it useless to lead the dog on his trail we concluded to loose him and take the chances. In a little while the barking of all three dogs indicated that they were in close quarters with the deer and we lost no time in reaching the scene. Sure enough, they had surrounded him and a battle seemed imminent. At this juncture a shot brought him to the ground, when the sheep dog immediately began an exhibition of his skill by taking hold and holding on until relieved by the party. This was not our first deer by any means, but we never knew until then what it was to have hold of a wounded buck which we would rather be released from, but were afraid to let go of. After several unsuccessful efforts to regain his feet the poor fellow lay there panting, and without ceremony his throat was cut, and until the last drop of blood ebbed away the lustre of his eye remained undimmed.

Doc occupied an elevated position when he shot and felt positive that the ball had entered the deer's back and passed down through his body; but no wound could be found in that locality. Turning him over a broken and

shattered shoulder was disclosed. The buck ran on three legs, but although his track was seen frequently we were all under the impression, "from the manner in which he ran," that all four legs were in use. Clark volunteered to dress the deer, which he completed in fine style.

The day was not far advanced when we headed for camp, but after a tramp of two miles through briers and over rocks with the buck swinging from a pole borne on our shoulders we decided to call it a day, and right well we could with two noble bucks hanging against the old pine beside our cabin. F. G.

Tyrone, Pa., Oct. 22.

MOOSE IN MAINE.

BOSTON, Oct. 24.—Mr. W. S. Hills, who has killed his moose in Maine, has just returned from his annual hunt in the upper Moosehead region. His departure was mentioned some weeks ago in the Forest and Stream. Mr. Hills is a believer in the protection of moose and deer, but he also likes to try for one in the open season. He took a friend, a Mr. Dewey, of Boston, with him. Mr. Hills did not kill a moose this season himself, but his friend did, though it was a small one—only a two-year-old. They did not get him by the usual method of calling in the night time, but they happened upon him, or rather they heard him in the stream at Poland Pond, near one of those lakes of a hard name, and they worked up to the animal and shot him. Mr. Hills himself killed a caribou, a small one, though it had a pretty set of antlers. He says that he is satisfied—did not care so much for killing his moose this year, but is pleased that his friend succeeded.

Mr. Hills gives rather a gloomy account of the future of the moose in Maine. He believes that that noble animal is fast being exterminated. It is the Indian that is the worst enemy of the moose. Next follows the guide that traps in the woods all winter, and last comes the sportsman from out of the State, who must hunt in the open season or subject himself to very severe penalties. The Indian and the white trapper locate themselves within easy distance of the camps of the lumbermen, and the morals of the lumbermen are weak enough to purchase all the moose meat the hunter will furnish, provided it can be had at a low price. The Indian and the trapper has the hide, and possibly the horns, and he manages to smuggle them out of the State some way and thus to sell them. Mr. Hills is positive that the destruction of moose, deer and caribou by that class of men is something frightful for the sportsman who is fond of legitimate moose hunting to think of. The worst hunting is done on the crust late in the winter. Then the hunters kill all the moose and deer they can approach, and they manage to approach about every one, provided they know the section well and the location of the yards. Why, the officers of the law have been after an Indian this very fall, known to have killed moose in close time. They found him and they searched for moose meat, since he had sold some to other parties only a few days before. But they did not find it. They then searched his cabin for hides. These they did not find, though the Indian has since made his brags that there were ten moose hides in the hut at the time, the results of his hunting this fall and last winter. The hides were under his squaw as she sat on the edge of the bed. The officers dared not molest her. This Indian is already for the woods again this winter, and the lumbermen buy all the moose meat he will furnish. Yet he is only one of hundreds who infest that State and the province of New Brunswick. The Indians are both cunning and dangerous, and it takes a good deal of courage in a game warden to attempt to bring one of them to justice. Indeed they can only be restrained by enlisting the lumbermen, and the lumbermen are not very likely to enlist in the work of stopping their supply of cheap beef. The Yankee trappers are less harmful than the Indians, but they do hunt moose in winter, and in the summer close season. A year ago, Mr. Hills remarks, it was well known to the hunters who went into Maine for moose in the upper Moosehead region that four moose had been killed on a certain stream, before the law was off. It was generally supposed that it had been done by a low class of guides who follow trapping in the neighborhood of the lumber camps in the winter, but just how they met with such success was a mystery. There were the parts of the moose killed, that were too heavy or too worthless to be taken away. This year it has all come out just how the moose were killed. The three guides were paddling up the stream, when they heard moose in the water ahead. By carefully working their way up they came within shooting distance. There were seven moose—four bulls, a cow and her two calves of the two seasons previous. The bulls were evidently following the cow, it being near the rutting season. The guides each shot his moose at the first volley. But curious enough the cow and calves did not start, and the remaining bull, now that his rivals were down, would not desert her. One of the guides, more fond of killing than the rest, shot down this bull also. They now had more moose than they knew what to do with, and, to cap the whole story, the cow and the two calves frightened away by the last shot, soon came back and stood near their fallen companions. The story goes that the guides would not shoot these moose.

Mr. Hills believes in the protection of moose in Maine. In fact he is anxious that they should be protected, in order that a sport very attractive to himself shall hold out. He says that he is ready personally to obey any law that the State may make for the protection of her game, but he believes that the enforcement of the law has been going on at the little end of the trouble. It has assumed a sort of a desire on the part of the Commissioners to persecute the "gentleman sportsman from Boston," and to mulct him in all the damages possible. The Commissioners cannot but be aware of the wholesale slaughter of moose and deer that is being carried on in the winter, yet how many cases are there on record where a lumberman has ever been troubled in the taking of all the moose he desired on which to feed his men? If they have it has not been published in the papers. Yet the sharpest wardens are stationed in the fall to watch the sportsmen who come into the State and leave hundreds of dollars. If they are caught breaking the law by so much as killing game on Sunday, which by an old relic of blue laws is made a close time, even in the otherwise open season, such sportsmen are made to pay all that can be exacted of them. It is all right to enforce the law with a just and even hand, but the lumberman and his accomplice in the crime, the winter trapper and crust hunter, should each be made to feel the force of the statute. That this has not yet been done is plain, if the records of the game law enforcements in Maine are worth anything. If the noble moose is to exist in Maine, this winter, hunting for the mere hides and meat must be stopped. In the neighborhood of Kineo there is a notable growth of the right sentiment among the guides. They talk of forming a sort of society among themselves to prevent the destruction of moose and deer in the close time, and they are agreed that if the State will grant September, or even a half of it, as open season, that they will do all in their power for the enforcement of the law, or at least to prevent the unlawful killing of moose, deer and caribou. They begin to understand, the more intelligent of them, how great the value of a single moose, alive in the woods, is to them, and this value they mean to follow up. This is the proper sentiment, and it is possible that a little missionary work, paid for by the State, might do more good than the whole amount of fight which has been put heretofore into the work of game protection. The territory to be covered by the fighting system is something enormous, and it would require a small army of officers and wardens, and even then they could not enforce the law except partially. But once get the ideas of the guides up to the value of these animals to be hunted for by those both able and willing to pay for the sport, and the work of game protection would be done. Game Laws.

The Jumbo Moose.—For over ten years a moose of gigantic proportions has been the wonder and the pride of trappers and hunters who have lived or hunted in that part of Maine known as the Seven Pond, or Dead River, country, located in the northwestern part of the State and along the Canadian line. In all these years this moose, which finally became known as Jumbo, has been in pretty close quarters with huntsmen seeking his life, but he has always succeeded in escaping from impending danger. Rewards have been offered for him, dead or alive, by prominent naturalists, and stimulated by this hunters have put forth extra efforts to secure him, but without avail, until last Saturday, when he met his doom. On that day Augustus Douglass, Albion Savage and one other person, all residents of that section, were out hunting, when they suddenly came upon Jumbo, quietly grazing about fifteen rods from them. He was accompanied by a cow and a young moose, and was apparently wholly unaware of danger. This was an opportunity which these men had been awaiting for years. Douglass was armed with a .38-cal. Winchester rifle, and, taking steady aim, he fired one shot, which took effect behind Jumbo's shoulder. The monarch of the forest merely raised his head, sniffed the air, and made no effort to get away. Four more shots were rapidly fired by Douglass, and it was not until the fifth shot had entered his body that he yielded and fell to the ground. He was dead in a few moments, and the carcass was at once conveyed to the home of the hunters and found to weigh 1,500lbs. The body was skinned, except the head, and the hide and head were shipped to E. M. Messenger, of the Bromfield House, No. 55 Bromfield street, where it is now on exhibition. The distance from the base of the skull to the tip of the nose measures 27in.; from the burr to the tip of the horns or antlers is 31½in., while the entire length of the horn, measuring along its course, is 3ft. 2in. The widest space in the palm of the horn reaches 7¼in., and the ears measure 12½in. The stretch of country along which this moose traveled generally is along the Canada line, and from this fact Jumbo was also known as "the boundary line moose."—*Boston Herald, Oct. 21.*

ADIRONDACK GUIDES.

BROOKLYN, N. Y.—*Editor Forest and Stream:* The inclosed clipping from the Boonville *Herald* came under my notice this morning, and having just returned from the woods, know that the facts stated are only too true, and as my views are so nearly in accord with those expressed I could not refrain from sending the same to you, hoping that you could use it or make some pointed remark on the subject, or both. By so doing it will be brought more to the notice of true sportsmen, and in the near future I hope something may be done to do away with the evil practice. C. B. P.

The *Herald* says: "The capture of the four sportsmen from Troy, in the region of the south branch of the Moose River, is a feather in the cap of State Game Protector Drew, who is to be congratulated upon his successful efforts. That there was an open running of dogs before the season opened (the crime of which the Trojans paid the penalty) there is no question, and it is to the credit of Protector Drew that he kept watch of parties and was rewarded by bringing them to justice. The Troy party was composed of a clever lot of fellows, it is said, and might have thought running dogs no worse than floating, but the game laws should be observed to the letter, and it is useless to the interests of game protection to permit the violation of the law in one section and enforce it in another. From Blue Mountain to Raquette Lake guides have brought their parties to the Moose River region and encouraged them in defying the law, or for a paltry sum allowed them to hunt in season or out, according to methods which the law forbids. It is time a stop was put to this practice and the guides and sportsmen should rise up in arms against the poachers who unlawfully rob the woods of the game that is none too plentiful. If the game protectors appointed by the State cannot attend to the law-breakers, it devolves upon the sportsmen and guides to use every means for game preservation. A few more protectors like Mr. Drew would do much toward arresting guilty parties and make it so warm for others that they would not dare to continue their violation of the law. The place for every game protector during August was in the woods on duty, and if such had been the case there would have been fewer dogs run out of season and less violations of the law. Another evil agency of game extermination is the going into the woods of a lot of ignorant unprincipled persons to act as guides, and who will stoop to any mean device for money. They attend a lot of would-be city sportsmen and by fair means or foul get their fish and venison. One of the most honored sportsmen who goes to the North Woods recently penned the following: 'My views about the loyalty of guides have undergone a material change the past year. I have heretofore defended them as a class against the accusation of many good friends of the law who have no faith in them. I am prepared now to join the latter in classing them not only as aids and abettors of poachers, but as poachers themselves. They have become, under the heavy feeding of cockney sportsmen, as ready to break the law as the most unscrupulous pot-hunter, when they were paid for doing it.' Such language is strong, but as it relates to some of the guides of the Adirondacks, it is too true. Would that these pernicious poachers, be they guides or others, could be driven from the forest preserve. It is said that the hardest thing Mr. Drew had to encounter in his recent raid was the treachery of guides. Such guides should be scarce in the Adirondacks, and are by their own acts killing the goose that lays the golden eggs."

A DAY IN THE WOODS.

WHAT wonders time will work. What a change a few years will make in the appearance of a place. How vividly some of the "good old days" contrast with some of the present. Almost everywhere one can note the change. The finger of time or the busy hand of progress shows itself to the hunter and lover of the forest where he was before only accustomed to find the woods in her primeval state. When one stops and compares ten years ago with the present it comes home with full force that the good old hunting times are fast disappearing. Ten years ago the woods here were teeming with game of all kinds, especially bears and deer. When one went in the early morning the silence would only be broken by the "music" of the hounds driving a deer to the water or the sharp crack of the hunter's rifle. But now? Oh, what a change! On every hand, in every one of the old haunts of the hunter, your ears are filled with the noise of wood choppers, the hum and sing of the sawmills, and in the distance the sharp, shrill whistle of the railway engines. All go to make up not the most agreeable sounds in the world to the hunter when he is watching the banks of the river for a deer as it seeks the water. Then, there was abundance of sport with comparatively little labor; now, there is any amount of work with sometimes but little sport. But this is digressing. I must to my story of our day in the woods and what it amounted to.

The deer hunting season opened in Ontario on the 15th, and on the preceding night five of us prepared to have a hunt. There were Allan, Ed, Will, Fish, as we had named Bill H., to distinguish him from Will, myself, and Zip and Bugle, our two dogs. The morning of the 15th came around, and with it, Allan's voice on the fence outside roaring in stentorian tones, "Get up you sluggards; it's daylight an hour ago." At that Fish and I bounded out of bed, dressed ourselves and rushed down stairs, only to find Will seated by a nice hot stove, and the hour only half-past four. That didn't bother us though, for we set about chatting what each of us were going to do that day. By and by Ed came down, looking pretty sleepy, and intimating that he wouldn't mind staying in a while longer. That he couldn't do, for it was breakfast time for us if we wanted to get into the woods early. That finished, Allen came along and we made a start, a little while before old King Sol made his appearance on the horizon. Zip and Bugle seemed to know there was fun ahead, for we could hardly restrain them. Allan and Fish took the dogs to put out, and Will went along with them to watch a runway or two. Ed and I took our boat and went a couple of miles up the river. Ed stayed on the left bank to watch two runways that came in on the opposite side, and I took the boat and went a little further up to watch a small stream and runway above.

Now everything is settled. All the inlets are guarded. All that we have to do now is for the dogs to bring the deer down for us to shoot.

The morning was sharp and frosty, and I whiled away the time by tracing in fancy the hunting scenes I could see in the wreaths of smoke as they rose up in the clear, still air. This lasted until my toes began to get cold, which necessitated my moving around somewhat, but not enough to make any noise.

Hark! What was that? The baying of a hound, as true as I live. Now the blood begins to tingle in anticipation of fun ahead. Now the hand closes with a tighter grasp on the rifle. Now the eye flashes with a keener light. The wreaths of curling smoke and cold toes are forgotten, for the hunter's reward is almost to him.

Oh, pshaw! The deer has circled and is going away. Wait! The hounds have turned and are coming this way again. Now we will have a shot anyhow. But hardly is the thought formed when—bang! bang! The tongue of the hound ceases, and all is still again.

Has some one cheated us out of our game, or is the deer in our party? As these meditations run through my mind, crack, crack, crack, three shots, ring out sharp and clear, a signal that the deer is dead and killed by one of our party.

Ed and I cross the river and push through the belt of woods about a mile in width, where we come upon marks that show where a deer has been dragged. This we follow, and only catch up with the boys as they reach the house we had started from a few hours before. To Fish belonged the honor of the day so far, and he bore his part well, though a sly glance would once in a while find his face wreathed in exultant smiles of pardonable pride, for the deer was a nice buck that dressed something over 150lbs. We all took a hand in dragging him to the station, where he was shipped off to some friends.

This was not enough for Allen and myself, as the hands of our watches only showed 9 o'clock, so Allan, Fish and I started out for more glory. We all went back to the same part of the woods, and after agreeing that Allan and Fish were each to start a dog, I went to hunt up an old shanty from which I could watch a runway. I shall never forget the search I had, over hill and down dale, through green woods and burnt slash I tramped, but no shanty rose into view. I was getting somewhat tired of that kind of work, so I perched myself up on a high log to take a short rest. I had not been long there when suddenly I heard the light footfalls of some animal approaching me.

Now for a shot, says I. Pit-a-pat, pit-a-pat, came by the sounds rustling in the leaves and the gun was already at my shoulder, when Bugle rose into view instead of my expected deer. This was a surprise and a disappointment to me, for I longed for a shot at a whitetail. Crack! went a rifle in the direction where I had left the others. Crack, crack, crack went three more, the signal agreed upon. Surely, said I, they cannot have another deer

already. Still I tarried, but three more shots decided me and I hurried back as best I could and found the boys seated upon a log. "Not much this time," greeted Allan. "Well, then, what in the dickens is all this fuss about? Where is your deer if you have one?"

"Oh, it's only a little fawn; go and look at it." I went and looked at it and there lay as pretty a buck as I ever saw. This one was Allan's deer.

Whether it was asleep or not I don't know, but he got within 20yds. of it before he discovered it, and there it was lying where it had been all night before. A bullet through the head had laid it low forever. Perhaps it was not a tug to get him out of the woods, for he was no plaything. Dressed he tipped the beam at 258lbs. After hanging him up in a safe place we concluded that we were too tired to do any more. So ended our first day in the woods. TCTEL.

CASSELMAN, Ontario.

MR. GARETT'S GAME PRESERVE.—At Uplands, Mr. Robert Garrett's country residence, at the junction of Edmondson avenue and the old Frederick road, the owner has established a miniature game preserve. Up to the present the only game on the preserve are English pheasants, of which there are about two hundred. The eggs were imported from England about one year since. The first lot, numbering seven hundred, failed to hatch, but a second lot, that were packed under the directions of Mr. Garrett's gamekeeper, produced good results. The eggs were placed under common hens, and when the birds were hatched they were hand-raised and then turned loose on the preserve, which consists of about twenty-five acres of wood and open land, inclosed with a wire fence about four feet high. The birds, though nearly grown, have not taken to the woodland, but disport themselves in the open. The male birds are very beautiful, and present a tempting sight to would-be poachers as they run along the ground. But the only poachers that the big stalwart gamekeeper has had to contend with so far have been what he termed "varmints," which include coons, opossums, bats, rats, weasels, etc., with now and then a bird hawk. The gamekeeper, who was imported from England with the birds, is a typical English keeper. A Yorkshire man himself, he brought with him a Yorkshire terrier, which assists him in his labors. The birds all know him, and do not appear much frightened when he approaches them, and he is careful not to let strangers go near them unless he is in the lead. Immediately adjoining his lodge he has enormous wire coops, in which he has a number of old birds, that have to be viewed from a distance, as the keeper fears they would rise on the wing at the approach of a stranger and kill themselves against the wire covering. To avoid accidents of this kind a fine specimen of the English bull-terrier is stationed near the coops, where he can keep guard in the absence of the keeper. The little Yorkshire terrier is thoroughly broken to his work. He is the constant companion of his master, and if any of the birds leave the inclosure he finds them and cautiously assists to drive them back. He will not let a stranger pick up even an acorn from the ground, much less handle a young bird. Scattered around in the neighborhood of the birds are a number of coops, in which are confined common hens with broods of young chickens. When these chickens reach the proper age they will be used for the purpose of hatching out pheasants. When the day for the shooting arrives the birds will be scattered as much as possible, and then the gamekeeper and his assistants will beat the cover, and as the birds fly over the sportsmen the air will be filled with shot holes, and the gamekeeper will probably be instructed to bag enough game for the lunch which follows the shooting. At least that is the programme as interpreted by a gentleman who claimed to know all about the shooting business as conducted on game preserves.—*Baltimore Sun.*

DELAWARE GAME LAW.—The late Legislature passed a game law which provides that it is unlawful for any person not a citizen of this State to hunt, kill, take or destroy, sell, or expose for sale, or have in his or her possession, after the same has been killed, any partridge, quail, woodcock, grouse, rabbit or hare, reed bird, ortolon or rail, unless he shall have first obtained a license from the Delaware Game Protective Association. Under the provision of the amendment the licenses are to be issued upon the payment of $25 each, which, however, will not permit the killing of any game bird mentioned above for market or sale. One-half the license money is to be paid the game association and one-half to the school fund to be divided be ween the three counties. The hunting of any of the game above mentioned while the ground is covered with snow is also prohibited under a penalty of $5. The quail season does not open until Nov. 15.—V. M. H. (Milford, Del.).

LATIMER, Iowa, Oct. 18.—Prairie chickens are quite plenty now, and are packed in large coveys. The shooting is better than it was in September, as the birds are more readily found in the cornfields. About the 1st of September, G. W. Myers, a farmer living near this place, was out hunting chickens with an Irish setter. The dog came to a point on a small knoll in a stubble field. Mr. M. being back under the hill, but within shooting distance, saw a covey of seven birds standing up in the short stubble near the dog, and what was the most remarkable part of all, he fired seven times and killed the seven chickens, none of them moving or taking wing. Cranes are moving now, but no ducks or geese yet; a few cold rains will bring them down from the north. We do not have any fall jack snipe shooting, but always get some golden plover. The FOREST AND STREAM is eagerly looked for here, and the older it gets the better it is.—RAND.

AUGUSTA, Ga., Oct. 15.—To-day the season opened on quail and nearly all other game in this county. The weather is yet too warm and dry for successful shooting and much will not be done until after a rain. Although the August freshets drowned out many of the swamp birds, yet the crop of highland birds are reported quite plentiful. We are expecting great sport in about two weeks.—J. M. W.

NEWBURGH, N. Y., has a number of Sunday gunners who regularly drive out on that day with dog and gun. Where is our game protector?—STORM KING.

THE AUTOMATIC SHELLS.—Salmon, Neb.—*Editor Forest and Stream:* Your correspondent "W. H. D." asks about the automatic shrapnell shell scratching the barrel in its exit. It will. I fired one from a new and bright gun and the marks are plainly seen. They shoot well but I should not like to use them in a fine gun.—J. F. LAYSON. FORT SHAW, Mont.—"W. H. D." wants to know if John's patent automatic shrapnell shell would scratch gun barrels. As far as I have tried it I do not think it will. I have fired six rounds out of a 10-gauge Remington and fail to find a scratch. The way I load is to use paper shell, 4½drs. powder and one Winchester pink edge wad; take expelling pin out of crimper, crimp shell good. At a target at 100yds. 9x9in. I put in 36 pellets No. 5 shot; penetration fine.—R. H. W.

SALEM, Richardson County, Neb., Oct. 15.—Quail are more plentiful here this season than last. Few have been killed since the hard winter of 1884-85, and the past season has been very favorable for hatching. Prairie chickens did well, but the city sportsmen got them in August before the law was off. It makes me "red-headed" to locate a few broods of chickens and then hear the guns of the "city chap" knocking them over while I am waiting for the open season.—J. F. L.

Sea and River Fishing.

Addresss all communicattons to the Forest and Stream Pub. Co.

LONG ISLAND SOUND.

THE fishing in Long Island Sound north of Greenport is always good, especially for sea bass and blackfish. Those fish coming in from the ocean, first reach the rocky coast west of Orient Point, and there find abundance of their natural food among the sunken reefs and rocks for a distance of twelve or fifteen miles, as far as Horton's Point. Beyond that point, further west, the shore is sandy and the bottom free of rocks, so that fish are not found there. The in-shore west of Orient Point is lined with rocks; and outside in the Sound, for a considerable distance, lie submerged reefs, where fish resort in great numbers.

The fishing here this season in the inside bays, Peconic and Gardiner, has been unually good, especially for sea bass, blackfish, weakfish, bluefish and porgies, and also in the waters around Montauk Point. Some two weeks since we passed three days in a yacht near Bostwick Rock, Gardiner's Island, where we enjoyed excellent sport with the sea bass and blackfish, taking also in the creek plenty of round clams and hard crabs. It was then too early for fowl, and we saw but few flocks of coot and no black ducks; but late in this month there will be abundance of coot, sheldrake, old squaws, etc., in these waters. Many of these fowl are shot by sailing on them, and this practice is allowed by a special act of the last Assembly.

Several years since the fishing in these bays was unsurpassable, but the placing in them of countless numbers of fish pounds has almost spoiled the sport. The fish, coming in from sea, follow the line of shore instead of the deep channels, and so are captured by those set nets that extend from the edge of the shore outward for twenty or thirty rods, and this plan is most injurious to the hand line committee, and is the occasion of strong protest and fearful condemnation. The fish so taken are iced, boxed, and sent to New York markets, where they supply food for the million, but leave but little sport and spoil for the resident anglers of these shores. ISAAC MCLELLAN.

SHEEPSHEAD.

SHEEPSHEAD, which are considered the best salt water fish along the coast come into the inlets and bays of New Jersey about the 1st of June, are most numerous in July and are found in those waters until October. In years past they were numerous in all the inlets and bays from Barnegat to Cape May. This season, as with the drum, very few have been found; and most that have been caught were taken at the wrecks outside of the beach. A number of years ago a good many men alongshore made a good part of their living fishing for sheepshead in the season, which were readily sold from 6 to 10 cts. per lb. Myself and Kale Parker, no doubt well known to some of you readers, caught 105 in two tides in the channel of Barnegat Inlet with hook and line. I speak only of hook and line fishing. They weighed from 6 to 12lbs., average about 9lbs. There I caught my largest sheepshead, 16½lbs.; I showed it to some of the fishermen who came alongside, as being the "boss" fish. One man, Criss, showed one that he had just caught weighing 22lbs.; it was the biggest sheepshead I ever saw.

At the cross channels of Manahawkin Bay many were caught; in the channels and at the Anchoring Island of Little Egg Harbor sheepshead were plenty and readily taken. Just outside of the Inlet was about the best ground, called the Sods. Years ago these Sods were a low island, and at low water a famous place for shooting sea birds. The island was washed away leaving only the Sods in some 12ft. of water upon which black mussels grew and sheepshead gathered there to feed. It was not unusual for from 20 to 40 to be taken by one boat when the weather was such that boats could lie there. I have counted 62 boats at one time. Since then the beach has made out and covered that part of the Inlet. At Great Egg Harbor, Hereford and Rio Grande Inlet very many sheepshead were caught formerly. This season there were very few.

The disappearance of sheepshead must cause a considerable loss of revenne to the people alongshore. What has become of the fish? have they disappeared from some physical cause in their usual places? Perhaps some of your scientific readers can explain. In Barnegat Inlet there are now none of the black mussels that sheepshead used to feed on there, and this may account for so few fish being there; but at Little and Great Egg Harbor the black mussels are taken away by the hundreds of tons for manure; the sheepshead were not there; perhaps like the drumfish they have been gobbled up by the purse-nets of the fish factories and their race that used the coast are nearly exterminated.

Sheepshead have given the most interesting fishing in these waters because they are real game and the most valuable of any fish caught there. Every one taken is of so much value to the fishermen, hence the great interest and sport. There is no pleasure for sportsmen to catch fish simply to kill; they must be of use to make the pursuit interesting.

The bait for sheepshead in the channels is open soft shell clam or black mussel, but at the wrecks or where small fish are bad on the open bait whole soft shell clams or small sand crabs are used, sometimes fiddlers or surf bugs, but they are not of much account. I fish out of a small boat with a 9ft. rod and reel and 18 thread line. The man with me (there is no fun fishing alone) fishes from the stern with a hand line, so our lines do not become tangled, and I can fish over 18ft. of space, which cannot be done with hand lines in a tideway. In all my fishing I have never found sheepshead to bite on both flood and ebb tide. I think they feed on one tide and on the other sleep and digest their food. PURVES.

PHILADELPHIA, Oct. 14.

FISHING NOTES.

PICKEREL seem to be not only abundant this season in the lakes and ponds of New Jersey, but unusually hungry, considering the large amount of feed in these waters. On Saturday last "Curly" McCracken, of Hackettstown, caught a fine lot of fish in Allamuchy Pond, in Warren county. A few days previous a local fisherman took the largest pickerel ever seen in the pond. It was an old-timer and weighed over 8lbs. Instead of making a great talk over his catch the successful angler had a level head, kept his mouth shut, and went back the next day and yanked out a lot more of big fish and had the pond to himself.

While it is said that black bass have stopped biting in the Delaware River, Lake Hopatcong and Greenwood Lake, such has not been the case in the Allamuchy Pond, Decker Pond, on Pochuck Mountain, or the Wallkill. Some fine pickerel are being taken in the two last named waters, as also in Double Pond, on Vernon Mountain, in Sussex.

There has been and is, as far as I know, some quite good black bass fishing in several of the feeding ponds of the Morris Canal between Waterloo and Hacketts-town.

The striped bass fishing has been remarkably fine this autumn everywhere. The catch at West Island has exceeded that of many previous years. The run of fish was very large. Plenty of bass have been taken off the Newark Bay bridge, many of good size. At Gifford's, Staten Island, at Ettingville, at Hell Gate and all along the shores of the Hudson, anglers, with sand worms for bait, have had sport. Between King's Bridge and Dobb's Ferry I counted from the car windows eighty-three bass anglers the other afternoon.

In the Shrewsbury a week ago there were plenty of biting bass, as there were also in Barnegat Inlet two weeks previous. The fishing in the former place has now ceased. Off Long Branch and down the Jersey coast and off Montauk, L. I., many big bass are being taken in nets. South, the fishing for "rock fish," as the striped bass are called, continues to be very fine in the Potomac River. W. A.

NEW YORK, Oct. 24.

QUEBEC TROUT FISHING.

DURING the month of September last Mr. Bucke and I spent a few days very pleasantly with the trout in the townships of Clarendon and Thorne in the Province of Quebec.

We left Aylmer on the evening of Friday, Sept. 23, by the Pontiac and Pacific Junction train passing north at 6:15 P. M.; arrived at Shawville at 8:25, and drove to the residence of Mr. R. McJanet, postmaster at Yarm, about 2½ miles distant, where we arrived about 9:30 P. M. Mr. McJanet did not expect us as we had written to him a few days before saying that we could not go at present; but he did not take long to show us that we were welcome and that he intended to make us feel at home and enjoy our visit, which we certainly did, thanks to the hospitality of himself and his energetic and kind wife and family.

The next morning we drove to the River Quyon, about four miles distant, and afterward visited two small lakes (names not known to me), near there, where we managed to basket about thirty nice, though not large, brook trout. The scarcity of water in the river, owing to the dryness of the year, and the approach of the breeding season, had the effect of causing the trout to seek the deeper water of the lakes. Had we been able to get a boat on the small lakes I fancy that we should have had some excellent sport, as the fish were rising almost incessantly about 150yds. from the shore.

During the day, Mr. Bucke was successful in bringing down a wild pigeon and a partridge.

The next day being Sunday we strolled over to Green Lake, about a mile from Yarm, and called upon Mr. Judgsen, whose house is beautifully situated among the trees on the hill just above the lake. Mr. Judgsen kindly lent us his canoe, and we took a short paddle down the lake—a lovely sheet of clear and evidently very deep water. Certainly one could not wish for a more beautiful situation for a house than that occupied by Mr. Judgsen. It is in every respect charming. They said there were trout in the lake, but of this fact we were not able to satisfy ourselves. In the evening we all went to hear a learned divine hold forth in the schoolhouse at Yarm and were struck by the zeal and earnestness of the worshippers (Methodists, principally, I fancy), and I think they must have been struck at our "fishy" appearance, as we had only one suit of clothes each with us.

On Monday we tried the Quyon River, about seven miles from Yarm, and met with fair success, but the fish as before were not large. At 4 o'clock in the afternoon we started for Phillips's Lake, about three miles further north. In this lake, casting from the shore, I took six nice trout in about an hour. Mr. Bucke and Mr. McJanet tried trolling, but did not get anything, nor did they take any trout with bait. It is evident from the appearance of the water in this lake and from what we heard, that during the proper time of the year, the trout fishing must be excellent, and we are determined to pay it a visit during the spring of 1888. The scenery about Phillips's Lake is beautiful and one might get accommodation at the house of Mr. Trudeau, not more than 100yds. from the spot where I caught the trout in the lake. He has a large punt which only requires a few repairs to make it watertight. It

seems to me that this is just the place for a party to spend a few weeks during the fishing season, as it is very accessible and by no means an expensive trip from say Ottawa. However, I hope to be able to write more fully on the subject after my next visit.

WALTER GREAVES.

OTTAWA, Oct. 17.

THE VERMONT TROUT SEASON.—I noticed in the FOREST AND STREAM of Sept. 29 an article taken from your paper in which you say, "Some years ago C. F. Orvis, of Manchester, and others interested in trout fishing in the western part of this State, took ground before the legislative committee in favor of closing the open season for trout the 1st of August." That is a great mistake, and I wish you would correct it, as I do not wish to be on record as advocating what appears to me to be a very foolish idea; I have always urged extending the open season for trout until at least the 15th of September. In 1882 I was requested to draft a new law by one of our Fish Commissioners, who wrote me he knew very little about the matter, which statement I believe was true then and now. He invited me to meet him at Montpelier, to confer with him and go before the committee. I went to Montpelier, but found the Commissioner was in Boston, and no one appeared to know whether he would ever come back or not. I then endeavored to go before the committee, but they did not meet while I was there. I left in proper hands a draft of a bill from which I now quote as follows: "Amend Section 3,872, page 751 Revised Statutes of 1880, fourth line, in place of 'first day' to read fifteenth day." That does not look much like August 1st, does it? Mr. Editor, you must have forgotten a long argument I had with you on this very point, in which I endeavored to prove to you that no trout in a natural state ever spawn before Oct. 1 in Vermont, and I urged very strongly the extension of the open season to Sept. 15. The fact that the trout have spawn in them in August only proves that fact, and nothing more. Many people suppose because they see trout in schools in August, that it is for spawning purposes. That is a mistake. If it is necessary I can show by the best authorities on the subject that I am correct. My own observations have extended over forty years. I once took great interest in the fish and game laws of this state, hoping some good results would come from them, but I must say that I believe nearly all the legislation has been a damage instead of an advantage, so far as trout are concerned. Now, Mr. Editor, please put me right before the public in this matter, and let me say again; extend the open season for trout to at least Sept. 15; cut off the first half of May, if you choose; repeal the "obnoxious posting law"; make a law against selling or purchasing trout under 5in. long, and establish a State hatching house.—*C. F. Orvis in Montpelier Argus and Patriot.*

MESSRS. S. ALLCOCK & Co., of Redditch, have been awarded the first order of merit for their exhibit of fish hooks, fishing rods and fishing tackle at the Adelaide Jubilee Exhibition.

LOBSTER CULTURE.

BY R. RATHBUN.

(Concluded from page 250.)

LOBSTERS are found with spawn attached to the abdomen during the entire year. This fact is recorded of both the American and European species, but the length of time they are carried before hatching and the limits of the hatching season are not precisely known. As regards the European crayfish, a fresh-water crustacean, closely related to the lobster, Professor Huxley states: "The process of development is very slow, as it occupies the whole winter. In late springtime or early summer the young burst the thin shell of the egg, and, when they are hatched, present a general resemblance to their parents. This is very unlike what takes place in crabs and lobsters, in which the young leave the egg in a condition very different from the parent, and undergo a remarkable metamorphosis before they attain their proper form."

The smackmen of the southern New England coast claim that the eggs hatch in the wells of their smacks in the greatest abundance, from some time in May until late in July, but that at other seasons they have never seen any embryo lobsters, although the smack trade in lobsters is kept up during nearly the entire year. During the season mentioned the surface of the water in the wells of the smacks often becomes perfectly alive with the young, and they may be scooped up by the hundreds of thousands. This evidence is tolerably conclusive as to the duration of the principal season, and determines the period when experimental work in artificial propagation can best be undertaken. The fact that a few of the eggs contained in the jars at the Wood's Holl station of the Fish Commission hatched during November of this year, indicates, however, that some hatching may take place at other seasons, as the conditions under which the eggs were kept were perfectly normal, the water being of about the same temperature at that of the harbor outside. Hatching is supposed to begin somewhat later further north.

The writer was, at first, inclined to believe that the hatching continued to a considerable extent through the entire year, basing his conclusions upon the fact that, during the months of August and September last, eggs were found in various stages of development, from the fresh-laid and totally opaque ones to others in which the dark greenish yelk sack occupied scarcely more than one-half of the area of the egg, the remainder being transparent and clearly showing the structure of the embryo. Some of these eggs preserved in the hatching jars were carefully examined from day to day, and although they exhibited a certain amount of progress, development was slow. It finally became evident that the development of the eggs was being retarded by some cause, presumably the lower temperature of the water, and this result, coupled with the statements of the fishermen, that embryos are seen only in May, June and July, makes it probable that the hatching of lobster eggs at other seasons is only an accidental or occasional occurrence. It is also not at all improbable that the young hatched during cold weather perish soon after they leave the egg, as they did at Wood's Holl in November last.

The hardy character of the lobster eggs, before referred to, favors the idea of a long period of development, and they appear to be well adapted to endure the hardships of a long winter. The rough handling to which they were sometimes subjected, in connection with the experiments of last summer, did not seem to harm them in the least. It is also probable, from this quality of the eggs, that they are not destroyed to any extent in nature, unless actually eaten from the swimmerets of the parent by predaceous fishes, and that the chief assistance which artificial culture can give, in an attempt to increase the supply, must be directed toward protecting the embryos from the period of hatching.

Embryo lobsters are seldom seen at the surface in the open waters about our coast, and have rarely been taken in the towing net. Prof. S. I. Smith, who has studied the younger stages, obtained his specimens during July, mainly in Vineyard Sound, near Wood's Holl, Mass. Nothing positive is known respecting the habits of lobsters during the spawning season. It has been stated with reference to lobsters marketed in Boston, that berried lobsters are seldom seen measuring less than about 10½in. in length, and it is probable that they rarely begin to spawn before attaining that size. However, a few smaller ones were observed at Wood's Holl during the summer of 1885. In a lot of fifty-two berried lobsters, examined at that place in September, three measured less than 10in., the smallest having been 9½in. long; eight were between 10 and 10½in.; ten between 10½ and 11in.; fifteen between 11 and 12in.; eleven between 12 and 13in., and five between 13 and 14in. The measurements were made from the tip of the rostrum to the end of the telson, not including the hairs.

The development of the younger stages of lobsters has been studied by Prof. S. I. Smith for the American species and by Prof. G. O. Sars for the European. The eggs, when first emitted, are entirely opaque, and of a dark green color, sometimes almost black. Prof. Smith examined the well-advanced eggs at Wood's Holl in May. They were not perfectly round, measuring a trifle more than two millimeters (about one-twelfth of an inch) in their longest diameter. One side was still dark, due to the unabsorbed yelk mass, and the other more or less transparent, showing the eyes as two large black spots and the outlines of the carapax and legs. All of these features are readily made out under a low-power objective. Soon after hatching they measure about one-third of an inch in length, and resemble in appearance and structure a low group of shrimp, called the schizopods, which are common on some portions of our coast. The eyes are bright blue, while portions of the body and its appendages are marked with orange of different intensities, rendering them very conspicuous objects. The swimmerets are not yet developed. In the second stage, which resembles the first, they have increased somewhat in size, and have obtained the rudiments of a portion of the swimmerets. In the third stage they measure about half an inch long, and the shell has become firmer than before. In the next and last stage observed, the embryo is about three-fifths of an inch long; it has lost all of the characters in which it resembles the schizopods, and has assumed the more important features of the adult. It still retains the free-swimming habit, and is very active in its movements, frequently jumping out of the water by means of its caudal appendages. This stage was frequently taken from the 8th to the 20th of July, and Prof. Smith thinks that the larva passes through all of these stages in the course of a single season. The stages immediately following the above were not observed.

The young, like the adult lobster and the crabs, increase in size by moulting or casting off the shell covering the body, a new shell rapidly forming in place of the old one. During the first season, as above described, the molts are frequent and the embryos remain at the surface of the water as free swimmers, but how long the young, after reaching the lobster-like form, retain this free swimming habit was not ascertained. As the lobsters increase in size it is evident that molting occurs less frequently and in the adults probably only once a year.

The rate of growth of lobsters has not been determined, and at present we have no means of telling the age of a lobster measuring 10in. in length. A few measurements have been made, showing the amount of increase at certain molts, but it is not always constant, even for lobsters of the same size, and not knowing the frequency of molting or shedding we have no way of computing the rate of increase. One lobster measuring 8in. before shedding was said to measure 10in. after shedding; another 10in. before and 12in. after shedding; a third 10½in. before and 11¾in. after shedding; a fourth 10½in. before and 12in. after shedding. Ten-inch lobsters are probably at least five or six years old, but such estimates are only the result of guess-work and may be very far out of the way.

In the United States the only practical attempts that have yet been made toward the artificial propagation of lobsters have been in connection with the so-called "parking" of lobsters—that is to say, their protection in large inclosed natural basins, primarily for the purpose of protecting them for market, and of retaining conveniently at hand at all seasons a large reserve stock. In these parks the young lobsters taken by the fishermen are allowed to attain adult size, the soft-shelled individuals to become hardened, and injuries to be repaired. Under such natural conditions, it is reasonable to suppose that the breeding habits would continue normal, and that large quantities of spawn would be hatched; but whether the young would survive, and increase in sufficient numbers to render the scheme profitable, if carried on for this purpose alone, has not been determined, though none of the projects had been continued long enough to give satisfactory results at last accounts. Two such parks in the United States have been specially called to our attention. The first was established on the coast of Massachusetts in 1872, and was afterward abandoned, though for what reasons we do not know. The second was started in 1879 or 1880 on the coast of Maine, and is, we believe, still in operation.

The latter is a small inclosed bay, with a narrow entrance, through which the passage of all objects above a very small size is prevented by a screen of wire netting. The bay had previously furnished good lobster fishing, and was much resorted to by fishermen. It contains an abundance of food suitable for lobsters, and toward the center has sufficient depth of water with soft bottom, to afford some protection to the lobsters during the colder part of the year. Into this park large quantities of soft-shelled lobsters, of lobsters minus one or both claws, as well as of young individuals under the legal size of 10 or 10½in., have been placed for growth and repair, and it is claimed that the results have been very satisfactory in that particular. At the beginning of cold weather the lobsters retire to the deeper parts of the bay, and at times when the water has been calm and clear, they have been observed almost completely buried in the mud, with only thin feelers, eyes, and a small portion of the front of the carapax exposed. Many of the injured lobsters first placed in the park were females with spawn, and since then berried lobsters have been purposely added from time to time. Young individuals of different sizes were said to have been abundant at last accounts, but in an experiment of this character a considerable lapse of time is required to test its merits. As such parks do not depend for their practical success solely upon the rearing of the young, but rather upon the perfecting of market supplies, which come from the traps in poor condition, it is possible that they may be made to pay if carried on economically. Their effect upon a general increase of supplies would probably never be very great.

So far as we are aware experiments upon the propagation of lobsters in Europe have been confined mainly to Norway and were commenced there in 1873; the first report upon this subject was published in 1875. The berried lobsters were kept in boxes, constructed so as to retain the embryos after hatching. The young remained alive for several weeks and their habits and the causes of their destruction were carefully studied. The results of these experiment will be of great service in the treatment of the young at the Wood's Holl station next summer. Mr. Dannevig's more recent investigations in the same line have been noticed above.

Of great interest in connection with the artificial propagation of lobsters bearing upon the same subject is the question as to whether lobsters can be successfully transplanted from one region to another. This experiment has already been tried two or three times, but so far without success. The transportation of live lobsters long distances, even by railroads, has been accomplished, and they have also been carried from this country to England. Mr. Livingston Stone made three attemps to introduce the east coast lobster on the coast of California; and on the last trial succeeded in planting a number of living individuals near the north of San Francisco Bay. As full accounts of these experiments have already been published by the Fish Commission* we do not need to repeat them here.

The successful transplanting of lobsters must depend upon the new region affording conditions sufficiently like those of the old to favor the growth and reproduction of the species; but the relative conditions of different regions have never been carefully studied with this object in view, and we are to-day unable to state precisely in what manner the Pacific coast waters agree with, or differ from, those of the Atlantic coast. Neither the temperatures nor the specific gravity of the waters of two coasts have been compared, and it is only through incidental experiments that the fact has been ascertained that a few species from each coast are able to live and thrive upon the other. The conditions that are essential to, or control the existence of a species in a new region undoubtedly vary, more or less, according to its organization, and the effects of changes of location upon the higher crustacea have been but little studied, if at all. Above all the new-comer must have the power to sustain itself in the struggle for existence with those forms which already occupy the ground and have been accustomed to it from long habit. Careful studies and experiments in this line of research, with reference to marine forms, would be of great practical benefit to the aims of the Fish Commission and would probably lead to the transplanting of many kinds of marine products to regions which are now poorly supplied with edible forms.

A sort of transplanting of young lobsters has been going on along the New England coast, and especially the southern portion of it, ever since the well-smack lobster trade began. The fact was mentioned above that immense quantities of embryo lobsters appear at the surface of the wells in the carrier smacks during the hatching season, and as the smacks journey along they work out through the holes in the bottom of the well, and are thus constantly adding to the supply of the regions through which the smacks pass. It is unquestionable that the abundance of lobsters on the southern New England coast has been partly kept up, and probably increased at times in the past, by this transplanting of the young, and this fact was noticed and referred to over thirty years ago. The fishermen have the greatest respect for the embryo lobsters that appear in the wells of their smacks, and take great pains that no harm shall come to them.

Numerous accounts have appeared in the newspapers, from time to time since this transplanting occurred, to the effect that many young lobsters, supposed to be the progeny of those brought over by Mr. Stone, had been taken by the fishermen in the vicinity of San Francisco. Careful investigation has failed to substantiate these reports, and the few small lobsters, so-called, that have been referred to naturalists have proved to belong to another related genus, quite common on the California coast, but the species of which never grow to a length of more than 3 or 4in.

FIXTURES.

DOG SHOWS.

Dec. 6 to 8.—Third Annual Dog Show of the Central Berkshire Poultry, Pigeon and Pet Stock Association. W. T. Webster, Secretary, Lee, Mass.

Dec. 14 to 16.—Third Annual Dog Show of the Winsted Kennel Club. Frank D. Hallett, Superintendent, Winsted, Conn. Entries close Dec. 3.

Jan. 23 to 27, 1888.—First Dog Show of the Agusta Pet Stock and Poultry Association, at Agusta, Ga.

Feb. 21 to 24, 1888.—Twelfth Annual Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent.

April 3 to 6.—Fourth Annual Dog Show of the New England Kennel Club, at Boston, Mass. J. W. Newman, Secretary.

FIELD TRIALS.

Nov. 7.—First Annual Field Trials of the Indiana Kennel Club at Bicknel, Ind. Open to dogs owned in Indiana. P. T. Madison, Secretary, Lock Box 4, Indianapolis, Ind. Entries close Oct. 25.

Nov. 7.—Third Annual Field Trials of the Western Field Trials Association. R. C. Van Horn, Secretary, Kansas City, Mo.

Nov. 21.—Ninth Annual Field Trials of the Eastern Field Trials Club, at High Point N. C. W. A. Coster, Secretary, Flatbush, Kings County, N. Y.

December.—First Annual Field Trials of the American Field Trials Club, at Florence, Ala. C. W. Paris, Secretary, Cincinnati, O.

Jan. 10, 1888.—Second Annual Field Trials of the Texas Field Trials Club, at Marshall, Tex. W. L. Thomas, Secretary, Marshall, Tex.

Jan. 16.—Fifth Annual Field Trials of the Pacific Coast Field Trial Club, near Kingsburgh, Cal. N. P. Shelden, Secretary, 320 Sansome street, San Francisco, Cal.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **5492.**

DOG SHOWS IN THE SOUTH.

Editor Forest and Stream:

Never in the history of the South has such interest been manifested as at present in dog shows. Last year the inaugural show was held at Atlanta, Ga., and this winter three shows will be held alone in this State. Atlanta opens early in January, to be followed the next week in Macon, and then the Augusta Pet Stock and Poultry Association of Augusta will hold its first show from Jan. 23 to 27. There are some very fine dogs here, and two regularly organized kennels for breeding.

Among the noted dogs are several imported pointers, several of the Sensation, Beaufort and Graphic strains, one of the celebrated Bravo, and a number of fine native pointers.

There are a goodly number of the Laveracks, by Harry S., of the old Dash II. strain. There are also of the setter family, several of the Gladstones, and native stock on the imported Llewellyns. Also, of the Elcho stock of Irish setters. Of the Scotch collies there is a brace here which we think *par excellence* one of them having been shown but once, and then taking first prize.

We expect our show to be quite successful as an inaugural enterprise, and to attract much stock from abroad as well as near home. We can get up quite a creditable exhibition if only the home stock was shown. J. M. W.

AUGUSTA, Ga., Oct. 15.

EASTERN FIELD TRIALS.

THE coming trials of the Eastern Field Trials Club will undoubtedly prove to be the most interesting as well as the most important yet held in this country. The large number of entries in the several stakes is unprecedented in the history of field trials, and the interest manifested by dog owners throughout the country in the coming meeting speaks well for the management of the Association and is an assurance that the future of field trials in this country is secure so long as they are properly managed. We are advised that on the club grounds quail have never been more plenty, and that they will be fairly well grown when the trials begin. Many of the handlers have already gone South with their dogs and are hard at work preparing them for the contest. T. M. Aldrich, with his string, is at Progress, N. C.; John White, with Tammany, Springbok, Mars, Peach, Dagobert, Birdo and several youngsters, is at his old place, Thomasville, N. C.; S. C. Bradford and J. H. Phelan are at Concord, N. C., with Sachem, Match II., Flash R., Lucia, Queen Bow, Kent Queen, Queen Naso, June, Bob Clifford and several puppies, twenty-two in all. They report an abundance of birds. F. Windholz and J. T. Miller will soon leave for Brown Summit, N. C., with Rockingham, Cora of Wetherall, Princess Phœbus and five youngsters. W. Tallman will also leave this week for Progress, N. C., with Foreman, Royal Albert, Dan Petrel, Foreman's Lass, Galatea, Nelly II., and several youngsters. We have already received the names of several sure winners, but, as they were given in confidence, we cannot divulge them. We regret this enforced silence, as we are sure that our readers would be very much gratified to get a straight tip.

SPANIELS FOR BENCH AND FIELD.

Editor Forest and Stream:

Mr. H. G. Charlesworth, writing in a recent issue of your paper, says he "will not stand quietly by and see two or three inches taken from their (the cockers') bodies and added to their legs." The same writer also says, "We like the long, low, strong-built little fellows such as we breed here, and we think we can produce them of this style," etc.

Without wishing to hurt the feelings of any friends of the cocker I must say that it is very improbable that any man who has seen a typical cocker would suggest taking two or three inches from their length. The cocker spaniel proper is not the long-bodied animal some people would suppose, and to reduce his length two or three inches and add to his length of leg would be to produce a short, tucked-up, stilty-looking brute of the milking stool order. My lamented friend, Mr. Langdale, as good a judge of spaniels as ever went into a ring, said that the cocker is a "small cobby-made spaniel." The word "cobby" is not so elastic as to allow of its being twisted into meaning "long." The cob is not a long-backed horse, neither is a cobby fox-terrier, for instance, one that is long in the back. Mr. Langdale was a horseman as well as a dog man, and nobody knew better than he did the meaning of the word "cobby." There need be no doubt about it that when Langdale said the cocker should be "cobby" he meant it.

I would respectfully ask those gentlemen, who appear to be getting things very badly mixed up on this cocker question, if the best cockers that have been exhibited have been long-backed dogs. Was Dr. Boulton's truly celebrated Rhea a long-backed animal or was she one of the compact and cobby sort? It is fifteen years or more since I first saw that beautiful little bitch at the Birmingham show, but her almost perfect lines still live in my memory. No, gentlemen, she did not bear any resemblance to "crocodiles, weasels or double-action Skyes." She was a charming little bitch, stout, compact, strong in bone, straight in limb, merry and active. She had neither the bandy legs of a Beau, the slab sides of a Brahmin, the poodle coat of a Master Shina, the cut up flanks of a Brant or the snake-like head of a—well, there are a thousand of them, too many to antagonize, and I don't want to get into a fight. Because I and others have awarded prizes to the dogs just named does it follow that we consider them modern cockers or typical cockers? We give the dogs the prizes because we cannot find anything better, not because we consider them typical. Pray do not understand me as wishing to defend my awards or those of others. Some of the most peculiar decisions ever made in this or any other country have been made in the spaniel classes at our shows. I know an exhibitor who took a dog into the ring and was told by the learned judge to "chain him up—no good." Instead of chaining him up the owner took a pair of scissors and clipped all the feather from the dog's legs and belly and then marched him into the ring again to compete in the puppy class. "Good dog," said the judge, and gave him the prize. The learned judge in question is now "special reporter" for a Western paper, and he doesn't forget to tell his readers what he knows about dogs. Just so long as you spaniel men palliate such work by maintaining sphinx-like silence and testify to your belief in the competency of such chaps by entering your dogs to be passed on by them, just so long must you and I expect to find our shows flooded with a lot of worthless brutes of every size and shape imaginable.

Instead of fighting the standard, quibbling in the papers and blaming your dogs for what may easily be traced to yourselves, how would it be for you to ask yourselves the question: How many of us have availed ourselves of the stock at our disposal, and used it intelligently to produce typical dogs? In this question, gentlemen, you will find the secret of your troubles. I have generally noticed that when a man wishes to produce spaniels for the bench, and of course for the field as well, he starts out about in this fashion. The first step taken is to purchase three or four brood bitches, some of which are very long in back, short in head and light in bone, the others short in back, long in head and heavy in bone. The next step is the purchase of a stud dog, this means a dog that has won prizes. No matter whether he be long or short, high or low, light in limb or heavy, snipy or stumpy in head, curly or straight in coat, long or short in ear, good or bad in feet, it is all the same thing, and he is bred to every bitch in the kennel. What is the result? Look down the benches of one of our shows and you will see for yourselves. I do not wish to be personal, but in order to insure myself against contradiction I will ask you how Mr. Rendle, for instance, could ever expect to breed cockers from a dog like Brahmin crossed on all sizes and types of spaniels under the sun? It is impossible; but if it were not so, and a good looking dog should come of such reckless mating, what would the worthless brute be likely to accomplish for posterity? This sort of work is going on right under your eyes, and as a remedy some of you want a new standard and no wonder.

It seems to me that there is a desire on the part of certain owners, who evidently cannot breed typical dogs, to belittle the stock of those men who, by perseverance and greater intelligence, have succeeded in bringing their kennels into prominence. It is the last-named that will eventually succeed in producing the type of dog that Boulton and Langdale loved and prized. Don't blame your judges and don't blame your dogs; there is the blood in this country to produce cockers second to none in the world, but it must not be splashed around in the reckless manner it has been. Newspaper quibbles will not assist you. Mr. Nelles's idea of having measurements taken will do no earthly good, but rather tend to mix matters worse. Study the standard, be sure you know what it calls for, and then go to work—carefully, slowly, intelligently. Select the best qualified judges, and let those exhibitors who cannot breed good dogs take a back seat. Do not alter the standard to fit certain dogs, but fit your dogs to the standard. Which of us can say the standard is defective until we have succeeded in breeding a dog such as the standard calls for? When the dog our standard requires shall have been produced and found wanting in those qualities which all sportsmen insist upon his having, by all means let us revise the standard, and as quickly as possible; but I, for one, as a member of the American Spaniel Club, strongly protest against any tinkering with the standard until I have seen my *beau ideal* of a cocker, and also seen it practically demonstrated that he cannot outwork the milking-stool brigade.

CHARLES H. MASON.

Editor Forest and Stream:

It would be well for Mr. Charlesworth to post himself on spaniels before he attempts to tell us how he is going to breed cockers, for Old Tippo and Toronto Jet were just the opposite style from what he is trying to breed now. Old Tip was a great dog in the field, but he stood 14½in. at the shoulder and Jet over 15in., she was remarkable for nothing except legginess, still I think that a better foundation to build on than the double-action Skye style, because Tip and Jet could work.

THE SHOW COCKER MUST GO.
(He's too long and too low.)

The short-legged cocker can sit on a bench,
And display his fine feather all day;
But he can't hunt grouse nor the royal woodcock,
Because he ain't built that way.

Who told Mr. C. that the sires and grand sires of our best dogs came from England, and how does he know any are good without testing them in the field? I bred prize winners, their sires, grand sires, and great grand sires for many years before Mr. C. was ever heard of as a breeder.

If Mr. C. is "proud of the blood of Beau, and has others of precisely the same style," I am satisfied, but Beau never weighed less than 40lbs. while we owned him, and we were glad to sell him at $50, the price of a pup two months old.

What nonsense to say "we should use a different dog for mixed work, retrieving from water, etc." Why, the cocker was used for all kinds of work before Mr. Charlesworth's grand sire was born, and the dogs did not require a label either, as their action spoke plainly for them. If Mr. C. is not ready to join us in the march of improvement then let him be wedded to his crocodile Skyes, and when we have a field trial for spaniels he will get badly left.

The long body and the short leg,
And the dog that loves the house,
Have had their day and must give way
To the dog that can hunt the grouse.

J. OTIS FELLOWS.

AMERICAN KENNEL REGISTER.

FOLLOWING are the numbers of the dogs entered in the October number of the *American Kennel Register:*

BEAGLES.

5401. Ellis's Victor, W. E. & H. L. Ellis.
5402. Lady Vixen, R. M. Darrach

COLLIES.

5403. Cairo, Tower Grove Collie Kennels.
5404. Clio, J. F. Ryan.
5405. Clipaway, J. Watson.
5406. Collie Joe, J. Collett.
5407. Della Glenlivat, C. Hinckley.
5408. Donald VII., E. Bradbury.
5409. Earl of Warwick, G. Drape.
5410. Fancy Maida, J. DeForest.
5411. Flitaway, J. Watson.
5412. Glen Athol, G. A. Drape.
5413. Glen Cairn, J. Watson.
5414. Glendale, J. Watson.
5415. Glen Rosa, J. Watson.
5416. Glen Ruadh, J. Watson.
5417. Glenwood, J. Watson.
5418. Jack, C. E. Lockwood.
5419. Keeper, Jr., S. B. Roberts.
5420. Lady Eclipse, G. C. White.
5421. Lady Watson, C. Hinckley.
5422. Palmetto, J. T. Wells.
5423. Strephon's Rex, N. B. Reid.
5424. Trifle of Trefoil, H. E. Alvord.
5425. Tunstall, B. W. Lacy.

ITALIAN GREYHOUNDS.

5426. Dandy, D. W. Wing.

MASTIFFS.

5427. Ashmont Suwanee, E. H. Palfrey.
5428. Beau Tibbs, Tiot Kennels.
5429. Bess, H. Falconer.
5430. Chester, W. B. Smith.
5431. Groesbeck's Pluto, H. J. Groesbeck.
5432. Ilford Czarina, H. J. Groesbeck.
5433. Trust, Hugh Falconer.
5434. Vermont Gypsy, G. W. Hoffman.
5435. Wacouta Nap, Wacouta Kennels.

POINTERS.

5436. Beauty L., T. H. Little.
5437. Betsy, Stiver & Comfort.
5438. Bracket II., Floyd Vail.
5439. Bruce III., Alex. Barr.
5440. Clifton Kennels, J. P. Cartwright.
5441. Dark II., E. D. Treadwell.
5442. Devonshire Countess, Barnes Brothers.
5443. Frank M., J. P. Cartwright.
5444. Fred Mac, J. P. Cartwright.
5445. Geo. R. Eager, J. P. Cartwright.
5446. Grenade, W. H. Beasom.
5447. Hairspring, W. F. Gillman.
5448. Joe, James P. Swain.
5449. Lou III., Henry W. Smith.
5450. Nick, James P. Swain.
5451. Nick of the Woods, Barnes Brother.
5452. Shot Croxteth, Ernest M. Bassett.
5453. Topsy, E. D. Treadwell.
5454. Westmoreland Bessie, Barnes Brothers.

PUGS.

5455. Bradford Midget, W. B. Woodward.
5456. Daisy V., A. E. Adams.
5457. Nellie II., Homer S. Bowles.
5458. Pansy Blossom, C. G. Hinckley.
5459. Port, A. E. Adams.

ST. BERNARDS.—ROUGH-COATED.

5460. Barrina, W. H. Dent.
5461. Countess Minnie of Woodstock, Louis A. Congdon.
5462. Czar II., Walter Raynor.
5463. Czarina, Walter Raynor.
5464. Folko II., W. H. Dent.
5465. Gerda, W. H. Dent.
5466. Helen, Dr. C. R. Whitcomb.
5467. Hilda II., W. H. Dent.
5468. King, Weimer & Lincoln.
5469. Nellie Bly, D. Pettigrew.
5470. Prince III., J. I. Geddes.
5471. Prince Hal, J. O. Stevens.
5472. Thora III., W. H. Dent.

SETTERS.—ENGLISH SETTERS.

AMERICAN FIELD TRIAL CLUB.—Cincinnati, O., Oct. 22.—*Editor Forest and Stream:* The following gentlemen have been appointed to judge for the American Field Trial Club: All-Aged Stake, T. M. Brumby, Marietta, Ga.; Harry W. Fuller, Richmond, Va., and John H. Gilbert, Lexington, Ky., with H. M. Markley, of Eaton, Ohio, alternate. For the Derby, H. M. Markley, of Eaton, Ohio, and T. M. Brumby, of Marietta, Ga. The third judge will be announced in the immediate future.—C. W. PARIS, Secretary.

THE STAFFORD DOG SHOW.—Worcester, Oct. 21.—*Editor Forest and Stream:* I notice in your last issue in the account of the Stafford Dog Show that the first prize in heavy weight pointer dogs was given as S. T. Colt's Rob Roy II. This is an error as the first prize was won by the Don Quixote Kennels' Punch. Will you please be kind enough to make this correction, and greatly oblige FRED W. WHITE, Prop., Don Quixote Kennels.

THE EDINBURGH DOG SHOW.

[From the London Field, Sept. 24.]

HAPPILY, northward there has been a brief return of summer weather, which will allow the ingathering of the large quantities of grain which we saw after leaving Beattock Junction. The country on all sides still looked lovely, for the rivers full of water made one dream of trout and salmon, and the moors and rough land, with their varied shades of coloring from golden yellow to the darker chocolate brown caused by the withering bracken and the fast-fading purple heather, made one long for a tramp along the hillsides behind a brace of good pointers or setters. This was not to be, and, speeding onward, the Waverley Market, where the Scottish Kennel Club were holding their eighth show, must be our destination. We have on previous occasions descanted upon the excellencies of this building for a dog show, and exhibitors evidently agree with us, for on the present occasion an entry of 959 was obtained, which will probably be found to form the largest dog show ever held in the Scottish metropolis. The quality, too, was throughout excellent, and with the experience the secretary, Mr. Tennent, has gained, and perhaps the more matured knowledge of management possessed by other members of the committee, exhibitors might be assured that the welfare of the dogs was looked after properly, and the exhibition generally conducted as it ought to be. The benching was done excellently by Messrs. Spratt.

The judging commenced about 10:30 o'clock on Wednesday in four rings in the main building, and this important portion of the proceedings was not concluded until late in the afternoon. The judges were: For pointers, setters, retrievers, and other sporting dogs, Mr. G. Hellewell; St. Bernards, mastiffs, and large breeds generally, Mr. J. F. Smith; fox-terriers and Scotch terriers, and fancy breeds, Mr. L. P. C. Astley; collies, Dr. James; Dandies, Mr. Stordy Carlisle, and Mr. D. Cunningham took the Skye and Clydesdale terriers. The great feature of the show lay undoubtedly in the collies, their uniform excellence throughout being particularly apparent. Dandies, too, were great classes; so were St. Bernard dogs. Setters of all varieties were more than fair, and the Skye and other fancy terriers were likewise strongly represented. Fox-terriers were but moderate, the wire-haired variety especially so.

St. Bernards came the first in the catalogue, and Plinlimmon, looking just as fit and comfortable as he always does nowadays, had about a walk-over in the challenge class; but in the one for open dogs his kennel companion, Burns, was easily defeated by Duke of Marlborough, whom we take to be the better type of the two, and he beat the younger dog in pretty nearly all respects. Burns, who also took the special for the best of his variety under 16 months old, was not in full bloom, though he appears to have improved in head, and Mr. Royle's dog was in nice coat and form. Behind these notabilities came two or three fair second-rate orange and white dogs. Edgar, third prize, with fair markings, a son of Pouf's, is a little curly in coat, which may become still worse, as he is but young; he has a fairly characteristic head, moves nicely, and his bone is good. There was not much to choose between Beauvale and Lord Collingwood, the latter being perhaps better in ribs and body. Raymond, vhc., is too small, and Carl Rosa, the Scotch dog who has done a great deal of winning, did not move so freely as we have seen him, nor does he improve in head and expression; he had only the reserve, but, after the winner, the four animals which followed him were peculiarly close in merit, one excelling in one particular, another in another. Indeed, it seemad a pity that some of the prizes awarded to the bitches could not have been handed to the dogs, for the softer sex were here poor, the winner, Yorke, being far from a good one; her head is too long, and her expression soft and uncharacteristic. Norah, next to her, though badly marked, is the better of the pair. The remainder were not worth a great deal. Nike, an excellent and well-known brindled and white dog, won in the smooth class, while behind him came Rustic, a fawn dog, whose head and general appearance, possibly from his color, denote something of the mastiff cross, though he is in reality a well-bred young dog.

In challenge mastiffs, Victor Hugo looked none the worse for his long journey from Kensington, and justly was placed over Prince of Wales, a dog we have often had a good word for. The open mastiff dog class had St. John, a great, heavily-bodied dog, at its head; his face is not quite the thing, but he moves moderately well, and has excellent bone Rudolph, second prize, has possibly the better head of the two, but his expression is marred by sadly villanous-looking light-colored eyes, and on this account Sultan, who is as good in body as the winner, might have been placed rather higher than third; and Halifax Nero, on the small side, when lying at rest reminded us very much of Earl's picture of the late Miss Aglionby's Wolf. A grand bitch is the brindled Zillah II., who had second prize to Mr. Clarke's young bitch, Queen of Scots, the winner at Barn Elms, and who has improved much in body since that show. Then Lord Nelson beat the beautiful little dog Alliance for the Newfoundland championship, and there was a numerous entry, though poor in quality, in the open division. Waterman had first in dogs, but Bismarck is quite as good in tpye, coat, movement, and head and ears. Norton, too, excelling in coat, style, and head, was shown in good condition, and was as big as any dog in the class. Young Zoe, though her ears are over-sized, was well ahead in the bitch class. Miss Jummy, second prize, is small and out of coat, and Duchess of Aberdeen, who followed her, is too much of the retriever type. A mixed class of puppies included two or three promising St. Bernards that won the money; and the team prize of that variety was won by Mr. Smith with Plinlimmon, Burns, and Rustic, who later on took a similar special for the best team of non-sporting dogs in the show.

A fine big blue dog, Dane, who did not move very well, won in Great Danes, a very much smaller black bitch, in Sheila, coming second.

Triumph, looking, for all the knocking about at shows he has had, very well, won over Hector II. in bloodhounds; the merits of both are well known, and next them on the benches were two couple of good-looking foxhounds from the Linlithgow and Stirlingshire Hunt, not for competition.

The deerhounds, as a group, looked remarkably well on the bench, but off it would scarcely stand pulling to pieces. Dr. Haddon won with Wolf II., a big dog, on the coarse side, but possessing excellent legs and feet, good front, nice shoulders, and strong loins. Buscar II., of similar stamp, had second; while Volthos, an equally good though smaller hound, was third; and Donavoura Bran II., not in such good coat as we have seen him, was fourth; his kennel companion, Ossian, deserved a card, which might have been taken from Gruiam, a bad-headed hound we did not like at all. A fawn bitch, Countess, rather heavy in ears, won in the next class, but Beatrice, though a little shining in her coat, should have beaten her; the latter is a well known winner at Glasgow, Birmingham, and elsewhere, and bears her years gaily. Ebony, second prize, is a smallish blue bitch, wonderfully typical in head and excellent in coat. Brora, fourth prize, is well known; and in Argyle Cissy, third prize, we failed to find much excellence, excepting in her coat and shoulders. The greyhounds were nice classes, well judged, the leading winners all being known on the bench.

In the wavy-coated retrievers, challenge class, Cypress won, a lovely bitch in every particular, and shown in fine condition. In a good class for open dogs, Mask won, a heavy-headed one, straight in jacket, but on the big side for work. The Palace winner, Goldstone, who had won at Warwick also, we preferred; Talisman, who took first at Darlington, now had third. Mr. Whitelaw had all his own way in bitches with three

beauties, though Faith, but hc., with her nice useful size, excellent feet, good coat, and style, we liked as well as anything in the division; Ivy then scored another win; and in the curly-coated division Astley Sultan, a well known winner, unfortunately died on his bench prior to the judging. Black Pearl of Kinnoul, a pretty bitch, good in curl and other particulars, but oversized in ears, was placed at the head of a good class. Our selection would have been Black Prince II., a dog excelling in body, coat, legs, and feet, and style, though the judge put him back on account of his stern, which was carried rather gaily; still he can beat all in the class, this defect thrown in. Gloom is another good dog in body, curl, and other respects, in head being least perfect; Lord Nelson is being overshown, and requires a rest; and Nina perhaps owed the rather more backward position than she is accustomed to to deficiency in bloom.

Naso of Upton beat Nan and Barton Belle in champion pointers, though the latter might have been placed over Nan for the reserve, as showing the more quality. Carlo III., a lemon and white dog, who won at Darlington in 1886, came first now in open dogs, and he is a good-looking one, though he has grown thicker at his shoulders; behind him came Squire of Upton, a leggy, light-eyed dog, who took third; the orange and white Forest King second, and others well known on the show bench. Forest Lilly, a lovely old lemon and white bitch, showing age, and very wide in front, won in her class justly, for those behind her possessed as bad faults as she, and were not as good in other respects, notably Lady Longsdale, third prize, who has very bad feet; Nannie, second prize, who is very low at her shoulders; and Isabel, who is smart and full of quality, but still wide in front, and not nearly so good in head as the winner.

The challenge class for setters was an unusually strong one, containing as it did Count Howard, Belmont, Sir Tatton, Old Sting, Nellie, and Young Rock. There is no denying the fact that the first named was the smartest, gayest, and, on Wednesday at any rate, the best dog in that ring—indeed, we never saw him look so well. Sir Tatton did not move by any means brightly; Sting seems to have gained a new lease of freshness; Nellie, the Irish bitch, was all out of coat; Young Rock has gone all to pieces as a show dog, and we took the Gordon Belmont to be the second best dog in the ring. Mr. Chapman won all the leading prizes in Gordon setters with two and a half brace of beauties, though the winning dog, Heather Boy, is at present thin, flat-sided, and short of muscle behind, though no doubt, when fully developed, he will require an extraordinarily good dog to beat him. On Wednesday, Bang was the better animal of the brace. The open English dog class was chiefly notable for general and uniform excellence rather than for any great merit possessed by any individual. King Mac with his wide front, was lucky to win, and our choice was Saxony, a nice all-round dog, good in every way, and with no really bad feature about him, and about the best legs and feet of any animal in the class. Blue Dash II., a well known dog, was second; and Osman IV., who has gone off considerably, third; while Barton Ranger was quite out of coat. The winning bitch Min, though small and in bad coat, abounds in quality, so she won, with Allie, well known, next, and others not so good further back. The Irish setter dogs were again an equal lot, a son of Frisco, Meddler, winning; he is a fair color and just a fairly average dog. Derry II. showed badly; Robin II., second prize, is almost the counterpart of the winner; and Rash is the rather coarse dog that won at Darlington; Rory is notable for his great length of leg, and he was in thin condition, as was Mr. Wilson's young dog, who is rather too much of the English setter style in all but color to please us. Mischief, the winning bitch, who appeared full of life and go, is sister to the winning dog, and both the other prize winners here have, if we mistake not, previously appeared in prize lists. Solus met and beat Glencairn in challenge spaniels, a division we could not find fault with; but in the Clumber class we did not like Duke V., second prize, who is wide in front, and lacks type; the winner, Keber, was rightly placed, though he is dark in his markings; still his bone, length and style were better than anything else in the group. Clover was second best, though certainly not in show form. A good bitch is the black Belona, and she beat Darkie in all but coat and the latter is not quite nice in her head; Victor has grown too curly in coat. The class for Sussex or liver-colored spaniels was a fairly good one, though Victoria, third prize, appeared to be nearest to the type of the old Rosehill Sussex strain. Two prizes for teams of sporting dogs were won, the one confined to members of the Scottish Kennel Club by Mr. Whitelaw's wonderfully even lot of wavy-coated retrievers, and the open one by Mr. C. H. Beck's three pointers.

The collies, 190 entries, were, as we have already hinted, a remarkably good collection, and Dr. James took infinite pains to place the prizes correctly; and on going carefully over his awards, congratulations on the excellence of his judging may well be given. In the absence of Mr. Panmure Gordon, he awarded all the prizes. The first in the catalogue was the 15-guinea medal offered by Mr. Gordon for the best dog that had never won a first prize at a kennel club show, and owned by a Scotch exhibitor, a member of the Scottish Kennel Club, and this, in an even class, went to a dark sable three-year-old Scotland Yet. He is not a big one, but of a nice working size, good in quality and amount of coat; there is not too much of it, and his legs and feet are capital; his look-out and expression are those of a true collie, and although in the open class he only came third, he is a better dog than either The Scott or Stout, placed over him. The latter is a wonderful animal in the way of coat and frill, but for ordinary purposes as a sheep tender he would be useless, and The Scott, rather of the stamp of Scotland Yet, is not nearly so good in expression. Stout never placed his ears well when he saw him. Mr. Gordon's valuable medal, for the best bitch belonging to a Scotch exhibitor, went to Moonlight, sister to the winner in the dog class. This bitch is one of the best we have seen, excelling in head and ears and feet; her coat is fairly good, and again not too profuse; and she is a big strong bitch, combining both show properties and working characteristics. We do not know whether she has previously won, but have not the slightest doubt she will be at the head of many a class in the future.

The champion collies were nothing particular, but the open dog class was a fine one of twenty-eight entries. The best have already been mentioned, and, after them, Tyneholm, a handsome black and white, with an excellent coat and beautifully intelligent look-out, should have come; indeed, before Stout his place might have been, and he is an old strain which modern crosses are driving out of the land, excepting perhaps where work is required more than actual color. Flock, fourth prize, is an enormous black and tan, often a winner; and though Lord Rosebery, who had the reserve only, is rather curly in coat, his type and character are sufficiently good to counterbalance such a comparatively slight defect. Young Flockmaster is light in eyes and heavy in head, and his sire, though looking well, was quite outclassed. Don Pedro is a nice sable dog on the small side, and the breeding of Clydesdale Trumpet, by The Squire—Bertha, should denote some excellence, which he undoubtedly possesses. He is rather light in bone, and his coat is perhaps a trifle open, but he is another shepherd's dog who looks like being able to gallop around a flock of wild Scotch sheep. In bitches, Moonlight again won, with Coila Lass second; just a fair sort. The puppy Sweet Mermaid next, and followed by Sweet Lassie. Cinderella, now in good coat, a wonderful bitch in many ways, but just lacking galloping appearance, should have had second. In the next class, for dogs that had never won four first prizes and confined to Scotland, Clydesdale Trumpet was placed too low with hc., as was Tweed VIII., another old-fashioned black and white of the proper type throughout. The winners here, as in the corresponding class for bitches, have already been noticed, excepting Gorgie Lily, a nice orange and white bitch, and followed the previous awards. The class for smooths was a fairly good one, the winners being pretty well known, and there were two well-filled classes of puppies, which contained many that had won earlier in the day.

Fox-terriers were numerous enough, but of no great quality, and all those in the challenge classes looked more or less seedy. In the open one for smooth dogs, which had twenty-five entries, Brokenhurst Risk, wearing fairly well, won over Raby Hazard—the latter a terrier we always liked, and one that, we fancy, will not deteriorate with age, as many do. Ebor Jewbilly, third prize, is a common sort, with a long head and fairly straight limbs, but he lacks dash and character. We prefer the white dog Douglas Jester far before him; indeed, the latter ran the two leaders hard. He is narrow in front, has nice bone, is sprightly, and possesses small ears and a good coat; his slight fault lies in some bull-terrier appearance about the skull, which a larger dab of color than that on one ear would take off. Tyneside Lad is a big-eared dog of fair quality; Holmfield Wonder is over-sized and leggy; Ebor Star has a coarse, thick head, and, though a terrier and game-looking enough, he does not possess the class of Pickpocket, who was placed below him. Mr. Scott's two sons of Darkie's are fair terriers, but too full in the cheeks. Richmond Splice, the winner in bitches, is undoubtedly of high class when in form, which she was not on Wednesday; so that she should have been placed down, even out of the prize list; her coat stared, and was rough-haired; her beautiful little ears were never carried straight at all. Still, the class was not a good one. Douglas Bloom, a fair white bitch, was second; a white ticked, rather commonish sort, Inchcape Belle (*sic*) being third; a black-headed, weak-jawed, light-boned bitch, Ebor Enchantress, having fourth. The tan-headed Bridle IV., though rather short in head, was one of the best fox-terrier bitches on the benches, and she should have had third prize; Silhouette, with vhc., has ears like those of a hound—worse we never saw on a fox-terrier. Radical, who won in rough dogs, is a tan-marked puppy, with an excellent coat and a long punishing head; he is good, too, on his leg, but will, we fancy, grow too big, for he is quite size enough now, though but a little over ten months old. Barton Broome, late Darky Broom, who is not so good as once, and Bedford Bob, followed, with more moderate ones still behind. Ebor Wyke, the winning bitch puppy, possesses a nice head, but her body might be transferred to that of a smooth terrier, and no one would dream that it had belonged to a so-called wire-hair. The puppy class awards followed much those that had been made in the all-aged ones, excepting that the winning puppy at Manchester, Richmond Nymph, again scored, and she was far ahead of all her opponents.

Bulldogs are much better than are generally found in Scotland. In dogs, the well-known Rabagas just won from Ginger II., a very good bodied dog, quite heavy enough behind, and not deep or wide enough in bottom jaw. Earl of Haddington is pinched in face and nose, and he is still a bit light in bone and body, but considerably improved since we saw him at Newcastle. Young Baron requires rest, as he is now in poor condition and form. In bitches, Rustic Model, who improves with age, won very easily from Young Rocket, who is plain in head and lacking wrinkle. Priestless is very leggy and plain in face, and therefore should have been beaten by Angus Doddie, who is lower on the leg and much more typical in body; her head is faulty, no doubt, but no more so than the bitch placed over her.

In bull-terriers the winning bitch, Dinah, is fair in body, but has not an extraordinary long head, still it is typical, and she won well from White Chief, whose defects are large eyes and a long back. Khedive we almost liked better, for, although a bit weak in jaw, he has the correct eyes and a better shaped skull, and in body properties he beats his more fortunate rival. Satyr, well-known, is showing age, and has grown very coarse in skull, and lippy. Edinburgh Bob, hc., is moderate, he falls away very much under the eyes, and his skull is wrong in form; he has fair bone and body. Sir Michael II., is too long in back, and his light eye further detracts from his character.

In black and tan terriers, Halifax General, although a bit coarse, was no doubt the best dog in the class; he is, or would be, thickly breeched, but to all appearances part of his hindquarters have been trimmed. Lord Clyde has improved very much since he was at Newcastle: he is not yet quite straight in front, otherwise he is a well built little dog, and there is not much fault with his head, which is both long and typical in form. Old Wallace, who wears very well indeed, was placed third, the reserve going to Emperor, who has a long, well-shaped head, though it lacks substance, and would better grace a dog of 4lbs. less weight. Kenwood Queen, now returned to her wonted form and color, easily secured the head honors in her class, and also the special. Leonora, a well-made bitch, fairly well marked, but a little faded in color, won second. Esmeralda, a small but typical bitch, should have been noticed. Halifax Rose is a bit cheeky, and has open feet; her color is good, and she is well divided in markings. Of white English terriers, White Rose, notwithstanding her plain skull, won well, beating Evol in muzzle, body and bone. Juno is much too large—a remark equally applicable to Diamond, who has a short, thick head.

In the pug dog class, Swagger, who is not good in coat or condition, won, though Loris is, to our mind, better, being larger in skull and neater in ear than his more successful opponent. Stately, a typical-headed one, took third honors; he is deep and square in muzzle, well defined in stop, and has a good-shaped skull; he lacks wrinkle. Lindon, a good-shaped dog, lacking substance before the eyes, held reserve. Halifax Jim is much too large and coarse; and Peter II. possesses a similar fault. Dr. John, with the exception of color, was much the best of Linton's trio. In bitches, Set just won; she has a slight pull in head over Queen Rose, both of which are well known. Laurette, the next best, is pinched in face. The others were outclassed.

In Bedlington terriers, dogs, Taxman, a new blue dog, perfect in size and color, is probably a little better in body than Humbleton Blue Bay, who has a longer and rather more typical head than the winner, whose eyes are placed rather wide apart, and his skull is a little too flat at the base. Judge Day, a large, coarse-headed dog, had no right to beat either Barshaw Piper or Stonehouse Fiddler, both of which are much smaller and more typical. But for his very light eyes, which considerably detract from his character, the liver Cullercoat Lad is quite a nice one. Langside Queen, a fair stamp of bitch, won in her class, but Danley Queen must be considered lucky; she is too large, and her coarse, flat skull should have prevented her beating Vendata, the second best in the class. Border Queen, placed third, was in her right place; she is out of coat just now, otherwise a capital stamp.

In the first class of Irish terriers the cropped Garryford should not have beaten that beautiful bitch Norah Tatters, with her lovely ears and fine expression, especially as the dog is developing, or rather has developed, width of chest with increasing age. In the open dog class some fair quality was forward, and an excellent uncropped dog, Ballyhooley, by Bachelor, from the bitch that should have won in the challenge class, separated Mr. Graham's brace. His coat, head and ears are all good, but, as at present he is only seven months old, he may become too big, and a well-furnished puppy is never a favorite of ours, and this is one. Barney II. is terrierlike; Remotion particularly long and good in head, but not of great excellence elsewhere. And in bitches we were treated to a winning bitch, sheeted; this was Lottery, and, as the dam is said to be Linen, her owner perhaps had a liking to patronize something of the same kind. Graceful and Breda Tiny won rightly enough, and both have recently been critised in these columns. In the puppy division Ballyhooley, mentioned already, scored, and it was pleasing to see Mr. Graham coming second with a fair dog, Breda Czar, who had won third in the open class, and excels in his small, well-carried ears.

These classes of Irish terriers were fairly good, and the Scotch terriers were about the same, though the natives would scarcely care about seeing the leading prizes monopolized by Southern admirers of the breed, especially as an Englishman was the judge. It was no fancy that led us to see a tendency to breed these terriers with long narrow jaws, and some of those that received honorable mention here were far from as varmint-looking as they should be. Dundee was absent, and Ailsa II. had a walk-over in the challenge class; while Highland Chief, who has lost his puppy coat, and is thereby considerably improved since we last saw him, won in open dogs; still he is not quite low enough on his legs, for the Scotch terrier is now required to be as near the ground as the Dandie or Skye terrier. Dumbarton, equally well-known, was second; and Athole, rather too full in the eyes, came next; still the coat of the latter is good. Kildarry, reserve, has nice ears, and we liked him as well as the winner of third prize. Thorn is not straight in front. Many of the dogs in these divisions which had received cards of honor were without them over the benches. Glen Guin, the successful bitch, is a dark-colored one, with a long head and weak jaw, not at all the right type; and Brenda, second prize, is again weak in jaw, and not so good in terrier expression as Glengyle, third prize, whose jacket is too glossy. The reserve, Uddingston Beauty, has a fair coat, but her ears are too big, and she lacks jaw power. Mr. Astley was all astray in the semi prick-eared division, for the best in the class was Blair Athole, a grand one all round, in body, coat, character, ears and other essentials; he got hc. The winner, Dirk, is a very moderate sort, and Young Bon Accord II., third prize, is worse than ever—wide in front, a great white chest, and of no type at all. Glen Leven is a huge, overgrown puppy, with a big, good head; he had second prize, though he was not accorded a card of honor in the open class; Scotia has drop ears, and Cora crooked forelegs. A good puppy won in the young division, and he was claimed at 10 guineas, a brother to Highland Chief coming second to him.

Skye terriers were throughout fair classes, and the awards appeared well made. No great wonder in any of the divisions was forthcoming, and a strange absence of fawn-colored specimens prevailed, hard grays of different shades now being all the fashion; and the drop-eared division was not nearly equal to the prick-eared ones as far as quality was concerned. The Clydesdale or Paisley terrier classes filled fairly well, and the type of this new variety is fairly well established, though Lorne of Paisley is much darker in color, and not nearly so straight in coat, as Bannockburn, first prize, and Nelson, who had second honors.

As usual the Dandie Dinmonts formed one of the great features of the show, but there was nothing present of extraordinary merit that had not been out before, and Mr. Stordy astonished some exhibitors by the way he upset previous decisions. Tweedmouth was in full coat, and had no opponent in the challenge class, and in open dogs the little weak-jawed Otter won, and also took the special for the best Dandie in the show; he is of nice type but too small throughout, and by no means fitted to compete successfully with his namesake. Thorwald, second prize, is of much similar type, low on his legs and with a well-shaped back; and Cracker, third to them, is well known—a fair little dog. Little Pepper, c., the Barn Elms winner, is a grand dog thoughout, bigger than those already mentioned, but by no means oversized; his jaw is strong and powerful and his body well shaped; he is just a little soft in his jacket. Then the reserve went to a bigger dog in Bruce, a very good-headed one, with excellent eyes and a proper coat; but, if he be right, the winners are wrong, for they are not a bit like each other. Hatterick is a nicely shaped dog, with a soft coat; Pincher is tan marked and of a bad type; and Tiger, vhc., appears to be a better dog than ever he was, excepting, of course, his mouth; both Prince John and Lad o' Kyle were worth cards. The bitches were a rather ragged lot, most of them being out of coat. Moray Lass, the successful one, stands on unusually short legs, and evidently being in pup makes this even more apparent; she is fairly typical, but we dared scarcely have selected her for leading honors, which would better have graced Newton Lass II., who, the stronger in jaw, was her equal in body, shape, and a most sprightly looking bitch withal. Village Queen, third prize, was out of coat; Rachel, vhc., looking bleary and Bedlingtonlike about her eyes; and My Mary, the Warwick winner in 1886, was best in the lot had her coat been harder.

The mustards were quite a fair turn-out, the winner being Hero, a dog with a white breast, and certainly not at all the same type as Otter. Heather Sandy was perhaps the best colored dog in the class, and the commended Edenside the best all-round specimen. Heather Peggy, second prize, was in the prize list at the late Kennel Club show in London. The puppies were rather notable for their numbers than their quality, and Sandy III. had a fair win, second going to Fritz II., who had received a simple c. in the open dog class. Several specials were awarded, they being mostly confined to the club and to Scotch exhibitors, Mr. J. Clarke taking that for the best brace, and Dr. Haddon the one for the second best brace of either peppers or mustards.

The toy classes for both terriers and spaniels contained nothing choice after the winners, generally well known; but Mr. Bruce, as usual, showed some beautiful Italian greyhounds. The dachshund class needs no comment, this being a dog the canine Scotchman has evidently no fancy for. The variety class was a poor one, the Pyrenean dog Biloba dividing leading honors with a good black Pomeranian. There were selling and several puppy classes, the latter for litters, the whole of which obtained a good entry; and the exhibition throughout, including the attendance of visitors, and everything else, must be pronounced the most successful ever held under the auspices of the Scottish Kennel Club. The official awards will be found in the November A. K. R.

RETRIEVING WOODCOCK.—*Editor Forest and Stream*: Is there anything disagreeable to a puppy in the taste of a dead woodcock? I have no trouble in making my young dogs retrieve a partridge, but they will only carry a woodcock a short distance without dropping it, or else drag it gingerly along by the head or feet.—C. [Many dogs do not like the taste of a woodcock, and it is only after a number have been killed over them that they take kindly to them. When your dog finds the dead bird walk away from him as though you were unaware that he had found it, and he will probably bring it all right. Reward him with plenty of praise and petting when he brings it and he will soon do the work cheerfully.]

NEW ENGLAND KENNEL CLUB.—*Editor Forest and Stream*: The New England Kennel Club at their last meeting, held Oct. 13, elected the following gentlemen to serve as a bench show committee for 1888: Messrs. F. B. Fay, E. H. Moore, J. W. Newman, Jean Grosvenor, F. M. Curtis and J. H. Long. The first four named were of last year's committee. At the first meeting held by the committee Mr. F. B. Fay was elected chairman, E. H. Moore treasurer and J. W. Newman secretary. It was also decided to hold the next bench show of dogs in Boston, April 3, 4, 5 and 6, 1888.—J. W. NEWMAN, Secretary.

WINSTED DOG SHOW.—*Editor Forest and Stream:* The third annual dog show in connection with the exhibition of the Western Connecticut Poultry Association will be held this year at Winstead, Conn., under the auspices of the Winsted Kennel Club, Dec. 14 to 16. The club has recently organized and applied to the American Kennel Club for admission. The following are the officers: President, Allen H. Norton; Vice-President, G. L. Foskett; Secretary, Frank D. Hallett; Treasurer, Geo. S. Rowe.—FRANK D. HALLETT, Secretary.

DANBURY DOG SHOW AWARDS.—We have received complaints from owners that mistakes occur in the list of awards of the Danbury dog show published in FOREST AND STREAM. It is stated that in English setter dogs, Warwick Kennels' Rock won second instead of Governor. In cocker spaniel bitches, Queen Obo was absent and second was won by Lucy. In bull-terrier dogs, Tony, reported as winning second, was absent. We published the list as sent us, and regret that these mistakes should have occurred.

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Maude M. By Clumber Kennels, Ottawa, Ont., for lemon and white Clumber spaniel bitch, whelped June 11, 1887, by Johnny (Ben—Joan) out of Bessie (Jockey—Romp).

Glenlee. By McEwen & Gibson, Ottawa, Ont., for black, white and tan collie dog, whelped Jan. 1, 1887, by Scotson (Dublin Scot—Flurry) out of Madge (Highlander—Hasty).

PRESENTATIONS.

Nick of Naso—Patti M. whelp. Liver and white pointer bitch, whelped Aug. 8, 1887, by C. M. Munhall, Cleveland, O., to C. K. Munson, same place.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

POCAHONTAS.—Give the bitch an aloes and iron pill morning and evening for a few days.

T.—I am treating my beagle as directed in your paper of Oct. 5. He is already better. How long shall I continue to give Fowler's solution? Ans. Continue for a month from the time you started the medicine. After an intermission of two weeks, commence again.

J. E. C., Bolivar, N. Y.—My setter dog has a sore eye. It first started by water running from the eye, and now it is all raw just like it was scalded, and somewhat swelled. He keeps rubbing it with his paw all the time. Ans. Get the following:

℞ Sodii biborat..... ʒi.
Alumen..... grs. xii.
Glycerin..... ʒiii.
Aq. qs. ad..... ʒvi.
Mix. Sig. Sponge eye three or four times daily.

B. D. N., Baltimore, Md.—Bull-terrier bitch puppy, six months old, about six weeks ago began losing hair on body and legs in spots, size of from one-half inch to an inch in diameter, and where the flesh showed and on the belly and breast the skin was of a brick red color. I used Glover's mange cure, which stopped the hair falling out, and now it seems to be growing; but the red color of the skin remains, and she feels hot to the touch. He nose is moist, and she eats well and is very lively, but she looks thin. Ans. Give Fowler's solution of arsenic in the food morning and evening, four drops at a dose. Continue for a month and stop.

L. A. L., Saylesville, R. I.—I have followed your advice very closely, and as a result, while it has greatly improved the condition of my bitch, yet it has not cured her of having those spasms; indeed, they are more frequent than ever, and I think she now averages two or three a week, though, as a rule, I think they are not severe. She usually has one when she exercises briskly and becomes heated, which is usually when I go hunting. I dislike to trouble you again, but I cannot depend upon her for work unless she is cured; and I have confidence in your ability to improve if not cure her if you will again kindly prescribe. Ans. Follow the same general treatment previously suggested. In addition get the following:

℞ Ferri et strychnin citrat grs. 30, div. in pil. No. 15.
Sig. One three times daily concealed in a morsel of meat.

Rifle and Trap Shooting.

Address all communications to the Forest and Stream Pub. Co.

RANGE AND GALLERY.

THE CHICAGO TOURNAMENT.

CHICAGO, Oct. 17.—The last two competitions on the programme at Camp Sheridan was completed to-day in good order. The first competition was for individual short and mid-range shots, and was a splendid exhibition of rifle shooting. The first prize was won by J. J. Wolford, of the Department of the Missouri team, who made the creditable score of 180 out of a possible 200 at the four ranges. The complete scores are as follows under the conditions:

Open to the world. Any rifle within the rules of Blunt and the National Rifle Association of America. Buffington sights and shade for front sight allowed. Ammunition, any. Military rifles allowed 3 points at each range. Ten shots each man at 200, 10 at 300, 10 at 500 and 10 at 600yds. Position, standing at 200, kneeling or sitting at 300, and any within the rules at 500 and 600yds. First prize, $250 cash and a watch valued at $250; second, $250 cash; third, $125 cash; fourth, $75; fifth, $50 cash.

J C Utter, Chicago	36	32	6	38	100

From the 11 scores marked * 3 points from each range, making a total handicap of 12 points, were deducted for the use of non-military rifles.

In the individual skirmish firing, which is of more military value, the regular army showed up still better, taking six out of the first ten scores and leaving one for each from Massachusetts, Minnesota, Michigan and Maryland. The score of competition No. 5, the last of the programme, was as follows:

Open to the world. Any rifle within the rules of Blunt and the National Rifle Association of America. Other than military rifles handicapped six points. Competitors will start near the 600yd. firing point, and advance until near the 300yd. firing point, when they will retreat to the 600yd. point. In advancing, five halts will be made, and two shots fired at each halt; time allowed, two minutes at each halt. The same rule will be observed during the retreat. Position, any within the rules. Mid-range target used. First prize, $100; second, $75; third, $50; fourth, $40; fifth, $35. The following scores were made, it being possible to score 100 points:

Sergt H Griffith, U S A	91	W M Merrill, Mass	75
M W Bell Mass	91	Lieut A E Chandler, Minn	74
Sergt G N King, U S A	90	W H Wilson, Mass	74

Scores marked * were handicapped 6 points on account of the use of sporting rifles.

ST. PAUL, Minn., Oct. 8.—The third State shoot of the Minnesota National Guard has been in progress at the Fort Snelling range for several days past. Good scores, bad weather and fine soldiery competition have marked the meeting, and to-day Gov. McGill presented the trophies to the winners. The prize winners in the several matches contested during the four days' shooting are as follows:

Skinner Match.

	200	500	600		200	500	600

At the annual meeting of the association officers for the ensuing year were elected as follows: President, Lieut. A. E. Chantler; Vice-President, Capt. Graham, of Wisconsin; Secretary, Capt. C. M. Skinner; Treasurer, Lieut. C. S. Williams.

WILMINGTON, Del., Oct. 17.—Various causes prevented an expected good turn out at the regular weekly shooting on Healdmoor rifle range this afternoon. Those who took part, however, got in full time and some good scores were made. There was a large attendance of visitors to see the sport. The scores are as follows on standard target out of possible 100 points:

At 200yds.

H Simpson	3	8	9	7	8	5	7	9	4	8—69

The Wilmington Rifle Club held its regular weekly shooting at its new range this afternoon. The new range is in "Forty Acres," back of St. Anne's new church, and the members are delighted with their new acquisition. They have been trying to secure a new range for some time, and in view of their success the Schuetzen Park range has been abandoned. The new range is within three minutes' walk of the Middle depot, and will allow shooting at 500yds. The land is high and dry, and is far superior to any range in this vicinity. It has a natural abutment, although an artificial one has been added. There is good light, as the sun will shine on the target all day long. The scores are as follows on standard target, at 200yds. out of a possible 100 points:

First Match.

S J Newman	5	6	9	5	8	9	7	8	7	6—70
C Heinel, Sr	4	7	6	10	8	4	9	5	6	5—64
E M Clark	10	6	9	5	3	5	7	7	5	3—60
J E Newman	4	5	2	4	9	4	3	7	4	10—52
Maiser	5	1	2	3	5	5	7	6	2	6—42
W A Bacon	3	2	4	5	2	5	5	4	4	6—41
C Frederick	8	3	3	2	3	2	2	4	3	6—36
W Mahler	4	1	3	1	0	2	0	2	2	3—18

Second Match.

C Heinel, Sr	8	8	6	8	5	6	6	7	8	5—66
S J Newman	7	9	6	8	5	9	5	5	5	7—66
E M Clark	4	6	6	5	5	5	6	8	5	5—55
W A Bacon	3	4	8	4	4	4	10	5	4	4—50
J E Newman	6	5	5	4	5	5	4	7	6	2—49
C Frederick	4	5	6	3	4	8	1	1	5	9—46

W Capell	50	J Whitesides	53
C Lyons	42	J Walton	50
W Mitchell	42—672	A McPherson	41—610

CINCINNATI, Oct. 11.—Despite the weather, which was the most balking, the A1 Bandle shoot at the Independent Gun Club grounds began at 2 o'clock this afternoon. The opening shoot was at ten single and five pair American clay birds, for the Bandle twin team rings, valued at $50, between H. Hill and J. C. Small, of Aurora, Ind., and P. Nose and W. Small, of Miamitown, Ohio. This was won by the Aurora (Ind.) team, they scoring 37 out of a possible 40 to the Miamitown team's 31. Hill, of the winning team, scored straight.

Match No. 2, at 10 single clay birds, entrance $1, opened with sixteen entries. Nose and Cole divided first money on straight. Bandle and McPhee took second money, and Hill won third alone.

Match No. 3, at same number of birds and entrance, opened with fourteen entries. Nose won first money on straight score. Bandle, Hill, J. C. Small and McPhee divided second money on nine each, and Lark won third alone.

Match No. 4, conditionally, same as No. 3, opened with fifteen entries. Bandle, Lark and Cole tied on ten straight, which was won by Bandle after scoring 19 to Lark's 18 out of 20 in the shoot-off. J. C. Small won second on nine, and Harris, Henry, Murphy and J. Small divided first money on 8 each.

Match No. 5, five birds, 30yds. rise, five ground traps, English rules, entrance $3, opened with twenty-eight entries. First money was won by McPhee, Jackson and Strobel by winning straight. Bandle, Murphy, J. M. G., Shott and Bing divided second money, and Goldrick, Bemis, Nelson, Hill and Jones divided third.

Match No. 6, five live birds, conditions same as previous match, opened with twenty-two entries, but after shooting at three birds each the contestants agreed to withdraw their entrance owing to lack of birds to finish the match. Bandle, Bemis, Murphy, Nose, J. M. G., Hill, McPhee, W. C. H. and Bing had all killed straight at the time the match was called.

Match No. 7, ten single American clay bird, entrance $1, opened with twenty-nine entries. Bandle, Lark, Jackson and Bemis scored nine each, which in the shoot-off was won by Bandle by scoring nine out of ten again. Maynard, in the shoot-off, after scoring eight, won second money by scoring five straight, and J. M. G., after a good shoot-off, won third on seven.

PROFESSOR SMITH.—Newark, N.J., Oct. 23.—*Editor Forest and Stream:* In perusing the columns of your paper from time to time I have seen a few items in regard to rapidity shooting, but have never seen any particular test of 100 or 1,000 shots. I inclose you an account of what I accomplished on Oct. 22 with three repeating rifles ,22cal., distance 30ft. I shot 1,000 shots in 21m. 35s. at a target with a center 1½in. in diameter. Nine-tenths of the shots were inside of a 3in. circle. I would like to hear from some others that are interested in this matter.—PROF. LEVI W. SMITH, Teacher and Practical All-round Shot.

NEW HAVEN, Conn., Oct. 20.—The 2d regiment (C. N. G.) rifle tournament was held at Quinnipiac range to-day. The scores in each team match (200 and 500yds., 7 shots at each target) were as follows: Co. K, Wallingford, 409; Co. E, New Haven, 399; field and staff team, 286; Co. D, 312; Co. I, 309; Co. F, 359; Co. A, 327. The individual match was won by Lieut. Walker, with a score of 32, Lieut. La Barnes second, with 31. The officers match was also won by Lieut. Walker, score 32, Lieut. La Barnes, second, score 31.

NEWARK, N. J., Oct. 22.—Score made by the Our Own Rifle Club, of Newark, N. J., at their last shooting night, Oct. 20: Team 1: Weeks 104, Bertram 100, Kuothe 98, Weider 95, Fred. Freiensehner 106, Steutler 110, Hahn 90, Laute 92, F. A. Freiensehner 109—904. Team 2: Snellen 105, Drexler 92, J. M. Kiefer 100, Condit 98, O. A. Kiefer 106, Bander 88, Kroeplin 94, Bayer 101, Willms 103—887.

THE TRAP.

Scores for publication should be made out on the printed blanks prepared by the Forest and Stream, and furnished gratis to club secretaries. Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

CLEVELAND, Oct. 20.—There was a fair attendance at the regular shoot of the East End Gun Club at Blue Rock Springs this afternoon. The sky darkened early in the afternoon and very good shooting was therefore not expected, although the members spent an enjoyable afternoon at the sport and some of them made good scores. The targets used were blue rock pigeons. C. C. Hogan won the first badge with a score of 18 at 18yds. rise and D. Auld won the second badge with a score of 17 at 18yds. rise. It was the second shot of the club under the handicap rules and the change from class shooting meets the approval of all the members. The usual team shoot which followed the badge shoot was at live birds. The match was not close enough to be very exciting. Stoneman and Dr. Craft were visitors at the shoot. The score is as follows:

The Badge Shoot.

A B Jones	0101111001010100111—12	Calhoun	1100101101101001111—13

NEW BEDFORD, Oct. 18.—The Acushnet Gun Club shot to-day for the last time this season at its grounds in Acushnet. The members expected to meet the New Bedford Gun Club once more before the season is closed, but the latter seemed to hold off. To-day's scores are given below. Twenty birds apiece were allowed. The first ten against each marksman represents clays and the next ten bats:

C A Gray	0110111110 1111111111—17

BOSTON, Oct. 19.—There was a fair attendance of shotgun men engaged in shooting for prizes at Walnut Hill to-day. Snow won the gold Macomber badge and Smith headed the list of prize winners in the merchandise match. E. J. Neal secured first prize in the visitor's part of the latter match. Appended are the names of the winners in the sweepstakes event. Six clay-pigeons, Adams first, Smith second, Stanton third; 6 clay-pigeons, Nichols first, Adams and Stanton second, Jones and Warren third; 6 Macomber birds, Stanton and Snow first, Nichols and Adams second, Smith third; 10 Macombers (badge sweep), Adams first, Snow second, Warren and Jones third: 5 pairs Macombers (badge sweep), Snow first, Nichols second, Stanton third; 10 clay-pigeons (merchandise sweep), Smith first, Warren second, Stanton and Snow third; 5 pairs bats (merchandise sweep), Warren first, Smith second, Adams and Nichols third. Walkup match—Three pairs clays, Smith first, Neale second, Warren third; 6 clay-pigeons, straightaway, 35yds., Stanton first, Smith and Nichols second, Neale and Snow third; 5 clay-pigeons (Arkenson match), Nichols and Adams first, Smith second, Neale and Stanton third; 5 clays straightaway, Nichols first, Stanton and Snow second, Warren and Neale third; 6 clay-pigeons, Stanton and Nichols first, Snow second, Smith third; 5 bats, Stanton and Smith first, Snow second, Adams third; 6 bats, Stanton first, Adams and Nichols second, Neale third; 6 clay-pigeons, Stanton first, Snow second, Warren third; 6 clays, straightaway, Stanton first, Snow second, Warren third. Macomber badge match—Snow, singles 8, doubles 9, total 17; Nichols 8, 8, 16; Adams 9, 6, 15; Stanton 8, 6, 14; Smith 8, 6, 14; Warren 5, 3, 8. Merchandise match—Smith, singles 10, doubles 8, total 18; Warren 8, 9, 17; Stanton 7, 8, 15; Snow 7, 6, 13; Jones 5, 8, 13; Adams 5, 7, 12; Nichols 5, 7, 12.

WELLINGTON, Oct. 22.—The wind made shooting rather difficult this afternoon, yet Perry scored one point for first in the Merchandise match, Sanborn, Gerry and Snow a point each for second, and Bradstreet one for third. The other events were won as follows: 10 pigeons Sanborn, 10 blackbirds Gerry, 6 blackbirds Gerry, 6 pigeons Snow, 6 blue rocks Gerry, 6 pigeons Gerry, 6 blue rocks Snow, 6 blue rocks, Snow, Dan and Adams, 6 pigeons Pratt, 6 blackbirds Gerry, 6 pigeons Warren, 6 blackbirds Snow and Perry. There will be a tournament of the Wellington Gun Club at the range, Oct. 27, shooting to begin at 10 A. M. The leading contest will be for the Climax diamond badge now held by H. G. Wheeler.

PIQUA, O., Oct. 14.—Dr. Hyde was declared the winner of the gold medal at the Gun Club shoot here, beating in the final shoot Racine and Vogt, who were in a tie with him. The contest was a 25 bird match, 5 traps, 14yds. rise. Dr. R. L. Hyde broke 20, Ed Racine 20, C. H. Vogt 20, John Franz 17, Aug. Schneyer 14, John Long 14 and A. B. Vandervecr 14. Hyde wears the medal until his score is beaten.

MISS ANNIE OAKLEY shot a match Sept. 30, at Nunhead, Eng., at 50 blue rocks, 5 traps, 25yds. rise, Hurlingham rules, using a 20-bore gun, 3¼oz. shot. She scored 41 out of the 50.

Canoeing.

Address all communications to the Forest and Stream Pub. Co.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signal, etc., of their clubs, and also notices in advance of meetings and races, and report of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

NOVEMBER.

6. Oakland, Edwards Cup.

DECEMBER.

4. Oakland, Edwards Cup.

AMERICAN CANOE ASSOCIATION.

OFFICERS, 1886-87.

Commodore: R. J. WILKIN, Brooklyn, N. Y.
Secretary-Treasurer: WM. M. CARTER, Trenton, N. J.

OFFICERS-ELECT 1887-88.

Commodore: R. W. GIBSON, } Albany, N. Y.
Secretary-Treasurer: F. L. MIX, }
Vice-Com. *Rear-Com.* *Purser.*
Central Div. Henry Stanton R. W. Bailey E.W. Brown, 146 B'way, N.Y.
Eastern Div. L. Q. Jones Geo. M. Barney W. B. Davidson, Hartford.
N'thern Div. A. D. T. McGachen. W. G. McKendrick. S. Britton, Lindsay, Can.

Applications for membership must be made to division pursers, accompanied by the recommendation of an active member and the sum of $2.00 for entrance fee and dues for current year ($1.00). Every member attending the general A. C. A. camp shall pay $1.00 for camp expenses. Application sent to the Sec'y-Treas. will be forwarded by him to the proper Division.

Persons residing in the Central Division wishing to become members of the A. C. A. will be furnished with printed forms of application by addressing the Purser.

CANOEING AT DUBUQUE.—Beside their regular weekly trips the members of the Dubuque C. C. made a cruise of 183 miles on Decoration Day. The club is now incorporated in the new Dubuque Boating Association, which will build a $3,000 club house this winter. The club now numbers 140 active members.

CANOEING AT FALL RIVER.—The Massasoit C. C., of Fall River, Mass., was organized on Oct. 17, with the following officers: Com., Nathan C. Drool; Vice-Com., J. B. Richards; Rear-Com., Howard Jackson; Sec. and Treas., Wm. O. Anthony, 142 North Main street.

NOTUS SAIL PLAN.—The height of mizenmast should be 11ft. 4in., not 6ft. 4in., as given last week.

THE EXECUTIVE COMMITTEE MEETING.

THE amendments to the constitution given herewith will be presented at the meeting of the executive committee, which will be held in Albany on Nov. 12. The two weeks which intervene will give time for a discussion and explanation of the various points involved through the columns of the FOREST AND STREAM, and we hope to hear fully from canoeists before our next issue. By this means every member, though unable to attend the meetings, may have a voice in the legislation of the A. C. A., though there are few, we are sorry to say, who avail themselves of the privilege. The proposed changes are all for the purpose of strengthening and improving the Association, and the officers who are actively engaged should receive the aid of all members to the extent of a careful criticism of all proposed measures and the suggestion of any possible improvement. The main question of the meeting will be that of next year's meet, where it will be held. In this all are interested, and as a decision must be made at the meeting now is the time for suggestions and criticism, not after the matter has been finally settled. As the Eastern Division has declined to hold the meet this year, as they were entitled to, it remains in the Central Division again. A number of sites have been mentioned, some very good, but none possesses such an evident superiority that it can at once be decided on, and the question will no doubt be thoroughly discussed in the meeting before a decision is reached. The St. Lawrence, Lake George, Shinnecock and Peconic Bays, Lake Champlain and the lakes of central New York have all been proposed, the choice at present being in favor of Lake George. The committee will be glad to hear of eligible sites and to have all possible information concerning them, as well as the ones mentioned above. We hope to hear from those who are interested in the meet, and our columns are open to them for suggestions and a discussion of the subject.

To the Members of the A. C. A.:

GENTLEMEN—Pursuant to the provisions of Article XI. of the Constitution, which requires that proposed amendments to the Constitution be published in general terms in the official organ two weeks before they can be submitted to the Executive Committee, the undersigned gives notice that at the Executive Committee meeting to be held in November, 1887, he will move that the Constitution be amended in the following particulars, viz.:

I. That the provision in Section 2 of Article V., that the Commodore and Secretary-Treasurer shall hold office for one year from the first day of November following their election, or until their successors are elected, be amended by providing that if they are elected before the first day of November following the camp, they shall hold office for one year from said first day of November, or until their successors are elected; but if elected after said first day of November they shall hold office from the time of their election to the first day of the following November, or until their successors are elected.

The point of this proposed amendment is, that as the Constitution now reads, if the Commodore for any reason should not be elected at the camp he could be elected at the Executive Committee meeting in November, and if elected in November, the present provision of the Constitution might bear the construction that he would hold office for one year from the 1st of November following, in other words, for two years.

II. That Section 1 of Article VI. be amended by striking out the provision that the Executive Committee at its meeting held at the A. C. A. camp shall determine the locality of the next A. C. A. camp, and by inserting instead thereof a provision that the locality of the next A. C. A. camp, each year, shall be determined by the Executive Committee at it annual meeting in November.

III. That the provision in Section 2 of Article V., that the Commodore shall be elected from each division in turn, and that the A. C. A. meet shall be held within the territory of the several divisions in turn, be repealed.

IV. That Article VII. be amended by striking from the list of the duties of the Commodore the provision that he shall pass on the qualification of names whenever published for membership, and by inserting a provision that he shall pass upon appeals from the decisions of the Vice-Commodores, and by inserting at the end of Article IX. a provision that any member feeling aggrieved by any decision or a Vice-Commodore upon the subject of admission to membership, may appeal to the Commodore.

V. That Article XI. be amended by providing that the Constitution may be amended by a vote of two-thirds of the members present at a meeting of the Executive Committee or by a writing signed by the Commodore and two-thirds of the members of the Executive Committee, provided the proposed amendments be published as provided in the Article.

VI. That a new article be inserted in the Constitution as follows, viz.:

Article —. The ex-Commodores of the A.C.A., so long as they are members of the A. C. A., in good standing, shall have the right to attend meetings of the Executive Committee, and when attending and present at such meetings shall have all the rights of, and for the time being be, members of that Committee.

VII. That a new article be inserted in the Constitution as follows, viz.:

Article —. Any officer of the Association may be removed from office, and any member of the Association may be expelled from the Association by the Executive Committee, for cause, in the manner to be prescribed in the By-Laws and after having had an opportunity to be heard.

Very respectfully,
HENRY STANTON.

NEW YORK, Oct. 21.

MY PARTNER GETS TIPPED OUT.

IT was the frisky canoe that gave my partner the tip. In canoeing, some, if not all, pass through phases of feeling something like this. If the very first venture is successful there is a liability to over-confidence and consequent carelessness. A canoe is sensitive and will not put up with any indifference to its claims for affectionate attention. Hence in an unguarded moment it reminds its human freight that it is a very agile craft and exceedingly slippery on the bottom. The result is a wet and humble man. There follows a stage of timidity and extra carefulness, when the canoeman does not stand up any more to cast his flies, and feels like parting his hair in the middle when he sits down. With practice, however, he soon emerges from this into a comfortable state of both confidence and carefulness.

My partner was a thorough novice in canoeing and was highly pleased, as every sensible man must be, with the bird-like qualities of the canoe. He was also delighted with its steadiness and general good behavior, and wondered at reports he had heard of the crankiness of such craft, not perceiving that I was balancing and looking out for him all the time. I told him a canoe was good enough and safe enough, only a man must be properly careful and be careful all the time. It would not do for him to take a vacation and go sitting on the gunwale. I could see that my admonitions had little effect, but I chuckled to myself and bided my time. I knew his time would come.

We left Kinco one afternoon, paddled north about ten miles and into Duck Cove at the head of which we were to camp that night. As soon as we touched shore I struck into the woods to locate a road we wanted to use next day to reach Duck Pond. When I returned to the landing I found the wettest man I had seen since leaving home. He had undertaken to unload the canoe. He lifted a bundle, gave a mighty heave, when the canoe like a live thing greased and in a tremendous hurry, went from under him in a wink's time, and he was lying down all under in 18in. of water. It surprised my partner a good deal. Before that he did not know a canoe was so sudden. It also for a time seriously damaged his good feelings and confidence. The affair was rather unheroic and I credit myself with phenomenal self-control for not making game of him, which I did not. For a few days he was in the timid stage, but by natural development soon came to the ease and address of a well-regulated canoeman. But that overturn did him a power of good.

PITTSFIELD.

A SPRING MEET ON NEWARK BAY.

THE following notice explains itself. The camp this year was very badly located, and the proposed site will be far better, though it has some serious objections. Nothing has yet been done toward a local meet about New York and the Hudson, but it might be well to unite in a meet with the Passaic canoeists. Newark Bay is near New York, the ground and water are good for camping and racing, the only objection being the beach. Many upriver canoeists would be glad to come down, and a very large meet is probable:

Editor Forest and Stream:

The Passaic river canoeists propose to make the meet on that river a permanent fixture. For that purpose a committee composed of members from the different clubs on the river, have already met and selected a site for the camp.

The meet next year will be held on Newark Bay. In holding it there it is expected that a greater number of New York and Brooklyn canoeists will attend, a better course can be obtained, and the mosquitoes—well, they couldn't be much worse than at Dundee. A date has not yet been settled, and probably will not until early next spring.

RICHARD HOBART.

59 HALSEY STREET, Newark, N. J.

THROUGH THE WYOMING VALLEY.

CANOEING, although a sport that is still young—in its infancy, in fact—is making rapid strides forward. There is a charm about these dainty little boats that no other craft possesses. They are so light and graceful. The slightest touch of the paddle seems to endow them with life and send them flying over the water. It is a fascinating sport, and those who enjoy it are not few. The approach of summer heralds the opening of the canoeing season and witnesses the departure of many canoe clubs on their annual tour. The St. Lawrence, with its tempting rapids and thousand isles, is a favorite resort, while the lakes and rivers of northern Maine possess charms for some. But there are numerous other beautiful streams which present to the canoeist attractions almost as great.

In the summer of 1886 three of us came down the north branch of the Susquehanna. We each had a canvas canoe and carried a complete outfit. We started in at Towanda, which point we reached by rail. Our first camp was on an island a mile below, where we pitched our tent beside a canoe club from Philadelphia. They had started at Cooperstown on the lake which gives birth to the Susquehanna.

Our experience the first night was rather trying. A violent storm came up about 10 o'clock, and, after excavating a small canal under our tent, the rain loosened the stakes and down came tent and all. We crawled out into the black darkness and pouring rain. Our new acquaintances, who with wisdom aforethought had made themselves secure, were powerless to help us, as their tent was already packed to its utmost capacity. The prospect of spending six hours in the rain stared us gloomily in the face, and there seemed to be no other alternative.

Our courage was at its lowest ebb, when some one called out from the tent: "Why don't you fellows go over to that old house?" Our spirits rose on the instant. We had noticed on landing a deserted house across the island, but had never given it another thought.

With difficulty we lighted a lantern, and after splashing through small lakes and wading ankle deep in mud, we were fortunate enough to strike the house. An inspection of its one room brought to light an old bedstead, two or three broken chairs, and a large seine. The place was evidently frequented by fishing parties. With the aid of an old box we soon had a roaring blaze on the fireplace, and in the course of an hour we were fairly dry again.

At dawn the clouds broke, and with the promise of fair weather before us we left our retreat and prepared breakfast. We found our canoes all right, with the exception of a little rain which had penetrated the canvas covering. The other party intended to remain in camp here a few days. They gathered on the bank to see us off, and amid a chorus of good wishes we paddled out into the stream. We struck a strong current and were soon carried out of sight of our first camp.

For the first eighty miles of our trip the river flowed in a serpentine course through Bradford county, thence into Wyoming county and through the whole length of the lower Wyoming Valley, which Campbell has gifted with more than historical interest, by his beautiful poem "Gertrude of Wyoming."

The scenery was grand and of such a varied nature as to excite our highest admiration. Wild and rugged mountains gave place to gently sloping fields and forest, dotted here and there with farm houses or perhaps some pretty village nestling in among the hills. Frequently a thicker cluster of trees than usual, and the distant sound of falling water, marked the spot where some mountain stream mingled with the river. Sometimes the resonant peal of the ferryman's bell, which called him to his post, awoke the echoes. We ran across these sleepy old boats every few miles. Some of them were in the last stages of decay, and appeared ready to sink at any moment. One day, while paddling backward watching a trolling spoon I had thrown out, I ran into one broadside. I was considerably shaken up, but the copper plate bow saved the canoe from injury.

Every place we stopped seemed to be connected in some way with the early history of the country. "Here was the spot," one old farmer told us, "where Sullivan's army had encamped." Another pointed out the place where a battle had been fought, and showed us a couple of old skulls and tomahawks he had ploughed up at different times. Nor are the present occupants of the Wyoming valley ignorant of the horrible scenes of bloodshed and cruelty which were enacted there in 1778. Many of them are household traditions to which we listened with great interest, and at night when we had pitched our tent along the mountain and gathered around the camp-fire, our imaginations used to run riot with us until we fancied we could hear the shriek of the savage echoing through the valley.

The first day from Towanda we lunched at Standing Stone, not the so-called village, but the stone itself, two miles below, which at a distance presents a very striking appearance. It is a huge slab, rising thirty or forty feet in the air. It stands just at the foot of a steep mountain, partly on land and partly in the water, and has stood there for centuries. One side of it reflects in rude carving and paint the names of many who have paid it a visit. The dates run back many years. One ambitious person, filled perhaps with the spirit of George Washington, has outstripped all his competitors, and placed his name three feet above them all.

The river pursues a very crooked course, and is wide and sluggish at some places, at others swift and narrow. You paddle idly along through deep, calm water. The river is wide and you hardly realize that you are moving. But almost imperceptibly the current has become swifter, and a distant roar strikes your ear. And now away below you a line of white foam appears, glittering in the sunlight. The river is getting narrow and the shores seem to be closing in. You are moving so rapidly that the bottom appears to be flying from under you, and suddenly you dash into a mass of foam and spray, splashing waves and black rocks, that rise up around you like grim spectres. You dart recklessly on, just missing that sharp rock, scraping your keel on another, and cleaving a path through waves that threaten to submerge you. The worst is over, and before you realize that you are safely through, the swift current has whirled you round a bend, the river widens again, and you are floating calmly along, with the distant roar of the falls still ringing in your ears. A few miles further and you repeat the experience. The rapids are numerous, but, as a rule, are not dangerous. We were very fortunate in meeting with few mishaps, though we had some very narrow escapes. On approaching rapids no opportunity was afforded us of picking a channel, as the swift current always carried us right into them at breakneck speed.

We usually avoided the heat of the day by making an early start, paddling until the sun was well up, and stopping off until the afternoon.

At daybreak the river seemed to be alive with bass, leaping out of water and dashing themselves almost on shore in reckless pursuit of small fish. We caught a great many by trolling as we floated along. Black bass and yellow perch were very plentiful and once in a while we were fortunate enough to get a salmon. Yellow perch are very gamy fish, and we had a great deal of sport catching them. They frequent deep spots along shore where patches of grass and weeds grow in the water. They bit voraciously and struggled so hard that we invariably thought we had hooked much larger fish. Most of them were about the size of large sunfish, but we caught a couple of splendid fellows that must have weighed a pound and a half apiece. After leaving the Wyoming Valley they disappeared, and we did not catch another one.

Starting out early in the afternoon we would travel until 5 or 6 o'clock, and then camp for the night, picking out some grassy spot with a spring close by if possible.

One night darkness overtook us before we could find a suitable camping place. On one side the mountain sloped abruptly into the water. The other shore was simply a gravel bed extending from the river some yards back to a tangled thicket of young trees and dense undergrowth. We chose the gravel bed, and as it was impossible to drive stakes through the rocky soil, we stretched our tent over two canoes and slept on the pebbles. Our dreams that night rather resembled nightmare, and morning found us fully convinced that some of the pebbles had penetrated us, an impression which a plunge in the cool depths of the river could scarce eradicate. We were very careful after that to avoid a similar experience.

We would have remained longer in the lovely Wyoming Valley, but the greater part of our journey still lay before us. We had spent a few days at Skinner's Eddy where we found the fishing the best along the river, and had camped a while near Tunkhannock, and now we were near the end of the Valley. Late one afternoon, we rounded a bend in the river and saw below us Pittston with its smokestacks and huge coal breakers. We did not stop, but passed by the city and camped that night on an island a mile below.

The following day we made an early start, and stopped at the Wyoming monument which marks the scene of the dreadful massacre. Many of the victims are buried under it though some lie in Forty Fort cemetery, which is about two miles below. Near the cemetery, and right on the bank of the river, a flagstaff marks the site of old Forty Fort. The last trace of the fortification disappeared a few years ago. We wandered over the ground, and after diligent search picked up a couple of flint arrow heads and part of a tomahawk. At noon we reached Wilkesbarre.

We stayed here until late in the afternoon, and then to avoid the nine miles of back water from the Nanticoke dam, we put our canoes on the deck of a steamboat and went down to Nanticoke. The boat touched half way at Plymouth, which was still suffering from the epidemic. We were very careful to drink no river water in that vicinity. That night we camped along the river near Nanticoke.

A regular vendetta appears to exist between canal boatmen and the miners here. We went into the town a while but our stay was short. The English language actually seemed to be at a discount here. The streets were thronged with Poles, Russians, Hungarians, Italians, and various other nationalities. Every other house appeared to be a saloon. On our way back to camp we got sandwiched in between a number of boatmen and a pursuing party of miners. As neutrals we were allowed to withdraw, and we had hardly reached camp when we heard the sounds of conflict behind us. The next day we took our canoes around the dam via the canal, as the chute was closed.

We had a stiff up-stream breeze that day which prevented us from getting any further than Shickshinny. The following day, which was Saturday, we reached Berwick about 12 o'clock.

The river just below seemed to be a mass of rapids. We were warned not to attempt to go through them. Several persons told us they were impassable and advised us to carry our canoes around. But with recklessness born of self-confidence we determined to trust to our usual good fortune to carry us through in safety.

At the very beginning my canoe struck a rock and was instantly turned broadside and whirled over and over. I was hurled out, and grasping the canoe I with difficulty succeeded in reaching shore, half swimming, half wading through the furious water. My companions seeing what lay before them had jumped out and reached the shore as best they could. I found the keel torn nearly off of my canoe, and the afternoon was consumed in drying off and making repairs. We finally got off about 4 o'clock, and with the aid of a swift current we soon paddled down five miles and stopped to spend Sunday near Creecy. We were fortunate in finding a beautiful spot to camp with a spring of ice cold water pouring out of the ground right beside our tent.

We left here Monday morning, and passing Bloomsburg and Rupert, we soon reached Catawissa. Toward evening we passed Danville and camped a mile below.

The next day was the hottest of the season. The extreme heat combined with an up wind so retarded our progress that it was nearly sundown when we reached Sunbury and paddled out into the waters of the main river. We struck across and pitched our camp at Shamokin Dam. While preparing supper we were surprised by a visit from a friend who was spending a few days here for the fishing. He dropped down on us with a box of cigars and a package of papers containing home news. He was as welcome as the flowers in spring, for his was the first familiar face we had seen.

This was Tuesday night; we pushed straight on all day Wednesday, passing through a great deal of rough water, but fortunately without any serious accident. At noon on Thursday we passed through the beautiful Kittatinny Gap at Rockville, and entered on familiar water again. We stopped on an island where we had often camped, for general repairs, throwing away our useless articles, and packing up all our baggage.

About 4 o'clock we floated round a bend and Harrisburg lay before us, the dome of the Capitol glittering in the rays of the setting sun, as if bidding us a welcome back to the trammels of civilized life again.

We had derived an immense amount of enjoyment from our trip, and, with a view to the future, had made ourselves well acquainted with the river. The approach of summer will no doubt find us preparing for another canoe trip, and inclined to exclaim with the poet:

> Bring us the air of hills and forests,
> The sweet aroma of birch and pine;
> Give us a waft of the north wind, laden
> With sweetbrier odors and breath of kine.
>
> W. M. GRAYDON.

A SNEAKBOX ON THE POTOMAC.

I HAVE just finished reading "Seneca's" article in the FOREST AND STREAM of this date (Oct. 20), and aside from the pleasure it gives me to read one of the dear old fellow's breezy articles, I appreciated it more because a recent experience of mine in another fellow's "box" has verified to my mind nearly everything he says about the comfort and convenience of the style of boat he advocates.

I have long thought that it was about the sort of craft that would suit me, but as I had never seen one I hesitated about buying, fearful that after all I might get something that I wouldn't like. You see I'm a Benedict, and wish to share my pleasures with my wife and babies, and a canoe can hardly be considered just the thing for that purpose. Besides, when you've piled all the stuff that "Seneca" mentions into a canoe of the A C. A. dimensions, you are inclined to the opinion that you had better take along another canoe for yourself.

Canoes are jolly things for a race or a paddle, but when it comes to a cruise you will generally find some big-hearted and big-boated fellow taking along a good deal of the duffle necessary to the comfort of the boys in the smaller boats. At least that has been my experience and observation on the few cruises that I've made. On the 3d of this month our club inaugurated a week's meet some fifteen miles down the river, at a beautiful spot near the home of the immortal George. On the morning of that day six boats with a man in each left the club house at Georgetown for the chosen spot. One of them was a large canoe, almost a yawl. Another was a racing machine, with room in her cockpit for an immense centerboard trunk and a small portion of the anatomy of her skipper. Three others were canoes of the conventional type, and the remaining one was a sneakbox.

It is safe to say that the "Sneaky" as the boys called her, carried as much of a load as any three of the others put together. Added to that she was soon forced to take on board the occupant of one of the canoes, who couldn't sail, and to tow his heavily laden boat in the bargain. The consequence was that she reached camp about an hour after the others, but during the trip her crew were able to move about, stretch out, prepare for a meet, and do divers and sundry other things that couldn't have been accomplished in a canoe without imminent risk of a bath.

We were in camp a week, during which time the Sneaky was in almost constant requisition by the boys who would go duckling, or rowing, or sailing, or take out some visitors or something else for which their canoes were unsuited. During that week I was never once worried about her getting bumped or scratched or left ashore with the tide, or anything else, while the others were constantly going down to the landing at all times of the night and day to see about their boats.

One day after returning after an early ducking trip, and while I was at breakfast, three of the boys quietly sneaked down to the Sneaky, and went out for a sail. After finishing my breakfast I started down to the landing when I found one of the liveliest little southeast gales "a-blowin'" that I ever met with. I was told about the boys and the Sneaky, and must confess to a little apprehension, for I didn't know what she could stand. There were only two sails in sight and they were both under double reef, and were too large at that for the sneakbox.

For an hour I scanned the river without seeing anything of her, but at the end of that time I saw her coming around Mt. Vernon wharf under a "spruce breeze." The boys came in jolly and wet, said that they had found a heavy sea on outside in the channel, and while all three were seated on the weather deck holding on to the boom (just to try her), the boom snapped and they came near going over. For a moment I wished they had. Think of three stout young fellows holding a small spar not 2in. in diameter. No wonder it snapped. However, they came off with no worse damage than a broken boom and the loss of the rudder, which became unshipped in the heavy sea. They had a wholesome regard for Old Sneaky after that, as not one of their boats could have stood up in that blow.

Well, to make a long story short, she was the most useful boat at the meet during the entire week, and at the end of it I rowed her thirteen miles (I sailed two when the wind died out) heavily loaded, and with a loaded canoe astern, and felt no ill effects from it afterward. She was as easy a rowing boat as I want to handle for a long pull, and barring one other canoeist who paddled light, I was the only one of those who started that day to reach our boat house that night.

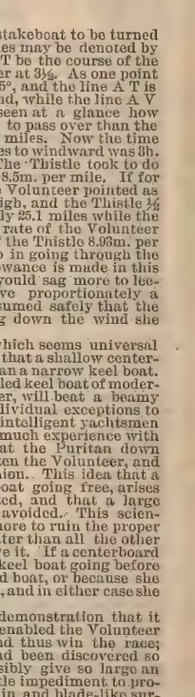
I shall be glad to once more follow in the footsteps of the father of canoeing in these waters, "Seneca," who can do anything but roast a pig, and if I don't have a cruiser by next summer, it won't be for lack of determination.

SKIPPER.

WASHINGTON, D. C.

IANTHE C. C.—On election day many of the Passaic River canoeists will gather in the neighborhood of the Ianthe C. C. house to take part in a series of scrub races for prizes offered by different members of the club.—IDLEMERE.

Yachting.



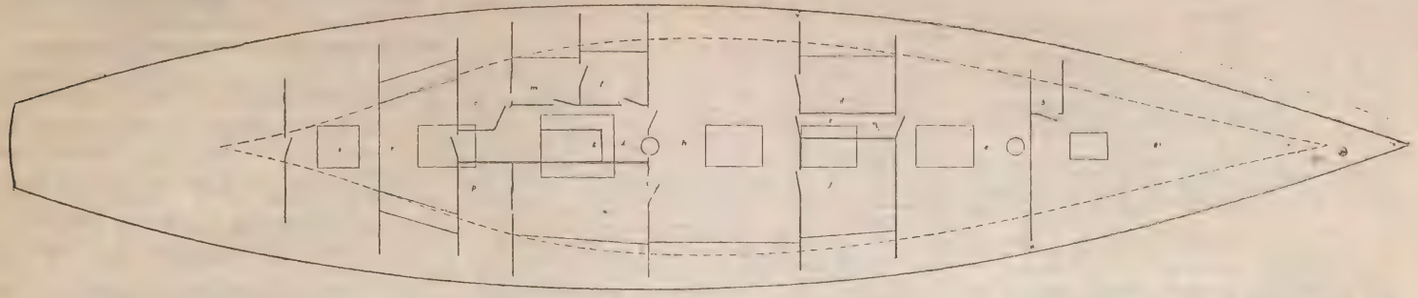
VOLUNTEER AND THISTLE.

Editor Forest and Stream:

It was evident, as the result of the first race between the Volunteer and the Thistle, that the former out-pointed and out-sailed the latter. It was different with the second race, and many of those who were capable of judging were of the opinion that the cutter, although she did not point as high as the sloop, actually went as fast or even faster through the water. It would seem as if this belief was well founded.

Let us suppose that the Volunteer was able to point only ½ point higher than the Thistle. The best that Volunteer would probably do would be 3½ points from the wind. This is good pointing from even the best of boats and was probably not surpassed on this occasion, when the sea was disproportionately high for the wind. This would make the Thistle point 4 points from the wind.

The shortest distance over which the Thistle could pass in going 20 miles to windward would be, at 4 points, 28.3 miles, while the Volunteer, by pointing ½ point higher, would only have to sail 26.1 miles or nearly 2¼ miles less than the Thistle. This will be made clearer by a glance at the accompanying diagram, in which for simplicity we will suppose that the boats each make but a single tack. This is all the more allowable, since each boat did in fact tack within two or three minutes of each other except just at the stakeboat, thus getting about the same slant of wind.



Let A be the starting point and B the stakeboat to be turned twenty miles dead to windward. These miles may be denoted by the intervals on the line 1, 2, 3, etc. Let A T be the course of the Thistle at 4 points, and A V that or Volunteer at 3½. As one point of the compass is 11.25°, four points will be 45°, and the line A T is 45° with the line A B, the direction of the wind, while the line A V is one-half point less or 39.38°. It will be seen at a glance how much greater distance the Thistle will have to pass over than the Volunteer, amounting, as said above, to 2.2 miles. Now the time which the Volunteer took to do her 26.1 miles to windward was 3h. and 46m., or at the rate of 8.6m. per mile. The Thistle took to do her 28.3 miles 4h. and some odd seconds or 8.5m. per mile. If for the sake of the argument we allow that the Volunteer pointed as high as 3¾ points, which is phenomenally high, and the Thistle ½ point less, then the Volunteer would sail only 25.1 miles while the Thistle would have to sail 26.87 miles. The rate of the Volunteer would then be one mile in 9m. and that of the Thistle 8.93m. per mile, so that the rate of speed of the two in going through the water is about as equal as possible. No allowance is made in this calculation for leeway, but as the Thistle would sag more to leeward than the Volunteer, she would have proportionately a greater distance to sail. It may then be assumed safely that the cutter did sail as fast as the sloop; going down the wind she actually beat her 2m. 54s.

This brings up for discussion an opinion which seems universal abroad and very prevalent here and that is, that a shallow centerboard boat will sail faster down the wind than a narrow keel boat. The reverse is true; that is to say, a well modeled keel boat of moderate beam, so as to get the requisite sail power, will beat a beamy centerboard before the wind. There are individual exceptions to this rule, but nevertheless it is a rule, as all intelligent yachtsmen on this side of the water, who have had much experience with both kinds of boats know. The Genesta beat the Puritan down the wind and the Thistle has twice beaten the Volunteer, and would always do so, in the writer's opinion. This idea that a centerboard must necessarily be at a keel boat going free, arises from the fact that the board could be elevated, and that a large amount of friction, or "skin resistance," be avoided. This scientific dogma of "skin resistance" has done more to ruin the proper shape of a boat on the other side of the water than all the other scientific contributions have done to improve it. If a centerboard boat beats, to any considerable degree, a keel boat going before the wind it is because she is a better modeled boat, or because she can carry a disproportionate amount of sail, and in either case she would have beaten her, board or no board.

It would seem to follow from the above demonstration that it was the board, and the board alone, which enabled the Volunteer to beat the Thistle in going to windward, and thus win the race; and it would certainly seem as if nothing had been discovered so far in naval architecture which can possibly give so large an amount of lateral resistance, with so little impediment to progress in close sailing, as a deep-reaching, thin and blade-like surface. For this reason the belief is very prevalent that all the skill and all the money in the world will not enable the best designed keel boat to go to windward with the best designed centerboard, and that so long as the contest is a windward one, so long it will be a waste of time and money for the keel to try to beat the sloop.

There are many who think differently, however, and these, especially the English, point to the undoubted fact that time and again the centerboards have been beaten by the cutters, and they furnish as a most notable example of this the career of Clara. This has certainly been phenomenal, and the Clara is, in the estimation of the writer, the most perfect specimen of modeling he has ever seen. She is as beautiful as she is fast. But the question comes up whether she has ever met a boat which is on the same plane with her. The Clara is the result of an evolution of a large number of boats of about her size, to produce which everything which skill could devise or money procure was employed. This is by no means the case with her competitors. The Cinderella is the only boat that pretends to represent the modern element of designing in a first-class sloop, and she is certainly far from a perfect specimen. She is too broad and too shallow, and does not carry her sail as she ought, or rather this was her condition when she met the Clara in the first year of her existence. She has been very much improved since then and is much faster, so that on one occasion she was beaten by the Clara when it blew hard only a couple of minutes. It has not been shown yet what the pick of a lot of Burgess boats of the same waterline would do against the Clara; and it is precisely the same thing with the Pappoose. No fair judgment can be formed until a larger number of modern centerboard boats have been built in this class and a larger number of races sailed.

Now, as to the size of the boats for the Cup races. When the competitor was chosen a few years ago by our English friends, the Genesta, a large-sized cutter, was selected, and as we did not possess any sloops large enough to contend against her we were compelled to build one. The following year a still larger boat was sent, and we were forced to build again to meet this increased size. Since the defeat of the Thistle, however, our English friends think, and have expressed the opinion in their journals, that the larger sloops do comparatively better against the larger cutters than the smaller sloops against the smaller cutters. It has therefore been suggested by them that the smallest boat allowable under the deed of gift should be built. This would be a boat of thirty tons, and their writers seem to be convinced of the fact that the regatta committee would follow their inclinations in this matter all through the scale of boat building, from the lowest to the highest. It is not at all sure, however, that the committee would do that. They might justly say that as the Cup races have assumed a national aspect it is only right and proper that the contestants should be of the first class, and should be the fastest and best examples of naval architecture, and this is best represented by the larger class of vessels. All the more would this

seem to be right and proper as it was our antagonists who selected the class. The committee might then well say, you may send a thirty ton boat if you choose, but we think it our duty to defend the Cup with the ablest exponent which we have, and this we have found in the larger class.

If, in answer to this, our English friends did send a 30-tonner, they would be assuredly beaten, for no 30-tonner that was ever built could save her time off the Volunteer. The Clara did not do it off the Mayflower in the Goclet Cup race of 1886; and what would she, or any other 30 or even 50-tonner do, against the Volunteer?

We know, as yet, little or nothing of the proper penalty which these large boats ought to pay for size, as they were at once elevated into a class of their own. It would, however, appear that they are, under the present ruling, taxed far too little.

The only way, then, for our transatlantic friends to get the Cup would appear to be to build a still larger cutter, and here they would be met at once with a still larger sloop.

Both the FOREST AND STREAM and one of its able correspondents have expressed the idea that in the Volunteer the acme of perfection in that class of boats has been reached, while the development of the keel can be carried still a good deal further. It would appear to the writer just the reverse, and that the possibilities of the centerboard are just in the beginning of their development. Of course, the limit must be reached pretty soon where the beam can be lessened and the draft increased; but it is a question whether even that has been reached in the Volunteer. It may well be that it has not, and the writer believes that a foot less beam and a foot more draft would make a boat which would be as fast in going to windward and more speedy before the wind. This can only be told by experiment. Moreover, the construction of the Volunteer is very faulty. She is a thing of bumps and billows from stem to stern. There is one on her starboard bow and one on her starboard quarter, and when one stands directly in front of her one sees nothing but a series of receding scollops formed by her frames and plates. All this might be rectified in another boat on the same lines. Then, again, it has not been shown that she will not carry a larger amount of sail. At any rate, if no improvements are made in her, she will be as all boats are, several minutes faster the second year than she was the first.

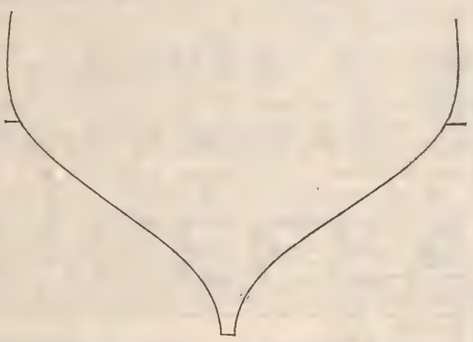
The trouble with our generous rivals is that they have been building boats for many years all on one plan without any comparison with other styles—indeed deliberately shutting their eyes even against such a suggestion. They have said to themselves, and pretty loudly too, to the rest of the world, "The Irex is the fastest boat in these waters and therefore in the world, and as the newly-built Thistle is faster than the Irex she must be by far the fastest boat in the universe." It ought to be said here, in justice to the boats themselves, that so far as the international series of races is concerned the poor things have all been badly—sometimes wretchedly—sailed.

The problem then which the English designers have before them, since the Irex is their criterion, is to build a keel boat of 85 or 86ft. waterline, which shall be able to give the Irex 20 to 25 minutes in a beat to windward of 20 miles; or if they take the Thistle from 15 to 18 minutes. This is not an easy problem; to many it would seem a hopeless one.

In conclusion I would say that it would appear as if the time had arrived when we are compelled to draw the line between a cruising and a racing boat. The future cruising boat will probably be a finely modelled keel with light spars and a moderate rig—a stronger, safer and on the whole a faster boat than the centerboard, because in cruising there is on the average more free sailing than windward work. The future racing boat, or if it is preferred, racing machine, will probably have moderate beam, deeper draft and more outside ballast. In other words a keel boat plus the board. This, I am aware, is contrary to the opinion of Mr. Bell, who frequently repeated before the race the opinion, that "the centerboard must go;" and go she did, and very fast, too.

X.

AN ENGLISH OPINION of Kunhardt's "Steam Yachts and Launches" is given in the London *Nautical Gazette*. From the notice, which is highly complimentary, we take the following: "The facilities for amateur navigation on the vast inland waters of the North American Continent, and along its extensive seaboard, are so great that it is not surprising to find yachting in all its forms flourishing vigorously in that part of the world. We know, to our cost, that in the matter of sailing yachts the Americans have managed to retain the international cup for many years by the superior racing craft they have, from time to time opposed to our best yachts, and wealthy United States merchants spare no expense in the construction and fitting out of commodious steam yachts, on board of which they, their families and friends, can voyage with comfort on their comparatively smooth and magnificent internal waterways. In connection with this special development of yachting enterprise in America, the publication of a work, such as this before us, may reasonably be expected to be of some value. The volume comes to us with a sort of prestige, and we certainly expect to find it complete and serviceable. In the case of Mr. Kunhardt's book, we may at once say that such an expectation is amply realized; it is a thoroughly good book; it accomplishes its author's object in being 'sufficiently comprehensive, and elementary at the same time, to suit the yacht owner's object of acquiring a general understanding of the whole, with specific information and data covering the most recent practice.' In view of the present extent and probable expansion of steam yachting, it is most desirable that those who employ such vessels should be possessed of some knowledge concerning the motive power and the mechanical arrangements by which their conveyances are propelled, and those who desire to make themselves acquainted with such matters cannot do better than read Mr. Kunhardt's book."



HOW VOLUNTEER WAS SAILED.—A great many things have come to the surface since the international races which prove that the American sloop was handled immeasurably better than her Scotch rival. On the Volunteer in the first race little schemes were being worked continually to get all the speed possible out of the yacht. First all the crew would be to windward, then as the wind lightened half of them would shift to leeward, and at times when the breeze was lightest all the crew were to leeward. This accounts for the angle which the Volunteer took going down to the Narrows, when every one thought she had more wind than the Thistle. Then again, after she got through the Narrows and caught the freshening breeze, it was the weight of half the crew to leeward that gave her such a list and made it look as though she had a fine breeze. Men were stretched along by the tackles which were secured to the sheets, and as the breeze lightened the sheets were eased a trifle to give the boat life, and were flattened again whenever there was a little more air. An outrigger was used to trim the jibtopsail. So many were the contrivances used for getting a little more speed that Mr. Wylie, the representative of the Thistle, was amazed, and declared after the race that he "had no idea the Americans sailed their yachts so well." On the Thistle, on the other hand, nothing at all was done after the start. Sheets were trimmed flat, the crew were assigned a fixed position, and all maneuvering thereafter was confined to the helmsman. This accounts in great measure for the "deadness" which characterized the Thistle's movements, as contrasted with her lively antagonist.—*Boston Globe*.

THE LAUNCH OF THE YAMPA.

TO the casual observer who has followed the season's yachting and read only of the doings of Volunteer and Thistle in the papers, it may seem as though cruising was of little importance to yachtsmen and that racing only engrossed the attention of all. That this is not the case, however, and that cruising is receiving its full meed of favor, and advancing hand in hand with racing, is shown by the recent additions to the cruising fleet and most of all by the latest, the steel cruiser Yampa, launched on Saturday last at Wilmington.

Throughout the entire season some fine little cruisers have been launched, only last week we chronicled the commencement of a cruiser of large size, but the yacht just launched is not only the largest, but the finest of the late additions to the fleet, a vessel that will be a credit to American yachting in every sea she floats on.

Like Fortuna and Intrepid, the two finest yachts which America has sent abroad for many years, the new yacht is from the drawing board of Mr. A. Cary Smith, the birthplace also of Iroquois, Oriole, Norna and Whim, each with a record already made. The step from the latter, a little wooden boat of 50ft., to the staunch and stately Yampa, is a long one, and yet the two are very closely connected. In 1885 the Whim was designed by Mr. Smith to the order of a gentleman not then known to yachtsmen, in fact a tyro, who desired to do some yachting about the Florida coast in company with his wife, and who named his first boat very appropriately the Whim. The little vessel took her stores and water in New York in the late fall and ran down the beach, encountering some very bad weather, but arriving safely in Florida. Lightened

SCHOONER YAMPA—MIDSHIP SECTION.

of her stores, she drew but 30in., and so was able to run into many interesting places from which most boats of her size are debarred, while her excellent seagoing qualities enabled her to do an amount of coasting and sea work which most very shoal boats are not capable of. Her owner, Mr. C. W. Chapin, found yachting to be so much to his taste that he determined to make it more than a whim, and on returning to New York in the spring the little boat, which made the trip up again in safety, was offered for sale, and an order placed with Mr. Smith for a far larger craft for the following fall, the owner's business taking him away from the water during the regular yachting season.

The new vessel, first christened Julia, but so well known since as Iroquois, was a steel schooner of 81ft. l.w.l., a centerboard boat drawing 9ft. Leaving New York late in the season Mr. Chapin spent the winter on board with his family about the Florida coast and the West Indies, the passage from Key West to Havana being made several times in very bad weather. The yacht not only proved herself an excellent seaboat, being both dry and easy, but she showed such indications of speed that Mr. Chapin determined to race her, and ordered an entire new outfit of spars and sails. Before these were ready, however, he sold the yacht to Mr. T. J. Coolidge, of Boston, who raced her this season. Another yacht was at once ordered from the same designer and builders, and this one will be ready in the course of another month for far longer voyages than either Whim or Iroquois.

The Yampa is a deep water cruiser in every sense of the word, the main object of her designer being to secure comfort and safety. The leading dimensions are:

Length over all	134ft.
Length on l.w.l.	110ft.
Beam, extreme	27ft. 1in.
Draft	13ft. 6in.
Ballast	95 tons.
Displacement	235 tons.
SPARS—	
Foremast, deck to hounds	65ft. 6in.
Head	11ft.
Foretopmast, heel to hounds	33ft. 6in.
Fore boom	33ft. 6in.
Mainboom	70ft.
Foregaff	30ft.
Maingaff	37ft.
Bowsprit, outboard	17ft.
Jibboom	16ft. 6in.
Squaresail yard	56ft.

In model the new boat is much like her predecessor, except that a deeper keel replaces the centerboard of the Iroquois. The Yampa has the same overhanging stem and the same stern as the other, in fact above water there will be little but size to distinguish the two hulls. Below, the sternpost has a draft of 13ft. 6in. with a moderate rake, about 20 degrees, the keel rising from the heel of the sternpost. The forefoot is moderately cut away, the draft all being in the form of drag aft. The form of the midship section is shown in the accompanying diagram. The least freeboard is about 4ft., with an 18in. bulwark and 3in. rail on top. The breadth is shown in the accompanying cabin plan. The hull is of mild steel throughout, the plating running from bottom of keel to rail without a break, all being flush. The keel contains 45 tons of lead cast solid between the floors, besides 50 tons of pigs stowed on top, so that she practically has a lead keel of 95 tons, or all "outside" ballast. The planksheer and deck are of white pine, the latter 2¼in. square. The side plating is carried up to form the bulwark, the rail above, 3x6in., being of teak. The hatch coamings and deck fittings are also of the latter wood.

Below the hull is divided by two full bulkheads, one abaft the galley and the other abaft the after saloon. The hold is of course quite deep, allowing plenty of room for water and stores, the deck above it being of 1⅛in. matched pine for the whole length of the vessel. The forecastle is nearly 30ft. long, with 8ft. headroom. The galley takes 13ft. of the length of the yacht, the space next abaft it being divided into a breakfast room 9x12ft. in extreme dimensions, a passage, and on the port side a stateroom. The main saloon is a fine appartment, 14ft. 6in. long and of the full width of the yacht, nearly 26ft. inside. Abaft it is the owner's room, 13ft. long, with bathroom adjoining, while on the port side of the passage are two smaller staterooms and a second toilet room. The passage and companion are very wide and roomy. The after cabin is 7ft. 6in. long and of the full width of this part of the ship, and abaft it, on the other side of the steel bulkhead, are the quarters for the captain and mate. The finish below will be in white pine, with furniture of mahogany especially designed for the yacht. Everything will be rich and elegant but there will be no attempt at shore decoration in the form of marble and stained glass. Deadlights are provided in the side for all the cabins. The spars are of Oregon pine, 20 and 21in. respectively, and are two of the handsomest sticks ever put in a vessel. They are perfectly clear from heel to head, with but little taper, while the mastheads are considerably reduced in size above the peak halliard blocks. The work about the mastheads is very fine, good oak cheek pieces, cross and trestle trees of locust, iron collars for the eyes of the shrouds and very well-proportioned hangers for the throat and peak blocks.

The yacht was built by Harlan & Hollingsworth, builders of Mischief, Priscilla, Electra, Nourmahal, Susquehanna, Iroquois and Alva, and as in all their boats the workmanship is excellent. The plating is very smoothly laid, and the woodwork, from the rail and hatch coamings to the joiner and cabinet work below, is all of the best. The sails will be made by Sawyer, and Philip Low will rig the yacht.

On Saturday last she lay on the ways, the cradle running the whole length and being very accurately fitted. The water, Christiana Creek, is so narrow opposite the yard that great care is necessary in launching, and the building ways are all laid at an angle with the shore line and the course of the river instead of at right angles to the bank, so as to give as long a run as possible to the vessels in launching. A heavy snubbing line is always used, rove through a compressor, so as to stop the boat as soon as she is fairly afloat. At 5 P. M. the tide was high and all was ready, and a few minutes later Mr. Chapin arrived from New York, in company with his little daughter Pauline. The word was given to rally up as soon as they were on board and the wedges were quickly sent home. Owing to the rocker of the keel no splitting of the keel blocks was required, the after part of the keel only resting on trip shores that dropped as she began to move aft. As soon as she was wedged up the planks holding the bilgeways and groundways together were sawn off and the yacht rushed swiftly into the water. As she made her bow to the land little Miss Chapin broke the bottle over the bows and christened her "Yampa," an Indian name for bear. The yacht will be completed in about a month and will then come to New York for a short time before sailing for a winter cruise in the West Indies.

CHALLENGES FOR THE CUP.

THUS far none of the rumored challenges from Ireland, Scotland and Nova Scotia have materialized, and there seems little likelihood that they will. Mr. Sweet has written to Secretary Bird of the N. Y. Y. C. stating that he will build a yacht of 69ft. l.w.l. to challenge for the Cup, according to the notice given in his previous letter. The subject of the revision of the deed of gift will come up at the meeting of the club to-night.

MONTGOMERY SAILING CLUB, Oct. 23.—Twenty-first weekly cruise. Course, Norristown to Indian Creek and return, distance 5 miles. Weather clear and cool, wind very light S. E., afterward fresh from the same quarter, making it a run to the buoy and a beat back. The start was made at 9 A. M.:

	Finish.	Corrected.
Priscilla, tuckup, E. Stanley	11 14 38	2 15 15
Gracie, skiff, E. A. Leopold	11 25 50	2 17 47
Josephine, tuckup, E. Powers	11 19 00	2 18 25
Flying Eagle, tuckup, J. Berndt	11 25 53	2 25 53
Lulu, tuckup, James Frith	11 28 20	2 28 09
Igidious, tuckup, Rachell Bros.	11 26 29	2 28 19
Princess, canoe, C. Wainwright	11 38 05	2 30 48
Bowers, tuckup, C. DeHaven	11 33 41	2 33 41
Iola, ducker, Geo. Walker	Withdrew.	

Winner, champion pennant, Priscilla. At 10:24:30 the entire fleet were grouped within 100yds. of the outer mark. They were so closely bunched that each boat was overlapped by several others. At this time the wind freshened, the Gracie catching the first puff, jibed around the mark at 10:25, the others following about ten seconds later, nearly all of the eight boats being in collision while rounding. No damage was done and no protests were made. The windward work soon scattered the fleet with the above result. Judge, Thomas Rochell.

YACHT DESIGNING AND SUPERINTENDENCE.—We call attention to the advertisement on another page of Mr. William Gardner, who has lately returned to New York, where he will follow his profession of designer and naval architect. Mr. Gardner, after graduating in 1881, at Cornell University, spent some time in practical work at Roach's shipyard, Chester, where he gained a thorough knowledge of practical construction. The following three years were spent under the instruction of the professors of the Royal Naval College, at Greenwich, Eng. On leaving there Mr. Gardner visited and inspected the leading shipyards of England and Scotland. We have had the pleasure of inspecting several designs and models, among them a keel yacht of the first class, and one for a war vessel of 4,600 tons, with a speed of twenty-one knots, which will be submitted to the Government after a further appropriation for new cruisers has been made. Another design is for a high speed steam yacht of 200ft., embodying some points entirely new in steam yacht construction, and giving an unusual amount of accommodation. Mr. Gardner is prepared to design and to superintend the construction of vessels of all kinds, for pleasure, commerce or war purposes. He is also the agent for the cement used on Thistle, as well as several other important specialties little known in this country.

"WASSERSPORT."—The number of *Wassersport* for Oct. 4 comes to us in an enlarged form and with a new heading, as the paper has lately been consolidated with "*Ahoi!*" the other yachting weekly of Germany. The prosperous growth of *Wassersport* and its present condition speaks well for the interest in yachting throughout the German Empire, as well as for the energy and enterprise of the gentlemen connected with it. Mr. Fritz Grunbacher, the present editor, is well known as a rowing man and writer on rowing and training. Canoeing is sharing the general prosperity of water sports in Germany, and a department of the paper is devoted to it. The present number contains very good illustrations of the leading American canoes.

THE CONDITIONS OF THE DEED OF GIFT.

Editor Forest and Stream:

Your comments on the revision of the deed of trust of the international yacht cup won by the America, which appeared in your issue of Oct. 13, were very timely and to the point.

The various rules of measurement, which from time to time have been in force for measuring yachts for allowance of time in yacht racing, have been the primal cause of bad models, besides a fruitful source of contention in challenge races.

In regard to the rules to be laid down in the new deed of trust, I beg to offer two or three suggestions which will leave no room for contention in the future, and will prevent the Cup from being won by unfair rules of measurement or by a fluke.

Let the measurement be the total dimensions of a yacht, by adding together the length over all, extreme beam and depth of hold. It is plainly evident that this is the only rule which will not tax the model of a yacht or cause designers to go to extremes in the dimensions not included in the rule of measurement, such as the extreme overhang fore and aft of the Volunteer and Thistle.

No race should be made unless the winning yacht averaged eight statute miles or more per hour over the course. This would prevent the Cup from being won by a fluke in a drifting match and without a test of models.

No single-masted vessel should be allowed to compete for the Cup which measured less than 100 nor more than 150ft. in total dimensions, and no two-masted vessel measuring less than 130 nor more than 180ft. in total dimensions should be allowed to compete for it.

A limit to the total dimensions of yachts competing for the Cup should be made, because the total dimensions of the America is 132ft., and a 30-ton yawl should not be allowed to capture a prize won by such a noble specimen of marine architecture as the schooner yacht America.

The foregoing rules should govern in all future contests for the international cup, no matter on which side of the Atlantic it may be, because some of our yachtsmen have gone nearly daft on cutter models, and would sooner see the Cup lost than won by a centerboard boat.

Total dimension measurement, however, should govern in future contests for the Cup, more particularly because under other measurement rules we have not improved the model of our yachts since the America was built in 1851.

The Volunteer, with all the wind she wanted from start to finish, was not able to average ten statute miles per hour in her second race with the Thistle, and her time has been beaten several times over the New York Y. C. course by yachts not as well rigged and ballasted as she.

Unquestionably we have improved in rig and ballast but not in models.

The total sum of the dimensions of the Thistle is 142½ft., the Volunteer 140ft. and the America 132ft. In a 20-mile race to windward and return the Thistle should allow the Volunteer 50 seconds and the America 3⅘ minutes. If the America was sloop rigged and ballasted equal to the Volunteer, she would undoubtedly prove to be the best model either on or off the wind. O. F. B.

BROOKLYN, Oct. 19.

[We cannot agree with our correspondent in his views as to measurement; the first result of such a rule as he proposes would be to cut off practically all the overhang of both Volunteer and Thistle, at once destroying all their beauty without improving them in any way. Until it is proved that an overhang at either end is a detriment no rule should be passed which would prohibit it. The direct tendency of such a rule, too, as long as most races are sailed in light weather, would be to encourage the old skimming dish, certainly a most undesirable type of boat. On the measurement given for Volunteer, 140ft., it would be possible to design an old sloop, say 100ft. over all, 95ft. waterline, 10ft. hold and 30ft. beam. Of course in any moderate weather no honest yacht would have any chance against the sail spread this craft would carry, her depth of keel being left unrestricted by the proposed measurement of hold. It is impossible to frame any rule with a reasonable certainty that in a few years it will not be out of date and working to the detriment of yachting. Looking back ten, fifteen, twenty years, the faults of the various rules then in vogue are plainly seen, and who can say that another dozen years may not witness such advances in yachting as will make the best of the present rules obstructive and bad. While it now seems probable that a length and sail area rule in some form will be the rule of the future, it is still a question which one, and as to the present rule of the New York Y. C. there can be no doubt as to its faults and disadvantages. The extent to which oversparring is encouraged is becoming more and more evident each season, and the rule itself will have to be modified sooner or later. To lay down a fixed and permanent rule, however good it may seem now, which shall govern all coming Cup races, is such an absurd and impossible undertaking that there is little likelihood of it receiving any serious consideration from the committee on the revision of the deed of gift. The action of every rule depends more or less on circumstances and conditions which are constantly changing, and which cannot be relied on from one year to the next. Improvements in construction, greater perfection of model, new ideas as to sparring, increased excellence in sailmaking, the many advances and discoveries in naval architecture and engineering all lead to constant changes in yachting; and any attempt to limit this advance by fixed rules can only result in robbing the international competition for the Cup of the value that has accrued to it of late years. There are some points which can be settled permanently now, before any further races are sailed, but the question of rules and measurement is one that must grow and expand with the development of yachting.]

THE INVENTION OF THE CENTERBOARD.

THE English papers are still discussing the centerboard, and there seems little doubt that some centerboard yachts will be built abroad this winter. Whether the board will be tried on a large scale is doubtful, considering that the Y. R. A. will not admit such a yacht to its races, but the report is current that Mr. Geo. Clark will build a large centerboard yacht, probably of Volunteer's size, from a design by Mr. Wm. Fife, Jr., and that should Mr. Sweet's challenge fail, Mr. Clark will challenge with the new boat. All things considered it does not seem likely that such a boat will be built in the face of the Y. R. A., nor is it at all probable that the rule prohibiting centerboards will be altered at present. Should such a yacht be built, then in Scotland or England she would be barred from all regular events, while there is little likelihood that she would be able to get any private matches with the keel boats. It is probable that the centerboard, thus far confined to small catboats (Unas) and cruising and fishing craft, will be tried more thoroughly than ever before, perhaps in connection with a heavy keel and depth, and such trials may be attended with some valuable results. Should they come into competition with the smaller keel cutters the results cannot fail to be interesting, but there is little likelihood that the keel will ever be superseded by the board in British waters, or that the board will ever be used other than as an auxiliary, a makeshift for shoal water. Just now a strong movement in favor of the centerboard is evident among British yachtsmen, and if it leads to a recognition of centerboard craft as legitimate yachts, and their admission on fair terms to the races, it will be good for British yachting. Should it lead to the adoption of the centerboard, instead of a further improvement of the keel fleet, it will work harm rather than good in the future.

Concerning the propriety of the claim of the British origin of the invention, the following extract is conclusive. There is a link still missing, the early development of the board in America, which some of our readers may be able to supply. Mr. H. A. Schank, a grandson of Captain, afterward Admiral John Schank, writes as follows to the *Field:*

"From the manner in which Volunteer thrashed Thistle, there can be little question that centerboard yachts are the fastest, most weatherly and handiest vessels in existence; then why do we not build a centerboard and fight the Americans with their own weapons? (which to my mind is the only way of bringing the America Cup back to this country). There would probably be an outcry if we adopt and make use of the invention; but by saying let us fight them with their own weapons, I do not admit that the centerboard is American, although, as you remark, they have had an almost exclusive monopoly of this contrivance for more than half a century and have become to regard it as of purely American origin; so with apologies for any plagiarism, it may be of interest to many of your readers to know that it was in America during the fatal contest between the mother countries and her colonies that Admiral John Schank, in a conversation on the art of shipbuilding with His Grace the Duke of Northumberland (then Earl Percy), who was on service there with his regiment, that the idea of sliding keels first suggested itself to the former. His Grace observing that 'if cutters were built much flatter, so as to go on the surface and not draw much water they would sail faster and might still be enabled to carry as much sail and keep up to the wind by having their keels descend to a greater depth; and that the flat side of the keel when presented to the water would even make them able to spread more canvas and hold better wind than on a construction whereby they present only the circular surface of the body to the water.'

"Admiral Schank coincided in this opinion, and observed that if this 'deep keel was made movable and to be screwed upward into a trunk or well formed within the vessel, so as that on necessity she might draw little water, all the advantages might be obtained.'

"After mature consideration of the principle thus suggested, Admiral Schank, in the year 1774, solicited Lord Percy, then at Boston, to permit him to build a boat for his lordship upon that construction. He did so, and it was found to answer in every respect. This boat was built with a single sliding keel, which reached almost her entire length. In 1789 he built a boat at Deptford with three sliding keels, and the following year the Trial cutter was built at Plymouth. Several other vessels were built on the same construction, and were in the service of the Government at the beginning of the present century, among them the Cynthia, sloop of war of 22 guns, which, from a portrait I have of her, appears to have been built with top sides, much after the style of the third-rate frigates of those days, ship rigged, with single topsails, topgallant sails, but no royals. The Lady Nelson, a brig of 60 tons, was also built with sliding keels, and in January, 1800, left the Thames on a voyage of discovery to Australia, and after a safe and rapid passage discovered and named the land between Cape Northumberland and Wilson's Promontory, her log being the most interesting I have ever read. There is a model of this vessel in the Naval Museum at Greenwich. The papers and certificates relating to these vessels are rather voluminous, therefore I will not trespass upon your valuable space with long extracts; but there is no doubt they were all smart, handy craft and most seaworthy.

"The Trial cutter was for many years engaged as a revenue cutter on this coast, and had to take the 'rough with the smooth;' all her officers and men were most unanimous in their praise of her seagoing qualities. She had a large keel amidships, 6ft. wide, a smaller one forward and another aft, each 3ft. wide, and all dropped 6ft. Lieut. M. Mabton and her officers certify that they were never in any vessel of her size that sailed faster or carried a greator press of sail; that she held a good wind, was very stiff, and could tack and wear away very quickly; also that none of the King's cutters ever beat her. It is sometimes held as a reason that we do not have centerboards because they would not be of any use outside the Solent. I do not think that is so, as, from the evidence of the vessels I have named, they proved themselves very seaworthy; and I should say centerboards would be found most suitable for cruisers. After the Trial had been inspected at Woolwich Yard, she left that place, and was proceeding to her station at Plymouth. Mr. James Templer, of Stover, Devon, who had given much of his attention to the improvement of naval architecture, was desirous of seeing the operations and effect of the keels in working the ship. He went on board and sailed in her to the coast of Devon, and on landing wrote that he was more than ever convinced of the great utility of sliding keels. During the voyage the Trial ran into shallow water, and the keels rose and fell without the aid of the winch and without damage. It would, therefore, be a very great advantage to yachts to be able to get into shallow or bar harbors, or to be able to run over rocks, shoals, etc., without coming to grief. Sir Samuel Bentham seems at one time to have been impressed with the advantages of sliding keels, and adopted them in the sloops Arrow and Dart, also the Netley, schooner; but they were afterward taken out on account of the wells leaking; however, this slight difficulty might easily be overcome nowadays with all our modern skill in naval architecture. With the wonderful qualities of the Volunteer before us, I cannot see how we can go wrong in building centerboards, so hope to see them ere long among our yachting navy."

HAMILTON NOTES.—Yachting promises to look up next year about Hamilton, Ont. The yacht club has given new signs of life and will take an active part in the Lake Association races. A new steel cutter from designs by G. L. Watson is to be added to the fleet, also one by Burgess on lines similar to the Pappoose, and the plans of a third cutter have already been received, concerning which Yard, take the following from the Hamilton *Spectator:* "The design and plans of the cutter to be built for Councillor Kilvert and several friends have arrived. They are beautifully finished and complete in all details. The cutter will have a waterline of 32ft. with 10ft. beam, and the lines give an idea of a boat of great stability, comfort and speed. The lower sail area will be 1,100 sq. ft. It will also be provided with a commodious cabin. The gentlemen who propose to build the yacht are very well pleased with the plans. C. P. Kunhardt, of New York, deserves great credit for his work."

AN EXPLOSION ON A STEAM LAUNCH.—On Oct. 23 the small steam launch May lay at the foot of 116th street, East River, the owner Carl Schmidtke being busy getting up steam for a trial trip, though hull and boiler were both old. John and Patrick Cunningham, were in the stern of the boat. When the boat was nearly ready to start the boiler exploded with great voilence, throwing the men into the water. Schmidtke was not seriously injured, but both the others were instantly killed, the bodies being almost cut to pieces by fragments of the boiler, the force of the explosion being principally backward. The boat at once sank.

NEW STEAM YACHTS.—Mr. N. L. Munro has sold the Now Then and it is reported that he has ordered from the Herreshoff Co. a seagoing steam yacht of 135ft. over all to be built of mahogany on the firm's double skin system. The yacht will be designed for great speed. Mr. Munro will also have a smaller boat from the same yard. Mr. John L. Frisbie, of Boston, has lately designed a steam yacht 100ft. long for Mr. Secomb, of New York. She will be built of wood, by Story, of Essex, Mass., at an East Boston yard.

THISTLE AND GALATEA.—Nothing has been heard of Galatea since she was reported a few days out from New York, but on Oct. 18 Thistle was spoken by the schooner Martha A. Bradley, lately arrived at Gloucester. The two were then in lat. 42deg. 44min., and long. 57deg. 46min. A dory from the schooner boarded the yacht and received a supply of water. All were well on board and a good passage thus far was reported. On Oct. 19 the schooner encountered a heavy southerly gale.

ATALANTA.—Mr. Jay Gould's steam yacht sailed from South Brooklyn on Oct. 25, her ostensible destination being Gibraltar, with a stop at Fayal for coal. She will wait at some Mediterranean port for her owner, who proposes to cross by steamer, leaving New York about Dec. 1. The Atalanta is in charge of young Captain Shackford, while her regular commander will cross with Mr. Gould.

ANOTHER CUTTER FOR AMERICA.—Daisie, one of the Clyde 3-tonners, will be brought out next year by Mr. William Clark. She is a Watson boat 28ft. l.w.l. by 4ft. 8in. beam, and has been quite successful in Scotland.

NAPHTHA LAUNCH RACING.—A second race between the naphtha launches of the Electra and Corsair took place on Oct. 25, from Tebo's pier around Buoy 18, Corsair winning by 30sec.

CARRIE E. PHILLIPS.—This name has been chosen for the new Burgess fisherman, in honor of the wife of the principal owner. The boat will be launched this week.

PAPPOOSE.—It is reported that Pappoose has been sold to a New York yachtsman, and that Mr. Adams will build another yacht from Mr. Burgess's designs.

The city contains a goodly number of enthusiastic sportsmen, and already they have made the best record by far of any season for many years. Prominent in this line are A. P. Barrows, J. G. Belrose, Henry R. Conger, W. L. Stone, J. Van Sicklin, W. F. Hendee, and Frank Dunbar. Wildfowl along the lake shore have been and are extraordinarily plenty, and sportsmen are having immense luck. As an example, Messrs. Stone, Conger and Dunbar brought in from "the Sandbar blind," north of the city, as a result of only a few hours shooting last week, five geese and fifteen black ducks and mallards; and Messrs. Belrose, Barrows and Van Sicklin, five geese and two ducks. The geese averaged nearly eleven pounds each, and were splendid specimens. The ducks also made a fine showing. Since then large bags of this variety of game have been brought in every day, and the sport is at its height. The marshes and bogs all along the lake are full of birds that stop over for a day or two on their way south. Over sixty plump geese and five hundred ducks have been brought into the city by local sportsmen thus far this fall, and the season has hardly begun. The lake has unlimited attractions for fall shooting, and is beginning to be appreciated by sportsmen from a distance.—*Burlington (Vt.) Correspondence Argus and Patriot.*

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

X., New York.—Madge won 6 races out of 7 sailed in America.

H. S. W., Larchwood, Ia.—Write to Dr. Van Hummell, Caldwell, Kan.

G. W., Concord, N. H.—The gun you name is a good one for the price.

F. L.—We have learned of no accidents in connection with the use of the gun.

A. N. O., Newburyport, Macs.—We have no record of the dog, write to his former owner.

F. V. W., Dardanelle, Ark.—"Training vs. Breaking" is the book you want, for sale at this office, price $1.

C., Linden, Mass.—Turk is by imported Rajah and out of imported Brenda. Countess is by Turk and out of Jule (Pierce's Grip—Baby).

F. E. T.—For lice on dogs use Persian insect powder, or a decoction of quassia wood. See full instructions in FOREST AND STREAM, Jan. 27, 1887, page 11.

C. P. O., New York.—There are few such boats about New York. A small cruiser would cost $400 to build and there are few second-hand ones to be had.

K., Eau Claire, Wis.—Marco (A.K.R. 2477) is by Mainspring (Mike—Romp) and out of Chic (Croxteth—Vinnie). Vinnie was by Dilley's Ranger and out of Corcoran's Bess (Taylor's Shot—Bevin's Nell).

W. E. B., Bristol, R. I.—So much depends upon the rearing of dogs, especially of the larger breeds, that it is impossible to give the average weight or height that puppies should attain at any given year.

B., Earlville, N. Y.—It is impossible to give an intelligent criticism of a dog from a photograph. Distemper is contagious, use Glover's distemper cure. Would not advise you to dock your dog's tail.

J. P. C., Leonia.—A, B, C and D are shooting clay-pigeons, the money is divided in two parts, first and second. A, B and C each break 21 out of 25. D breaks 19. Who is entitled to second money? Ans. If class-shooting, D.

W. S., Fruit Vale.—Hunting rail with a setter or pointer is very apt to seriously injure the dog for hunting other game, as it unsteadies him, and he is liable to acquire the habit of rooting up his birds instead of pointing them.

DEW. P., Salem.—Could a man train a bird dog so that it would be good for anything after studying a book on the subject? Ans. Yes, if there is any material in the dog to work on. Thousands of dogs have been trained by Hammond's book, "Training vs. Breaking," and thousands more will be. We publish it and the price is a dollar.

W. G. V., New York.—We do not know of any fishing places within two or three miles of the City Hall except from the wharves and piers, where boys and some men take a few fish. Occasionally a fair sized bass or other good fish is taken off the Battery. For better fishing go to Staten Island or to Coney Island Creek or down to Jamaica Bay.

L. D. C., New Orleans.—Lloyd's Register would be of little use to you, the price is 15s. per year, about $10 in this country. The term "three beams" signifies only that the length is three times the beam, and refers simply to proportion and not to absolute size. The "Cruise of the Coot" ran through 30 numbers and the "Cruise of the Pilgrim" through some of the same numbers and also through six numbers in 1887. These issues can be had at 10 cents each except a few which will cost 25 cents.

New Publications.

A CANADIAN BOOK ON SPORT.

CHASSE ET PECHE AU CANADA. Par J. M. Le Moine. Quebec: N. S. Hardy, 1887. Paper, 302 pages. Illustrated.

Mr. Le Moine is an industrious and painstaking writer, who delights to delve in grounds overlooked by others, and to bring forth rich treasures of historical and legendary lore. His contributions to the history of Canada have given him a permanent place in the literature of the Dominion. Strange as it may appear, our author has had an opportunity to gratify this penchant for labor in fields neglected by other literary workers, even in the preparation of a work on so common a subject as "Hunting and Fishing." If we are not mistaken, "Chasse et Peche" is the first book on this topic that has come from the French press of Canada. Considering the wealth of that country in game and fish, the great number of ardent sportsmen and the size of the French-speaking population, it is remarkable that when Mr. Le Moine came to prepare a comprehensive sportsman's manual in French for Canadians he should have found the field unoccupied. This, too, might be reckoned by any author a bit of good fortune, for in these days it is difficult to find a pathway of literary endeavor which has not already been trodden.

"Chasse et Peche" is designed to be for Canada in scope and mode of treatment what Mr. Hallock's "Gazetteer" is for North America at large. The first part (dedicated, by the way, to Mr. J. U. Gregory, of Quebec) relates to the hunting of large and small game, treating of the natural history of each species, the methods pursued in its capture, equipments of the chase, dogs, expedients, etc., and the resorts where game is found. These chapters are plentifully besprinkled with incident, anecdote and bits of curious information, and the reader is constantly made mindful in a pleasant way of the author's antiquarian tastes. Here, for instance, is the account of the great game preserve of Gouverneur Montmagny in 1646, which our readers will remember as described by Mr. Le Moine in the columns of this journal some months ago.

The second division of the work treats of fish and fishing, and is supplemented by a series of chapters reviewing the literature of Canadian sport, being a valuable resumé of the works of English, Canadian and American authors, among them being R. B. Roosevelt, Chas. Lanman, Chas. Hallock, A. M. Mayer, H. P. Wells and Geo. M. Fairchild, Jr., whose portrait we recognize as the caribou hunter on page 84. For his labors in their field as contained in this volume, the hunters and anglers of Canada are under obligation to Mr. Le Moine, and we hope that "Chasse et Peche" may be rewarded with the recognition it deserves. It is a pity that the publisher did not see fit to put the book into the board covers it was worthy of.

BOOKS RECEIVED.

A MANUAL OF NORTH AMERICAN BIRDS. By Robert Ridgway. Profusely illustrated by 464 outline drawings of the generic characters. Philadelphia: J. B. Lippincott Co. Royal octavo, cloth, gilt. Price $7.50. Deferring for the present our review of this work, we quote from the prospectus: "The object of this work is to furnish a convenient manual of North American Ornithology, reduced to the smallest compass by the omission of everything that is not absolutely necessary for determining the character of any given specimen, and including, besides the correct nomenclature of each species, a statement of its natural habitat, and other concomitant data. The analytical keys are unlike any previously used for any ornithological work in America, and are a model of simplicity, conciseness and utility. They answer exactly the purpose for which they are intended, all the essential characters being given, while their strictly dichotomous and antithetical arrangement is so entirely free from the confusion of headings and various complications of the older synoptical tables, that the merest tyro is able to at once understand and use them with absolute certainty of satisfactory results. Not only are the essential characters of every species and subspecies given, but the various plumages of each, depending on sex, age and season, are carefully distinguished. The nest and eggs are concisely described, the measurements of the latter expressing the average dimensions of a number of specimens selected for the purpose, and from which all abnormalities have been excluded. Measurements of the birds themselves are, whenever desirable for greater exactness of comparison with allied forms, made, whenever practical, from large series, in which case not only the extremes but also the averages are given. The geographical limits of the work also conform to those adopted by the American Ornithologists' Union; but it has been deemed advisable, for the special benefit of observers or investigators along our southern border, to include in the synopses all Mexican Cuban and Bahaman species of each North American genus, and also, in the keys to the genera, additional Mexican genera. Special exception to geographical limitation has been

made in the case of the petrels and albatrosses, pelagic birds whose fortuitous wanderings render it possible for almost any species to occur in our waters as an accidental visitor."

GRASSES AND FORAGE PLANTS: a Practical Treatise. By Chas. L. Flint. Boston: Lee & Shepard. Cloth, 398 pp. Price $2.

SECOND ANNUAL REPORT OF THE FOREST COMMISSION OF THE STATE OF NEW YORK FOR 1886. Prepared by the Secretary. Transmitted to the Legislature April 13, 1887.

A LIST OF THE MAMMALS OF MANITOBA. By Ernest E. Thompson, formerly of Carberry, and a corresponding member of the Society. Transactions of the Manitoba Scientific and Historical Society, No. 23. This is a new edition, reset and printed in better style than the first edition. Manitoba Historical Society. Price 25 cents.

FORESTRY DIVISION BULLETIN NO. 1. Report on the Relation of Railroads to Forest Supplies and Forestry. Together with appendices on the structure of some timber ties, their behavior, and the cause of their decay in the wood-bed; on wood preservation: on metal ties, and on the use of spark arresters. Compiled by the Chief of the Forestry Division. Washington: Department of Agriculture, 1887.

It was reported that a son of Baring, the English banker, was lost in the West while on a hunting expedition. A dispatch from Lethbridge, Northwest Territory, says the young man has returned there. He was snowbound ten days.—*Ottawa (Canada) Free Press.*

MAN AND OTHER ANIMALS.

Perhaps it may be interesting to your readers to hear how Mr. Ira Waterman got the best of the proverbially sagacious and crafty crows. I will try to tell the story as he told it to me. Although he is chiefly interested in raising big corn and rare kinds of grain, yet he enjoys a tilt with the woodchucks and crows; and has a happy way of setting off his prowess with the gun. After looking over his fine farm one day and listening to views upon the comparative merits of Russian and Japanese oats, I ventured to inquire if he was ever troubled by crows pulling his corn. "No, sir," he replied, "the crows don't trouble as much as they did. The crow families about here have dwindled a good deal since last year. George and I got a snap on them last spring that discouraged them some, and they havn't visited us much since." "You poisoned them I presume," said I, remembering my own experience and recalling the painful fact that the crows had not been much discouraged on account of my own efforts with a gun. "Yes, sir, I poisoned them with lead, cold lead. I'll tell you how it was. We had been troubled for several years by crows and they had got pretty plenty about here. Well, last spring we had a dead calf and kept him until he got just right, then we took him out in the gully there back of the barn and left him on the snow about six rods in front of that bank you see there. The snow had drifted over and made a steep bank about 10ft. high. We commenced well back toward the barn and dug underneath the snow till we got to the bank, then we made a room several feet long and high enough so we could stand up and move about comfortably. We had two port holes arranged so that we could see the carcass and know what was going on. If you had stood three rods from that bank you couldn't hear what was going on inside. We could talk as much as we pleased and the crows could not hear it. George had a double barrel gun and I a single one, and when the crows got to coming we went down and entered our fort. We could see dozens of them, cawing and strutting about; we could not see our calf; nothing but crows as thick as they could stand. I told George to take the right hand side and I would the left. I counted one, two, three, and we fired. You never saw such a fluttering and jumping; crows everywhere. Some flew and dropped more than half a mile away. We got sixteen at that one blast. Two or three times after that we got fifteen at a lick in the same way. I killed ten at one shot with my single barrel, and once we knocked over fifteen at once and one hawk. My son stuffed him, I wish you could see him; he is a big one." How many did you kill in all, I asked. "One hundred and ten in sixteen days. Can any of your breechloaders beat that?" I admitted that I was generally satisfied if I got one down at a time, and that I frequently failed to do even that. But didn't they get shy at last, I inquired. "No, sir, a crow isn't afraid unless he can see something, and don't you see there wasn't anything to be seen, so they kept coming till the snow melted and then our jig was up."—*W. in Lake Grove (N. Y.) News.*

Canvasback duck shooting will begin on the Havre de Grace flats in Chesapeake Bay on Nov. 1. The migration of wildfowl from the north during the past few days of cooler weather has been unusually large. On Monday an almost unbroken flight of coots passed down the Jersey coast. Old gunners watched them flying by all day. Already the flats at Havre de Grace are covered with fowl, mostly canvasbacks and redheads. It is greatly to be deplored that means cannot be taken to stop illegal shooting of the night gunners, who, with their big punt guns, drive the fowl away.—*Lancaster (Pa.) Examiner, Oct. 19.*

Several of the largest landowners in West Prussia have formed a society to promote the breeding of wild turkeys, which are not only very good game, but they are also excellent at table. There was a flock of wild turkeys, which was estimated at 2,000, in Richmond Park up to the reign of George II., and the Duke of Cumberland bred them in Windsor Great Park. There was also a flock at Holkham early in the present century, and it was there discovered that a brown Norfolk turkey may be made to resemble the wild bird by fattening it with walnuts soaked in water some days before killing.—*London Truth.*

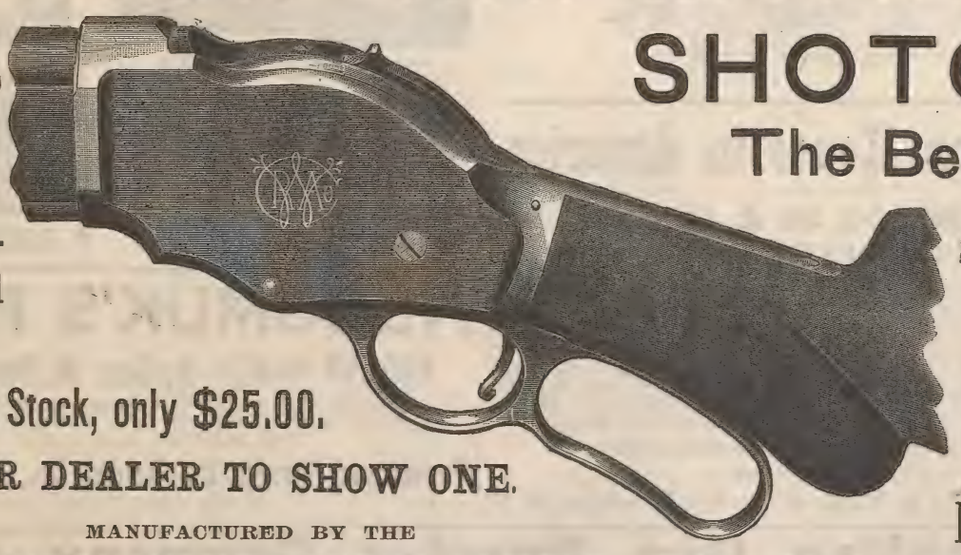
Among the Many Novelties

Introduced by us last spring were the

Dead Finish, Waterproof, Braided Silk Fly Lines,
FOR SALMON, TROUT AND BLACK BASS.



These lines have given perfect satisfaction and stood the most severe tests. *They do not crack, chip or become sticky and stiff*, but remain soft and pliable. These lines are waterproofed through and through, not merely on the surface. They will not become tender in use or by age.

Also a new style **LANDING NET,** made of *waterproof braided linen line*, which prevents the hooks from catching in the meshes. The prices of these nets are only a little in advance of the old style made from twisted thread.

FOR SALE BY ALL BOOK DEALERS

Forest and Stream Publishing Co., 40 Park Row, N. Y.

LONDON: DAVIES & CO., 1 Finch Lane.

The Schultze Gun Powder Company, Limited,

82 GRESHAM STREET, LONDON, ENG.,

Have the pleasure to announce they have opened an agency for the sale of their well-known Smokeless Sporting Powder, the

IMPROVED GRANULATED WATERPROOF

Schultze Gunpowder,

At VON LENGERKE & DETMOLD, No. 8 Murray Street, New York,

Where it may be obtained at WHOLESALE OR RETAIL. Price, $1.00 the canister, equal to 1 lb. Curtis's & Harvey No. 4 Black. Dealers' discount on application.

The Schultze Gunpowder has firmly established itself in England and on the European continent as excelling all rivals, giving GREATER PENETRATION, CLOSER PATTERN, LESS RECOIL, LESS SMOKE, LESS FOULING than any other powder. It has *no prejudicial effect upon the barrel*, and is *practically unaffected by damp*. Charge as compared with best black powde equal by measure or half by weight. **It is loaded with the utmost ease exactly as black powder.** It requires *no ramming* or pressure in loading. American cartridge manufacturers are no experimenting with a view to issue a primer of the same strength as the English primers to do away with any possible slow fire or the necessity for priming with a few grains of fine black powder.

As regards trap shooting performances, Schultze Gunpowder is the champion powder, having been used by the prize winners at all the principal meetings both in England and on the continen during the last eight years. During the late international week at Hurlingham and the London Gun Clubs, June 13-18, 1887, the gentlemen who used Schultze secured prizes amounting to £320. against £500 won by those using all other explosives combined. Numerous experiments carried out by the English Proof-House Guardians, and by the editor of the London *Field* and others hav proved beyond question that Schultze Gunpowder, while being equal in propelling force to the best English black powders, gives less pressure on the barrel even when subjected to varying temperature and is therefore as safe to use as black powder.

A NOTABLE ART ENTERPRISE

The Sportsman's Reverie.

A SERIES OF PICTURES FOR SPORTSMEN.

READERS of the FOREST AND STREAM cannot fail to recollect Mr. Thomas F. Watson's poem entitled, "The Sportsman's Reverie," printed in this journal about two years ago. Later on a few stanzas were added to cover other scenes of typical American sport with the gun. The author depicted vividly the varied visions which come before the view of the veteran sportsman as he sits in easy chair before the fire. Of the author and his poem the *Detroit Free Press* said in an appreciative notice: "The author is evidently a man of the most acute sportsmanly enthusiasm, as well as of nice literary taste. His poem is built upon a very simple plan. Before a cheerful fire—like Ike Marvel's hero—sits a veteran of rod and gun; he grows half drowsy over pipe and fire and the poet has caught—with a nice and sensitive appreciation—the reminiscences of a hundred hunts which flit through his brain. One experience after another is described with graceful pen touches; the quail, the woodcock, the snipe, the deer, fall before the crack of the gun; a long day's sport—a glorious day such as no man ever compassed between sun and sun—is described, even the trout, from the clear rapid, paying tribute to the prowess of a dreamland sportsman, until at last, with the fall of the quiet night shadows, the sportsman draws his boat to the shore, his tired retriever crouches at his feet, and, with his ducks, the final trophies of his sport, at his side, he looks back over the darkening water; and then, once again at his fireside, the end of the vision comes naturally and gracefully."

And now these "word pictures" of the poet have been complemented with the actual canvas pictures of the painter. Artist-poet and poet-artist have united to give us the poem in a magnificent setting. Mr. Robert Hopkin, the celebrated artist of Detroit, has painted a series of twelve pictures, each telling in color what the poem tells in words. From these paintings have been made superb heliotype engravings, each having beneath it the particular verse of the poem illustrated. The series is remarkable for strict adherence to nature, fidelity in portraying action, and artistic merit.

THE TWELVE PICTURES:

No. 1 shows the hunter seated in an easy attitude in an arm chair, gazing reflectively into the fire on the hearth. Above the fireplace are the head and antlers of a deer. The sportsman's right arm is around the neck of his dog, which is resting on his haunches beside the chair. His left hand holds his pipe. The firelight flickers on the floor and around the legs of the chair.

No. 2 represents dawn breaking over a small lake. The night shades are fleeing. A mist is rising from the eastern end of the lake, of which trees fringe the edge. A plover is circling in the air, and in the foreground is a mallard lazily flying out over the glassy water.

No. 3 represents snipe shooting. In the foreground is the sportsman, his body twisted around to the left in the attitude of making a double on snipe. Standing beside him is the setter, waiting for the word to retrieve. To his right is the border of a wood, the branches bending to the strong wind. In the distance are the sails of craft on the lake.

No. 4—woodcock shooting—shows an opening in the copse around whose border a brook is winding. In the foreground, standing deep in the ferns and rank vegetation, is a setter on a point. Behind the dog is the sportsman in the attitude of shooting at a bird flying directly over him.

No. 5 shows a quail hunter in the foreground, walking along ready for the shot, which will follow the rise of the birds, on which the dog is drawing to a point. A haze is over all, and the sky is that of a day in Indian summer.

No. 6 depicts grouse or partridge shooting in the beech woods. The hunter is walking down a slope. The dog has come to a point ahead of him. The bird has flushed and the hunter is shown aiming. The pointer has stiffened into an attitude of strained attention, as he watches the bird fly away. The brook is tumbling down through the woods and over the rocks into the pool. The sky is cloudy and the sunlight is struggling through.

No. 7 shows an angler reeling in a trout. A brook is tumbling down through the woods and over the rocks into the pool. The sky is cloudy and the sunlight is struggling through.

No. 8—deer shooting—is a forest scene. In the foreground a buck, just shot, is falling on the edge of a lake. Tearing down the slope behind him are two hounds. To the left, behind the roots of an upturned tree, are seen the head and shoulders of the hunter, whose rifle is still bearing on the deer.

No. 9 represents shooting over decoys. A gale is blowing and the water of the channel outside is lashed into whitecaps. In the bay the decoys are tossing in the chopping waves. In the foreground is a point of rushes, in which the skiff of the hunter is partially concealed. The flock of ducks, which has just swung in outside the decoys, is broken by the discharge of the first barrel. One section is wheeling out over the river. The other has broken off to the side and is wheeling out again to meet the first section. Some scattered birds are dashing above the head of the hunter, and he is twisted around in his skiff aiming at a bird flying above and behind him.

No. 10 shows flight duck shooting. The scene is a marsh, on whose broken surface the sun is setting behind the clouds. In the foreground, on a grassy point, are the hunter and his spaniel. The hunter is in a kneeling attitude and in the act of firing his first barrel. The spaniel is plunging into the water to retrieve the bird which has fallen to the first barrel. In the distance are flying ducks.

Nos. 11 and 12 represent the hunter retiring from the marsh and at home, and these two are among the strongest of the set.

The pictures are printed on the best 150lb. plate paper; size of paper 24×30in.; size of print 14½×17½in. The pictures have the tint and tint border, and the artist's remarque and signature, and form artist's proofs, an édition de luxe.

PRICE, $30 FOR THE SET; SINGLE PICTURES, $3.

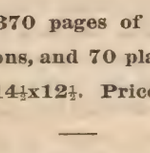
"SHOOTING."

The only English journal devoted exclusively to sport with gun and rifle is *Shooting*, edited by Sir Ralph P. Gallwey, Bart., author of the Badminton Library, and G. T. Teasdale-Buckell, Esq., who exported all the Llewellin setters to America and won the National Brace Stake and the Field Trial Derby four times each.



The most practical correspondence and the best selection of advertisements appear in *Shooting* weekly.

Few Americans ever heard the names of our best English gunmakers.

Price of *Shooting*, postpaid, $3.25 per annum. Send post office order to the Publisher, 182, Strand, London, England.

THE AUDUBON BADGE

Is a brooch pin in coin silver with the motto and monogram of the Society.

Chaste in design and tasteful in execution, it presents an attractive appearance, and is protected from tarnishing by a beautiful satin finish on its surface.

We are now in a position to execute orders for these badges to any extent. Wherever they have been sent they have met general approval, and every member of the Audubon Society should wear one as a reminder of the pledge and an open declaration of principles.

PRICE 50 CENTS, POSTAGE FREE.

Forest and Stream Publishing Co.

40 PARK ROW, NEW YORK.

The Forest Waters the Farm;

OR,

The Value of Woodlands as Reservoirs.

BEING THE LES ÉTUDES DE MAITRE PIERRE SUR L'AGRICULTURE ET LES FORETS.

PAR M. ANTONIN ROUSSET.

Translated by

REV. S. W. POWELL.

The introduction reviews the extraordinary movement of torrent taming in France, in preparing public sentiment for which the Studies of Master Peter played a noteworthy part. The book was written as a sort of science primer, setting forth the first principles of the relations existing between woodlands and agriculture. The principles and reasoning are not less applicable to the United States to-day than to France then.

Price in cloth, 75 cts.; paper, 50 cts.

ROYAL DIAMOND.....(A.K.R. 4311)
White English terrier, weight 18lbs. Fee $15.

Pups by above dogs for sale. Address J. W. NEWMAN, 87 Hanover st., Boston, Mass.

The Kennel.

MAINSPRING GETS FOR SALE.

Best Field Trial Blood in America.

A very choice litter of pointer puppies, handsomely, marked strong and healthy, five dogs and four bitches, whelped Sept. 12, 1887, by J. T. Perkins's field trial winner Mainspring (Mike-Romp) out of my Ferry (Tammany—Erie). These puppies combine the blood of the ideal bench show form, with the highest field qualities on sire as well as on dam side. Will sell at $25 each if taken soon. Please address T. FRANK RIVERS, 19 Prospect street, Bridgeport, Conn. oct27,1mo

English Setter Puppies.

From imported Flora, by Prince Fred II. (Emperor Fred—Kate II.) whelped July 7, 1887. Price $10. Dogs or bitches. Will guarantee these pups to be just right; strong nose, natural hunters, and very staunch with little training. They are not sold to close out any scrub stock or to make room, but were bred especially for the trade, as *business* dogs. Address,

H. J. PIERRE, Winsted, Conn.

CLIFTON KENNEL.

The pointer kennel of America for field and bench stock, offer for sale pointers, thoroughly broken; pups by champion Graphic ex champion Clover, and some by Mainspring ex Lulu. Address with stamp CLIFTON KENNEL, 203 Summit avenue, Jersey City, N. J. sep15,tf

DOGS FOR SALE.

Newfoundlands, St. Bernards, Mastiffs Setters, Pointers, Spaniels, Pugs, Yorkshire Skye, Scotch, Fox, Bull and Black and Tan Terriers, Blood, Beagle and Fox Hounds. Dogs and Pups at low prices.

B. MAUER, 164 N. 9th, PHILAD'A., PA.

COHANNET KENNEL.—FOR SALE, A beautiful litter of blue blood puppies, by Phil Warwick (A.K.S.B.5,676) ex Kaydid (A.K.S.B. 5,746). Also broken and unbroken dogs, with full and guaranteed pedigree. W. E. JONES, oct13,tf Easton, Mass.

FOR SALE.—BLACK POINTER DAISY Black (Peter Black ex Bessie), 2 yrs., handsome, staunch on all game, first class on partridge, fine nose, $40. One pup, 5 mos.; also new 12-bore L. C. Smith hammerless gun, $55. D. W. C. PARKER, 249 Main st., Springfield, Mass. oct20,2t

FOR SALE.—LEMON AND WHITE POINTer, broken on quail, 2½ yrs. old; a good one. Inquire C. S. B., JR., Commack, Suff. Co., N. Y. oct20,2t

FOR SALE.—TWO BITCH PUPS OF THE imported litter, by champion Orlando ex Countess of Woodlands, litter sister to the gigantic Albert Victor. W. WADE, Hulton, Pa. oct20,4t

LLEWELLIN SETTER PUPPIES.—A FEW choice ones; no better bred in America. In order to repair and enlarge my kennel apartments, I have decided to close out at $10 each, dog or bitch. If you want a first-class dog address with stamp, CHAS. YORK, 9 & 11 Granite Block, Bangor, Me.

FOR SALE.—ENGLISH BEAGLE HOUND pups, of good hunting stock and good pedigrees; one foxhound, trained, $20, one setter, not broken. Address with stamp, GEO. L. BARNES, Tyringham, Mass. oct6,3mo

FOREST AND STREAM

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, NOVEMBER 3, 1887.

VOL. XXIX.—No. 15. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications on the subject to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 30 cents per line. Special rates for three, six, and twelve months. Seven words to the line, twelve lines to one inch. Advertisements should be sent in by Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Reading notices $1.00 per line.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by express money-order, regi ered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. For sale by Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Davies & Co., and Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications,

ANSWERS TO CORRESPONDENTS.

IT MAY SOLVE THE BAIT QUESTION.

UNDER the terms of the present treaty, American fishermen are forbidden to purchase bait in British ports. Cod-fishing crews going out from Gloucester and other ports of the United States take with them supplies of herrings and clams for bait; and it sometimes happens that by reason of stress of weather or some other cause the bait is spoiled before it can be used. As we are living in the nineteenth century, it would be the most natural thing in the world, when the bait gives out, to put into the nearest Canadian port and buy a new supply, paying therefor in good United States money at current rates of exchange. Such a transaction, involving the exchange of money for herring, it would appear, ought to satisfy all parties, and it would certainly save to the fishermen the time consumed in sailing back to the United States for bait and returning to the fishing grounds. But the treaty forbids the Yankee to buy his bait in Canada; and it is quite clear that if some improved method of preserving fresh fish were devised, so that the bait taken from the United States would remain fit for use until actually put on to the cod hooks, one grievance of the American fishermen would be mitigated.

There is now in this country an agent of the Roosen process of preserving fish, which has been tested with great success abroad. The method is thus briefly described in the Bulletin of the United States Fish Commission:

For many years the value of boracic acid has been recognized as a preservative agent, but it has been left for a German scientist to discover how properly to apply it and rid it of all obnoxious properties or effects. This end is accomplished in the following manner: A strong cask of iron with an adjustable lid is provided, something like the well-known cans for carrying milk, but considerably larger. In this galvanized iron barrel are placed a certain proportion of water and a quantity of boracic and tartaric acid. The latter chemical has the effect of removing the slightest taste of the boracic acid, which, by the way, is perfectly harmless and even health-giving. The fresh fish are then placed in the liquid, as many as the cask will conveniently hold. The lid, which is fitted with a large india rubber ring, so as to make it perfectly air and water-tight, is now adjusted and secured. A small portable force-pump is next fixed to a hole in the lid, and the water is pumped into the cask, expelling all air, which escapes at another little hole in the lid. As soon as the cask is completely full and the air expelled the water begins to flow through the little aperture. An air-tight cap is then screwed tightly on this hole to prevent any further escape. Then the pump is once more set to work forcing in water, until a gauge affixed to the pump shows a pressure of 90 pounds to the square inch. By an ingenious contrivance the second hole in the lid is now hermetically closed, and the force-pump removed. The effect of the enormous pressure on the water is to drive the chemical right into the veins and tissues of the fish, and so prevent organic change in any part. So well is this done that the fish will keep for any length of time, and may be sent with perfect safety to any part of the world.

If the Roosen process be adopted it this country, it will not only have a vast influence on the trade in fresh fish, but it will render practicable the preservation of fresh herring for cod fishing, and make the Yankee skippers independent of British bait; and the occupation of the Capt. Quigleys will be gone.

DITCHERS AND DREDGERS.

THE improvement which has befallen a famous marsh in Mason county, Illinois, is the subject of complaint among the gunners who have grown gray in annual campaigns against the wildfowl that once resorted to that ground in multitude innumerable. The marsh lies, or did lie, along the Illinois River, on the western border of Mason county; and covered something over 200,000 acres. It was a grand shooting resort for ducks and other game. But all its glory has departed. The farmers whose property lies conntiguous have joined with the owners of the marsh lands in an organization called the Mason County Ditch Company; and intent on making wheat and corn grow where only ducks grew before, they have undertaken at an expense of $200,000 to drain the great "waste land," as they call it, and to "reclaim" it, just as if a territory which yielded its yearly crops of ducks was not highly productive instead of wasteful; and as if anybody else had any claim on a piece of land designed by nature for duck hunters. The work has been in progress for some time, and the glory of the Mason marsh has already departed; and they who once knew it shall know it no more. This "improvement" of a good hunting ground into wheat and corn land is of a piece with what is being done in every State in the Union, where ditchers and dredgers are at work and where game resorts are growing beautifully less. This is especially true of many of the Western shooting resorts. The Chicago *Tribune* complains that "the area of duck shooting is gradually retreating in circles around Chicago." It bewails the sport once to be had on the marsh between Englewood and Grand Crossing, on the river at South Chicago, and on the north branch of the Chicago River, from the limits of the city to its source. Stores and dwellings have supplanted bush-blinds and goose-pits. Even Calumet Lake has come to a pass where the hunters outnumber the ducks ten to one.

ARE THEY MONOPOLIES?

IF the ditchers and dredgers are to persevere in their work of reclamation, if marshes are to be converted into populous villages, if fashionable summer and winter hotels are to rise on beach and waste land, if forest lands are to be cleared, if pleasure steamers are to ply on lake and river, if railroads are to gridiron the wilderness, where is it all to end? "Nessmuk" has said "the game must go." Is there any other alternative?

The answer is found in books like the "Guide Book of the Megantic Fish and Game Club," which has just come to hand. This club has acquired the hunting and fishing privilege of a vast extent of territory in the Megantic and Spider Lakes and Upper Dead River region of Maine and Quebec, comprising in all one hundred and twenty square miles. This club is only one of numerous similar organizations already formed or about to be formed, to secure for their own members exclusive rights in fish and game.

Some of these clubs have leased stretches of marsh, mountains and swamps and points, some have taken possession of lakes and rivers and mountain streams. They hedge in their possessions with barb-wire, board fences, trespass signs; they equip game constables and policemen to warn off intruders and eject trespassers; and they answer this question of perpetuity of a game and fish supply by thus setting to work in an efficient way to insure it.

Are these clubs to be denounced as monopolists and their methods to be condemned as monopolistic? Such a charge has been brought against them; but can it be sustained?

NOTES AND COMMENTS.

THE game law of this State occupies a very hazy position in some of the northern, eastern, southern, western, upper, lower and middle counties. Where the fault lies we do not profess to explain. In some districts it is held that there is no law whatever to protect game birds; and this view is hinted in one of the game law compilations put forth from Albany.

It is said that some of the State game protectors have taken the stand that the song bird section of the act repeals the game bird sections, and these officers accordingly refuse to arrest game bird snarers; and some district attorneys take a like view of the subject. These opinions are local. However sound may be the stand of the non-arresting protectors and the non-prosecuting attorneys in certain districts, it is worthy of note that the laws are still held to be in force in this county, as three grouse snarers learned by practical experience in the Tombs the other day. If officials were disposed to do their duty the law would probably be found to work satisfactorily wherever actually tested.

There is only one district where the model game protector's work is to be seen in perfection. That is the vicinity of Flatbush, Long Island; and passing strange as the paradox may be, the FOREST AND STREAM has received repeated complaints of the raids of Sunday song bird shooters in this locality; it is, in fact, in response to such complaints that we have been advised, by the game protector in person, of the delectable condition of affairs there prevailing. The protector asserts with mild emphasis that no complaints can be made about Sunday shooting there by city hoodlums, because in the first place the Audubon Society has protected the song birds, and in the second place the birds have now all gone south.

The season for newspaper bear stories opens very tamely this year. In place of the ferocious monster that for a number of years has made his appearance in the daily press, reeking with the gore of devoured infants, we now have a mild-mannered brute, which climbs trees to elude defenseless yonng women. Something is clearly at fault: either it is the weakened imagination of the newspaper man, or else the bears themselves are changing their nature; in either case the times are degenerating, and bruin must soon lose his attractions for the reading public.

The Florida shark is a healthy substitute for the bear for all legitimate newspaper purposes, and if duly cultivated it will afford much instruction and entertainment. Here, for example, is a harrowing recital of the fate of a mail-carrier, whose route was from Miami and Lake Worth on the coast. He was crossing an inlet in his boat when the man-eaters beset him, assailed the boat, chewed up the oars, bit out chunks of the gunwale, and having thus made away with the craft, captured the mail-carrier himself. "Another blow on the frail boat and he was thrown headlong into the masses of the fierce seawolves. One shriek of agony and all was over. The sea was dyed for yards around with his life blood. Searching parties were sent out, but nothing found."

At a recent meeting of the American Ornithologists' Union, held at Washington, a committee was appointed to act in concert with the committee of the New York Academy of Sciences to secure funds for the erection of the proposed Audubon monument, to which reference was made in our last issue. The members of the A. O. U. committee are: Geo. Bird Grinnell, Wm. Dutcher and G. B. Sennett, of this city. It was the feeling of the meeting that all ornithologists and others interested in birds would be glad of an opportunity to contribute to the fund.

Mr. J. E. Bloom has severed all connection with the Ligowsky Clay Pigeon Co., and will enter upon the practice of law in this city.

SHOOTING A LEOPARD.

THERE is no more difficult animal to shoot successfully than the little blue buck (*Cepalophus pygmæus*) of southeastern Africa. It was some time before I could succeed in bagging one, as they frequent only the densest parts of the bush, and are excessively shy and wary, but after a long study of their habits, etc., I managed to become an expert pot-hunter. If in rambling through the bush I heard their shrill whistle, I knew the animal would be found in the same locality on the following day, either at sunrise or sunset, their feeding hours. Selecting a tree as a focus, I would roughly trim out some three or four diverging paths through the thick undergrowth, and my preparations would be complete for a murderous act on the next afternoon, when I would seat myself at the foot of the tree with a ready-cocked, close-shooting gun in hand. So soon as a shadowy form would cross one of the paths the gun would be trained for the next, and the instant it reappeared the trigger would be pulled, and the result would be the death of a small mouse-colored antelope, about 15in. in height. It was simply cold-blooded murder, as I frequently killed them when they were so close to the muzzle of the gun that their heads would be completely blown off.

I had one favorite ambush, about 150yds. from my house, which was within the corporate limits of Durban, Natal, where I was sure of potting one or two a week, but this was some twenty years since, and I doubt if one can be now found within miles of it. While sitting there one afternoon I had quietly amused myself watching the ants cutting up and carrying away a large caterpillar which had been placed in their path, when the low Virginia quail-like call of the Natal bush shrike (*Lanarius quadricolor*) caught my ear, and he soon made his appearance, accompanied by the female, in the lower branches of a small tree, just in front of me.

The retiring habits and bright coloration of the male make him eagerly sought by all bird collectors, and I longed to secure the skin of this one, but wanting a bit of venison for supper, I refrained from firing. They were soon joined by a pair of the lesser puff-backed bush shrike (*Lanarius cubla*) which flitted about in the upper portions of the same tree, thus giving me a fine opportunity of observing the habits of the two species. Quiet *quadricolor* and his mate kept down below, occasionally coming to the ground and turning over the dried leaves in their quest of insects, while the more noisy *cublas* kept above, frequently clambering, tit fashion, along the lower sides of the branches. After watching them for a while, a feeling of drowsiness began to steal over me, no doubt hastened by the monotonous song of the little tinker barbet* (*Barbatula pusilla*) in the topmost branches of the tree against which I leaned. Just then I was aroused by a crash of boughs, followed by the hoarse bark of the revret monkey (*Cercopithecus lalandii*). Slowly recovering consciousness, I began to inwardly swear at a supposed wandering Kaffir, who would interfere with my chances for a pot shot, when my feathered visitors showed signs of alarm. *Quadricolor* and his mate darted into the thick cover with a low quarrelsome note, while *cubla* sounded his harsh stridulous cry, and sailed away over the tops of the undergrowth, looking precisely like a ball of white floss silk with a black spot in its center. They were followed by a troupe of chattering, barking monkeys, swinging and leaping through the trees in every direction, and I began to accumulate an extra supply of Billingsgate Kaffir to launch at the intruder, when a large male leopard stepped into one of my rough hewn paths and suddenly crouched, head on, viciously switching his tail, indicative of a charge. I instinctively leveled the gun at his eyes, hoping to blind him with the contents of both barrels while in the act of leaping, and the instantaneous mental work I performed was something wonderful. I thought of a dozen different ways to get out of my dilemma, and dismissed the lot as impracticable in a twinkling. At the same time it seemed as if my entire body was a huge telegraphic instrument, every infernal click of which seemed to say, "Go home! Go home!" But my suspense was soon ended by the brute rising up and slowly stepping out of sight. Getting up and standing with my back to the tree, I was mentally debating about paying attention to the telegraphic warning, when there was a crash just in front of me, followed by the sharp whistle of a buck, from which I concluded that my late visitor had not only cheated me out of my game supper, but had missed his own also, and I quietly withdrew in the opposite direction, keeping on the alert for "sign" until clear of the bush.

On reaching the house the Kaffirs were started for my neighbors with the information that there was a tiger† in the bush, and all pigs and poultry had better be shut up for the night, while I busied myself in housing and securing several living antelopes in my collection. During the evening while sitting and chafing over my afternoon's experience, the persistent howling of the Kaffirs in their huts, just in the rear of my house, made me wrathfully spring up, with the intention of ordering a cessation of the row. Opening the door, my pettishness turned into mirth on discovering the precautions taken by them to prevent a nocturnal visit from the leopard. It was one of those steaming muggy nights, so frequent in semi-topical climates, but the temperature did not prevent them from having a roaring fire, which cast broad bands of light round about, through openings which they had made in the lower portions of the thatch of the bee-hive shaped structure. They were seated in a circle close around the fire, and singing one of those peculiar Kaffir songs, which consists more of deafening grunts than aught else. Judging that the uproar and light would serve not only as a protection to the Kaffirs, but the antelopes also, I concluded it would be best to stand the infliction, which I had to undergo until morning. We were all stirring early, and the Kaffirs soon found the spoor of my yesterday's acquaintance in the moist sand, but a short distance from the antelope pens. Not being willing to undergo a second night's annoyance, and surmising that the leopard was still in the neighborhood, messengers were dispatched with directions to notify the boys in the vicinity to come up in the afternoon with their dogs, and we would endeavor to force the brute into a tree, so that I could get a fair shot at him.

While engaged in putting the finishing touches on a bird skin, the house was invaded by about a dozen eager youngsters and about an equal number of curs. Stopping my work, I directed them to start the dogs into the bush, promising to join them as soon as the skin had been placed on the drying board. While in the act of hanging the board up beneath the oil cups, to keep off the thieving ants, the yelping of the dogs and shouts of the boys informed me that the game was afoot, and in a few moments an excited lad dashed in, exclaiming, "Hurry up! we have him treed." Picking up my rifle, I followed him out, and in passing the carpenter's bench picked up a hammer and nail which were dropped into one of the pockets of my shooting jacket. On reaching the edge of the bush I found the boys assembled, none daring to venture further, with the exception of my young scout, who had wormed in far enough to see the animal. Placing him just behind me and giving directions to the others to follow "Indian file" with as little noise as possible, we slowly pressed through the undergrowth but a short distance, when a nudge from my little guide caused me to stop, and on looking in the direction pointed, it was with difficulty that I made out the leopard, so well did his spotted skin harmonize with the speckled sunlight playing through the foliage. He was lying at full length on a large limb, some twenty feet from the ground, with his head projected from a fork, snarling at the yelping pack of dogs beneath him. As we approached him from behind, a slight detour was stealthily made, and on reaching the cover of a large tree on his right I found that a fair shot at his head was afforded. A sharp blow with the hammer sufficed to drive in the nail to serve as a rest, and pinching off a few leaves which interfered, I drew a fine sight for the base of his ear. At the crack of the rifle he convulsively sprang upward and fell sprawling among the raging curs, one of which he almost disemboweled and two others severely maimed in his dying struggles.

FRANK J. THOMPSON.

*Called "blacksmith" by the colonists, from its ringing, metallic note.

†Colonial name for the leopard.

CAMP LIFE ON DIAMOND POND.

IN the northern part of New Hampshire, about ten miles from the Canada border, among the rear guard of the White Mountains, are two ponds. They are fitly named Little and Big Diamond, for though differing in size they are gems and "gems of purest ray."

This is the location as given on the maps and they lie at a healthy elevation above sea level. Our experience of life there, however, places them at a much higher altitude; above the turmoil and unrest of business and society life, and we should define the limits of the place by bounding it on one side by Elysium, on another by El Dorado, on the third by Utopia; the fourth lying open to a debatable tract by which paradise or Boston are easily accessible.

Tourists may reach this place by different routes, all of which have their merits. A favorite route from this point is by the Sound steamers from New York to Fall River, thence to Boston and from there through the Crawford and Franconia notches in the White Mountains to Lancaster. At this point the tourist will take the Grand Trunk road, under Canadian management, and at once become conscious of a down grade as to comfort and convenience, and by the aid of two senses, become acquainted with the Canucks.

This is the way to go to Diamond Pond, but do not go unless you are a true lover of nature and can find "Tongues in trees, books in the murmuring brooks, sermons in stones," and beauty everywhere in the wild wood. If you are thus qualified, and are sure you will not sigh for beefsteak and vegetables, ceiled walls and carpeted floors, and can fight a good fight with black flies and mosquitoes, you will be safe in going, and we predict for you the best time you ever had in your life. You will need but little baggage; "biled shirts" and bustles, silk dresses and swallow-tailed coats are not "the mode" on the shores of Diamond Pond. As to dress, lightness, warmth and the free use of every muscle of the body are the things to be secured.

Leaving the cars at North Stratford, a drive of twenty-four miles over a good road, through a partially cleared country, will bring you to Little Diamond Pond and to Camp Diamond, consisting of two rude frame buildings and several tents.

On the opposite shore of the pond stands the cabin, as it is styled, where the writer and family have spent many pleasant weeks.

If you feel inclined to go over and take a peep inside, you will be furnished with a boat by the proprietor of Camp Diamond, formerly one of the "Boys in Blue," now a sturdy backwoodsman with a shambling gait, a good face, a slouched hat, brim straight up in front, and keen blue eyes that will "take you all in" while you are walking down to the boat house. You will probably be rowed across the pond by Jimmie, the little lad of all work, and if you have not put your trust in him by the time you have reached the other side, your knowledge of human nature is not worth much. The cabin, standing about 300 or 400ft. from the shore of Little Diamond, on the side of the mountain, is nothing more than a shanty of spruce boards, 30ft. long and 12ft. wide, lighted by three windows. The furniture is simple, and the different pieces not too numerous to mention. A small cook stove, a few camp stools for the boys and two chairs for the old folks, a table of spruce boards roughly nailed together, three bedsteads of domestic manufacture, a shelf serving as china closet and baking board, enough cups and saucers and plates to "go round," water bucket and tea kettle, frying-pan and grid-iron, dishpan and lantern, were about all we found necessary to a life of luxury and true enjoyment. No; one thing has been omitted—the rolling pin. Pie was necessary to this life of luxury, and to make it we must have a rolling pin, so one of the boys was sent out to get one. He soon came in with a section of a young tree a little over a foot long, and when the bark was peeled off and the ends whittled down we could compete with any pie crust in the market.

We learned one thing in this rudely furnished little shanty, how little besides health and a well-stored mind is really necessary to a true enjoyment of life. We do not condemn fine houses and elegant furniture, works of art and due attention to personal adornment, but it is consoling to know that if, in the mutation of fortune, we find ourselves deprived of these things, wretchedness is not inevitable; we may still be happy.

Six weeks of camp life proved to us that "man wants little here below," except in the matter of griddle-cakes and maple syrup, and here we found that quantity was very necessary, a little would not go far.

This reminds us to say a few words in reference to our bill of fare, which was as follows: Brook trout, varied occasionally by ham and salt pork, baked beans and bread. On Sunday morning, eggs, and plenty of them, milk, gilt-edged butter, cream that would hold a spoon upright, wild strawberries, tea and coffee, and all for the moderate cost of one dollar and twenty cents a week per individual.

It may now be interesting to know what we did all day. To sum it all up in a few words, life was one long delightful "loaf." We were virtually proprietors of an immense estate, and the resourses of forest and lake were at our command.

If we felt very energetic we were off to the woods, with tin cups and staffs to climb some breezy height and enjoy the view, or to search for a particular wild flower or fern. As in more cultivated regions we found it advisable and pleasant to take the boys along, and if we rambled far they would "blaze" a path, that is, cut notches in the trees that we might find our way home more easily.

Big Diamond Pond lay about three-quarters of a mile from our cabin, and as lovely a wild wood path led to it as ever our feet have trodden. This was a favorite resort, and with lunch basket, fishing rods and a good book, a day on these bright waters was a day well spent. Reading aloud or story telling beguiled the time while the boys lay in the boat waiting for a bite. Suddenly, as William Black expresses it, we would hear the "long shriek" of the reel, as the fish seized the bait and swam off with it, and so suddenly the boy that owned the rod was on his feet, eyes sparkling in anticipation of the fun, and the landing of that fish was for the moment more important than the balance of power among the nations of the earth, and required better judgment and nicer manipulation than a nominating convention before a presidential election. At noon we would land, select a spot near one of the fine springs which abound in this region, make a "smudge" to keep blackflies and mosquitoes at a respectful distance, spread our lunch and eat it with a relish unknown to the fashionable loiterers on a hotel piazza.

We recall one such occasion when a cracker spread with dried apple sauce, and a scorched trout, were more delicious than a "swell" dinner at Delmonico's, and that is saying a great deal for crackers and trout. Sometimes we were in the mood, particularly at sunset, to row or float idly over the quiet waters of Little Diamond, enjoying the beauty of the surrounding mountains and the cloud scenery which was sometimes marvelous in glory.

Once in a great while a little excitement would be thrown into our quiet life; a wagon would come into camp, or once in a greater while deer would come down to the shore of the pond to drink, and a prettier sight is seldom seen than these graceful creatures cropping the grass and splashing in the water, unconscious of the approach of a horrid man with a gun.

Generally, however, they are smarter than their foe, and, with a snort and snuff, are off to the mountains to take a little longer lease of their free woodland life.

Once or twice we were awakened in the night by the clanking of their little hoofs on the stones, and the scraping of their horns on the side of the cabin.

Cold or stormy days were spent in tent or cabin beside a crackling wood fire, with books and fancy work, cleaning guns, mending fishing tackle and telling fish stories.

Pleasant excursions may be taken from Camp Diamond to many places of interest. The drive through Dixville Notch to Errol, about twenty miles, is said to be one of the finest in the country. A ride of eighteen miles to Connecticut Lake is very enjoyable, and if your pluck is good, a short drive further over a road not paved with feather beds will bring you to Second Lake, where you will meet Uncle Tom Chester, who entertains city boarders, doing all the cooking, washing, ironing, etc. The stillness and grandeur of the forest at night are awe-inspiring, and as the shadows deepen, and the stars brighten, go out under the open sky and learn the lesson the ethics of the sky will teach; the great facts of gracious Omnipotence, and the soul's immortality.

In the foregoing we have tried to give some idea of camp life in New Hampshire, but the half has not been told.

If you would prove the truth of all that has been told, and realize a great deal more, go to Camp Diamond. You will have a pleasant trip, lots of fun and

"The cares that here infest the day,
Shall fold their tents like the Arabs,
And as silently steal away."

NORRISTOWN, Pa. C. L. S.

ADIRONDACK PLEASURE SEEKERS.

Editor Forest and Stream:

There is probably no popular resort in any of the Eastern States which, though ten years ago little frequented by summer pleasure seekers, is now visited by such numbers, from far and near, as the Adirondack region. This is naturally much deplored by the many who annually spent their spring or fall vaction there, year in and year out, and never tired of the place, as it abounded with both deer and trout, and was a sportsman's paradise in every sense of the word. But should they complain, when they see the hundreds of puny, sickly-looking people who go into the woods and in the course of a month or so return to the city, brown, healthy-looking and in the best of spirits? No. Of course it is hard for men who have enjoyed the beauty and wildness of the Adirondacks for years to see new hotels spring up in every direction, new roads cut through, and, worst of all, the clearings which are taking the place of woods in so many localities; but it is impossible that any place with the numberless attractions which these mountains have should remain the pleasure ground of a comparative few.

Five years ago I was in delicate health and was asked by friends to accompany them to the Adirondacks, where they had been for four successive years. They were sure it was the place to build any one up, no matter what the ailment might be. I went up and spent nine weeks, partly in camp and the remainder of the time at Blue Mountain Lake or off on short trips.

While there I did some hard work, but not too much at first, and I weighed (the day that I left for home) exactly

19lbs. more than the day I arrived. I have been there three years, and my smallest gain has been 10lbs. in three weeks. This may sound like a very pretty fairy tale to those who have not been there, but I have resisted the temptation to tuck on a pound or so, and have stuck to the bare truth.

Every season you hear from the guides that the deer are thicker than they have been for fifteen years; but this is all bosh, as they are slowly but surely on the decrease. I do not mean to say they are scarce, as there are yet many places where good sport may be had, and also an abundance of trout, when you have a thoroughly good guide. My advice to all those who go to the shore year after year without deriving the slightest benefit is, try the Adirondacks. C. N. B.

Natural History.

THE GILA MONSTER.

Editor Forest and Stream:

At the military post where I spent a short time collecting in southern Arizona I heard many accounts of the monster from the soldiers. It was thought by them to be very dangerous, and several went so far as to say that they had known of men and mules killed by having the breath of the animals breathed on to them. This was said occurred near the Gila River, where the men were encamped and where the monsters are known to be very numerous. I questioned many scouts, hunters, cowboys and settlers, and could learn of but one case that proved fatal, and that one was described by your correspondent "G. H. K." in your issue of Aug. 25. The Gila monster is common in the State of Sonora, northern Mexico, and is very much feared by the Mexicans. From what I could see and hear it is seldom found to measure over 21in. in length, although some have been found 26in. Several that I saw did not measure over 18in., and one only went 8in. Men in Tombstone, Arizona, near which place they are often found, have offered as high as $1 per inch for every inch over 21. A very large Gila monster preserved is on exhibition with numerous other Arizona curiosities in the Occidental Hotel, in Tombstone.

The tarantula I did not see in Cochise county, Arizona, nor in Sonora. I found many scorpions in the Sierra Madra Mountains, and in the towns below, but I did not see any answering to the description of the whip-tailed. Those found in the towns were small and light-colored, and those in the mountains larger and dark-colored. They are called by the Mexicans allecrants. Doctor M., with whom I was stopping in one of the Mexican towns, informed me that many children die from the bite of the scorpion, which in nearly every case proves fatal. They are very numerous in the houses after the rainy season commences. The scorpions I took in the mountains were got by displacing rocks and old logs; and sometimes under one rock scorpions and centipedes were found in company.

Mexico is very rich in its varied insect and reptile life, and at some future time I may write about some of the beautiful and curious lizards that I saw on the mountains.

JOHN C. CAHOON.

REASON AND INSTINCT.

Editor Forest and Stream:

I hear it sometimes remarked by friends or associates that it seems to them that animals (such as dogs and cats) are able to reason. The very form of the assertion, however, indicates a doubt and a consciousness that the opinion runs counter to a theory and popular belief. Now it appears to me passing strange that any intelligent man should have a doubt in this matter, for a little observation of the lower animals, coupled with appropriate reflection, will convince him that they reason as sharply as man, although not always so well nor in so wide a range. I venture to offer a few rough examples and observations on the general subject.

Reasoning consists in drawing a conclusion or deduction from two or more facts or premises. Thus, if I perceive a man fire a pistol at another who at once falls to the ground there are two facts from which I am justified in concluding that the one man has killed or seriously wounded the other. If then the one who fired the shot should fire a second at the prostrate man I should be further justified in the opinion that the first shot was not accidental, but intentional. The first deduction is mainly from two facts or premises, namely, the firing and the fall; and the second deduction is from three facts, namely, the firing, the fall and the renewed firing. Again, I get in a perspiration from physical exertion and then sit in a cool draught. A severe cold results. I readily deduce from the two premises involved that it is not safe to sit in a draught when perspiring, or that a sudden cooling of the body is not conducive to health.

If I see a strange track in the woods, and following up the trail come upon a lynx, the conclusion will follow that that animal made it; but this conclusion would be negatived and another substituted, if I should discover a panther in a tree near by, and upon shooting both the panther and the lynx find that the feet of the former exactly fit the track, while those of the lynx do not. Here opinion changes by adding to the facts constituting the premises.

If a dog follows a certain track and comes upon a rabbit, and by following a certain other track comes upon a panther; and if on another occasion we observe him show not only interest but pleasure and zeal when following another rabbit track, but exhibit hesitation and fear when following another panther track, we readily perceive that from the two premises in the one case he has drawn a very different conclusion from that drawn from the two premises of the second case.

If we note that a certain dog fears and hates pedlars carrying packs, and find by inquiry that the first pack-pedlar the dog ever saw had struck or kicked him, we should perceive that the one brute had drawn a too broad conclusion from the appearance and act of the other. If, later, we should find that the same dog had lost both fear and hate of pack-pedlars in general, and by inquiry discover that he had been fed and generally well treated by some pack-pedlars, it would be clear that the dog had reasoned himself into a modification of his first deduction.

If a horse trembles when his owner approaches, but exhibits confidence and pleasure upon meeting his groom, we know that the animal has reasoned from a very different set of facts in the one case from what he did in the other. In the one case the horse said to himself, "Here comes that man who beats me so often, I am afraid he will beat me now, because he has done it so often before under like circumstances." In the other case he says, "Here comes the man who feeds me good things every morning; it is morning now, so I think he is going to feed me again and I am glad."

A cow burns her mouth in attempting to eat hot mush from which steam is escaping. Thereafter she will refuse to eat mush which is steaming, thus drawing a sound conclusion from her first and only experience in mush eating.

Poultry comes flying to be fed when they see a dish set down in a particular place. They reason thus: "Previously when a dish has been set there we have found food in it. From those two facts we are sure in our opinion that there is food in it now."

It is needless to multiply examples, even if space permitted. These suffice to demonstrate that the lower animals form opinions from facts, and that those opinions vary as the facts do, within certain limits, and that they therefore reason precisely as men do. The difference obviously lies in the scope and range of mental action, not in its essential character. POTOMAC.

HINTS ON SPARROW DESTRUCTION.

Editor Forest and Stream:

American fruit growers, and agriculturists generally, are beginning to discover how great an error has been committed in the introduction of the English sparrow, under the impression that its insectivorous habits would render it valuable to the farmer and gardener, and now a general cry is raised for its extermination, to which end various modes of destruction have been proposed. Poison, the shotgun in the hands of boys, netting and trapping have been proposed, but the two former means, while far from adequate to the end proposed, would involve in unmerited annihilation many of our most beautiful and useful native birds. Netting and trapping would not pay unless a high bounty were offered for their capture.

The protection of hawks, owls, butcher birds, weasels, and other birds and beasts of prey has also been advocated and might be advantageous if they could be persuaded to feed exclusively on the sparrow, but unfortunately these carnivora will dine quite as readily on a goldfinch or a woodthrush as upon a sparrow. From my knowledge of the habits and fecundity of the bird, and I had forty years' experience with them in England, I am fisatised that any or all of the above methods will be quite inefficient in securing their extermination, or even in materially reducing their numbers. The only effectual way of preventing their increase and confining their depredations within endurable bounds is to pull out their nests during the breeding season and destroy the eggs and young. This, if carried out over the whole of the infested area, will limit their increase, while the host of those which have reached maturity will be diminished by the attacks of their furred and feathered enemies and by the shotgun of the ubiquitous boy. In my native county, Northumberland, when the sparrows became too numerous in any locality the farmers of the neighborhood would form a "sparrow club" and offer a bounty of three cents a dozen for the eggs or callow young, and six cents (3d. sterling) for the heads of the old birds; this policy would, in the course of a single season, effect a very appreciable reduction in the number of the birds and in the extent of their depredations.

A very good way to bring the shotgun into play is this: On a piece of level ground in front of a barn door or window or other cover, sprinkle a narrow train of small grain and seeds from the cleaner of the thrashing machine or fanning mill, beginning about twenty paces from the cover and carrying it on for forty or fifty paces. when the birds assemble, as they will do, to enjoy the feast, a light charge of powder and half an ounce of No. 8 shot aimed at the ground about one-third of the length of the train will sweep it from end to end. when the dead birds can be picked up and and the cripples caught and killed. I have myself got twenty-six from one discharge and I know others who have made even better shots than this. This should be done occasionally during the winter, the snow being swept or shovelled from the track previous to laying down the seeds. Besides the sport it might afford a source of revenue to the farmers' boys, as the birds would bring at least a cent a piece at the restaurants, where "sparrows on toast" is becoming a fashionable dish; and believe me, for I have tried it, that a well-made sparrow pie is a dish by no means to be lightly esteemed. JAMES T. BELL.

ALBERT COLLEGE, Belleville, Ontario.

MUD WASP AND HOUSE SPIDER.

AMONG the singular things that came under my observation during the past summer was a fight between a mud wasp and a house spider.

I was in the barn one morning in July standing near a broken window, when I heard a buzzing sound against the glass. This led me to look down, and there, almost under my nose, was a mud wasp in a spider's web. I was not surprised to see the wasp in the barn, for they are very fond of sticking their nests around any outbuilding, nor would I have been surprised had I seen a wasp carrying a spider to store away in his mud tunnel for his young grub to feed upon. The spider, however, that as a general thing they use for this purpose is what is called the wolf spider, the one that spreads its net in the crevices of stone walls, or where he has a hole to retreat to. But what surprised me most was to see a wasp caught this time, and that by a moderately-sized spider.

When I first discovered them the spider was working away for dear life to prevent the wasp's escape. He had fastened the wasp's wings so securely over his back that he could scarcely move them, and two of the captive's legs were entangled. The spider was working at one of these legs when I looked down. As fast as it was bound the wasp would bite off the web. But, of course, I could not see the web as plainly as I could see the insects. Had the wasp been able to turn his head he might have freed his wings in the same way that he freed this leg. But here was the difficulty. The spider had him suspended by his wings, his body hanging down and all the legs on one side free.

Of course I was interested at once, and I must say my sympathies were with the plucky spider. As I said, the spider was at work on one of the wasp's legs when I discovered them. I had only watched them for a minute or more when I saw a quick movement on the part of the wasp, and in an instant the spider was on the wasp's head —or so it seemed to me—and appeared to be biting him. But in this I was wrong. I only had to wait half a minute, when the spider drew back, and to my astonishment the wasp had one of his front legs in his mouth. On this the spider crawled slowly away to the upper corner of his web. He acted as though he had been injured, and yet he ascended quite lively considering that one of his climbing legs was gone.

Meanwhile the wasp seemed to take particular pleasure in biting this leg. I could see it move. He appeared to be passing it backward and forward through his mouth, much as a cuckoo does a tent caterpillar before he swallows it, or a robin an angle worm before it disappears.

But now more efforts were made by the wasp to free himself. I thought for certain he would get away. It did not seem possible that a spider's web could stand such struggles. This went on for two minutes or more, when all at once the wasp was still. Tired out, thought I, and so no doubt thought the spider, for down he came and commenced to weave again the cords that had been broken. He was near the wasp's head now, and appeared to be throwing his net over that portion of his victim's body.

The wasp's rage meanwhile was seemingly tremendous. He had waked up. He kicked and squirmed, and drew his body up and threw it back again, and exhibited every passion of which we can imagine a wasp capable, when quick as thought I noticed him make an unusually desperate effort, and again the spider was on the wasp's head; or so it looked to me. He appeared to have jumped upon him, just as when a small fly is entangled in a web and does not require to be bound, the spider bounces upon him. And now all was still for half a minute. The spider appeared to be on the wasp's head and sucking his blood. I thought for certain he was doing so and was about to congratulate myself on the spider's victory, and thinking, "I never knew before that the bite of a spider would kill a wasp" (for wasp and spider were perfectly still), when the wasp drew up his hinder parts, which were free, and three different times I saw his stinger pierce upward in rapid succession into the spider's body. And now said I, "it is all up with the spider," for I know the paralyzing influences of a wasp's sting on any insect. But no, the spider drew back slowly again and this time the wasp had one of the larger weaving or hind legs of the spider in his mouth. It now seemed hard work for the spider to retreat. He did so though and again seated himself in the corner of his web. The wasp gradually worked himself free, scraped the net off from his wings, and went away.

For several days after the battle I saw the spider minus two of his legs, crawling slowly over his web or sitting in the corner of it. He did not die from the effects of the fight, though, so far as I could discover. A. H. G.

SING SING, N. Y.

GROUSE AND LAWN TENNIS COURT.—Sing Sing, Oct. 26. —While crossing the lawn tennis court of Mr. Archibald Rogers, at Hyde Park, N. Y., one morning last week, we were surprised to find a ruffed grouse lying on the ground dead. It was hardly cold and the feathers were perfectly dry, although it had rained during the night and the ground was damp. What had caused the death of the bird was the question. But it was a question very easily answered. At each end of the tennis court is a piece of wire netting, tacked up to stakes that stand about 4ft. high, thus forming a light fence that prevents the balls from going very far out of bounds. The grouse had struck one of these fences and broken its neck. There was a dent in the netting some 8in. deep where the slack of it was driven out as though a heavy stone had been thrown against the wire. Only three or four feathers lay on the ground. The bird's neck was bent aside and turned somewhat under the breast. Death must have been instantaneous. We have heard of partridges flying against houses and telegraph wires, but never before against wire nettings on a lawn. Will some of the readers of FOREST AND STREAM tell us what they have observed? —A. H. G.

Camp-Fire Flickerings.

"That reminds me."

223.

IN the fall of 1868 when I was visiting professionally the reduction works of the Cook Mine in the ninth concession of the township of Marmora, in the county of Hastings, Ontario, a bear one night killed a fat hog on a farm about two miles down the river, and took the carcass to a neighboring piece of woods, where he made his supper. The next night two men, armed with guns, went to watch what was left of it, but the listeners in the farmhouse heard no report up to the time when they went to sleep. In the morning, when the watchers were asked as to whether they had seen the bear, they answered no; the only thing they saw was that about 10 o'clock two black calves came and smelled around piggy for awhile and then went away into the woods. But when the farmer went to see whether any of the slain hog might be convertible into salt pork he found that the "black calves" had taken the remains with them.

BELLEVILLE, Ontario. J. T. B.

SCHULTZE POWDER.—Centralia, Pa., Oct. 25 —*Editor Forest and Stream:* Can not some of the readers of your paper who have used the Schultze gunpowder give their experience with it whether good or bad? If facts bear out the eight recommendation given in your issue of the 20th, it is what every sportsman needs. My experience with some of these "new fangles" has been far from a satisfactory one, and I am a little suspicious.—SPICEWOOD.

"SPORTING TOPICS" is the new name of our Boston contemporary formerly known as *Judge and Jury*. The change of title is greatly for the better, and there ought to be room in Boston for *Topics* to flourish.

Game Bag and Gun.

THE "SPOTTED" CURLEW.

AFFECTIONATELY DEDICATED TO THE WARY NINE-INCH SICKLE-BILLER, LATE OF ALAMEDA MARSHES, BY J. G. B.

Pipes.

"I'M safe—I'm safe; from dan-ger free;
Oh, who would not a C-u-r-l-e-w be?"

Fowler's Soliloquy.

There on the sand-spit you repose,
Comporting yourself as if to doze;
When I could "raise" you, if I choose,
From even here.

If you wish to raise my ire,
Cross within my line of fire,
And see if I don't "knock you higher
Than a kite."

I have that at my command
That in your vicinity I could land,
Were I disposed to raise my hand;
But I forbear.

By and by will come along
A flock of curlew forty strong,
And around you they will throng
Over there.

Soon after some obliging cuss
Away beyond will raise a fuss;
Only making matters worse
My "pip" for you.

Your attention will be distracted,
A tragedy will be enacted;
But this too long has been protracted,
And all for you.

You will rise with uproarious clamor
(Simultaneously with my hammer),
And vociferously you'll stammer
Apologies profuse.

But I shall not them accept;
And beg, my friend, that you'll reflect
On the "rattling" charge you'll intercept
When I "cut loose."

You rise at last; with breezes toss'd,
My whereabouts, alas! you've lost;
Escape you must, at any cost,
But how, and where?

You are egged on well now from behind
By officious friends to danger blind;
My whereabouts at last you find—
Too late.

With visage grim I rise and poke
A glistening barrel; "Fire and smoke,
It must have been a double choke
To pierce so far."

Pipes.

"Why does experience come too late;
Did not I deserve a better fate
Than flying foul of Number Eight?
Farewell."

A DAY'S GUNNING.

IN common with many other subscribers of your paper, I read of exploits with rod and gun by old veterans who have became used to looking on big bags with a calm indifference, but experiences of a real novice, a beginner, are rather rare.

Now, I think there must be others who, like myself, are much interested in outdoor sports, but who have not as yet done much in that line.

If this account of my first experience of shooting over a dog interests any one half as much as I have been interested by some articles in your paper, I shall feel amply repaid for writing it.

Two weeks ago according to agreement the Doctor drove up to the door of our house, and soon after, being joined by me, we were rolling along toward our destination, about six miles out in the bush. The air was bracing, and after a pleasant but rather chilly ride of about an hour, we tied up at a cosy-looking farmhouse near the locality we proposed to hunt over.

It being early for the birds, we spent half an hour or so looking for "grays," but found none, quite a number having been shot there this season. Working our way round we entered a likely looking piece of woods, and not 50ft. inside Nat, the Doctor's setter, pointed. She did look beautiful, her head stretched forward, her nostrils dilated and her jaws moving slowly, "drinking it in." The Doctor approached and flushed the bird, but by putting a pine shrub in line of fire it escaped unhurt.

We worked that piece of ground pretty thoroughly and had three fair shots, but with no result. The birds did not lie well to the dog and flushed wild, plainly showing that they "had been there before." One old bird played a pretty neat trick on us in this manner. Nat came to a point in rather rough ground, but soon broke it, and made another a few yards further on. The Doctor called me to his side, and I soon saw the reason; the bird would run a few feet and then stop, so that the dog could not keep a steady point. We let the partridge run, not wishing to shoot her on the ground; but she ran under a ledge, and when fairly out of sight rose, not even giving us a glimpse of her. For the rest of the morning until 10 o'clock we saw no game whatever. They weren't there, for if they had been I am sure Nat would have found them. Nat is a beautiful, intelligent black, tan and white setter bitch, about four years old, a very thorough and rapid worker and staunch as a rock when on a point.

Finally, seeing some brush which he thought promised well for woodcock, the Doctor motioned Nat into it and followed himself, leaving me to do outside work on a road parallel to the woods. Hardly were they inside when Nat stood a bird. The Doctor advanced, flushed it, and at the report of his gun (a W. & C. Scott hammerless) I thought I saw the bird plump down in the underbrush. I told the Doctor, and he sent the dog in to retrieve. The dog couldn't find her, and we thought that I had been mistaken and the Doctor had missed his bird.

We had worked along through the tangle for some time when Nat "pinted," broke and pointed again. On going in to flush the bird the Doctor saw her on the ground, and when Nat retrieved we found the bird to be the same one the Doctor had fired at away back. She had one wing broken and had traveled between an eighth and a quarter of a mile in that state. Crossing the road we flushed a partridge, who got off with a whole skin, though the Doctor did his best to convince her that she had better stop with us.

The next hour was spent in laboriously traveling through young scrub oak, a tiresome occupation, and we were by no means disappointed when we reached some more promising and also more open ground. Nat pointed a bird very soon and the Doctor missed a rather difficult shot.

With one bird brought to bag, at 11 o'clock we thought we weren't quite doing what we ought, so we made a break for perhaps half a mile until we struck a place that had the "real look" to it. Before we had been in these woods five minutes Nat pointed, and flushing the bird the Doctor scored a miss. Finally we separated, the Doctor taking the dog and working the high ground, while I did outside duty in the meadow below.

As I followed the course of a small brook which ran through the meadow I came upon three birds at one of its numerous turns, and being startled made a miserable miss with the first shot, but scored a bird with my second.

I had heard the Doctor's gun several times and was not surprised when he met me with a partridge and a woodcock to his credit. Nat coming up, retrieved my bird from the brook in great style.

We now crossed the brook to the edge of the meadow where a thick growth of alders presented a good retreat for woodcock, and Nat soon pointed in her usual style. The bird flushed wildly and we could not put her up again but being ahead of the dog I soon flushed one and missed, walked 10ft. further, flushed another and missed as usual, but he was dropped by the Doctor at my cry of Mark!

As it was now noon the Doctor and I returned to the wagon with our morning's bag of three partridge and two woodcock. After eating our lunch under the shelter of a stone wall, we again sallied forth to the same place and to resume our interrupted sport.

All the afternoon or until four o'clock we got no birds. they were very wild and strong, hard flyers, not to say that we got no shots for if I remember rightly I made three bad misses. Along toward four we found ourselves in the same meadow mentioned before. Nat pointed a woodcock and in spite of repeated attempts on the Doctor's part to induce the dog to flush the bird himself, she budged not an inch and the Doctor flushed it himself. We both missed that bird.

On our way up the meadow the Doctor made one splendid shot, taking a towering bird just when I thought she was lost. And five minutes after we got another, that is he fired and hit her and as she passed me she got another charge in the neck, bringing her down like a stone. These two brought the result of our day's sport up to five partridges and two woodcock. Just enough for a good day's sport. To finish my nearly completed score of blanks I missed a bird which flew directly across the open in front of me, flushed by the Doctor, and that after I had been fully prepared by a cry from him. Although the day was on my part a "chapter of misses," I never spent a pleasanter day afield in my life.

And so it goes. A day's gunning is not complete unless there is an ample sprinkling of misses and other incidents. It gives one something to think on, and what is one of the chief charms of such a sport but as a constant furnisher of mental food.

PEMIGEWASSET.

WORCESTER, Mass., Oct. 22.

TEXAS NOTES AND NOTIONS.

SO far this fall we have had an exceptionally good shooting season. Migratory birds have not arrived in any considerable numbers as yet, but all the conditions for plenty of them later on are good. A heavy live oak mast with plenty of water in the creeks and bayous are never failing indications of a good supply of waterfowl during the winter. The prairie chicken season opens here Aug. 1—a month too early—the weather being too warm for either men or dogs to hunt with any comfort. A few misguided, unregenerate individuals, however, will insist on tempting Providence by rushing out at the opening of the season. They are of the class of hunters who shoot game on the wing, on the ground, or club it to death; any way to get it. Happily this class has few representatives here. Quail have not been so numerous for years as at present. Our last Legislature passed laws prohibiting netting and snaring and extended the close season to Oct. 1. This, I think, in a great measure accounts for the increase. Bags of seventy-five to eighty-five for a day's shooting to two guns have been reported during the past week. Deer are (as the market reports in papers say) in moderate supply and firm; that is firm in their determination not to be hauled out of the bottom if they can prevent it. So far this season have heard of but two having been killed; one by the writer early in September and one by a hunting companion a day or two since.

This last deer was killed with a 22-cal. Winchester single shot rifle. The cartridge contains 15grs. powder with a 45grs. naked bullet. I became an early convert to the capabilities of this gun as a weapon for large game. I tested it thoroughly for range, accuracy and penetration with the most surprising results. Four one-inch yellow pine boards were stood on end against a rifle butt. Against these a 3x6 scantling was placed, making 7in. of solid yellow pine. Any one acquainted with this timber knows it is by no means soft—it is fully as hard as well seasoned ash. The gun was fired at about fifty feet from the target, and on examination the bullet was found to have passed entirely through the 7in. of pine and into the butt. We dug the bullet out and found it had upset and spread out for about half its length, so that the front end of bullet was at least double its former diameter. The holes through the boards were of a size that easily admitted my little finger up to the first joint. For range and accuracy, I tried the gun with target sights at 200yds., Hinman target. After getting sights adjusted I made five successive tens without cleaning, shooting with a rest. The advantages of this gun as a hunting weapon are its small size and weight, the ease with which 50 or 100 rounds of ammunition can be carried, together with a remarkably flat trajectory, which, taken altogether, obviates the danger of taking the wrong gun when you go hunting with a rifle.

Another new gun that is rapidly gaining favor with sportsmen here is the repeating shotgun manufactured by the above firm. There are about a dozen in use here and the owners appear well pleased with them. I am rather sorry to see them coming into use, as I fear their effect on small game may be akin to that of the repeating rifle on the buffalo.

A few reasonably disposed sportsmen from a distance could find first-class shooting in this vicinity during the months of December, January, and part of February. By "reasonably disposed" I mean those sportsmen who are satisfied with a fair bag to show for a day's outing and will not shoot more game than they can possibly use just for the sake of seeing it drop, nor kick themselves to death if they fail to fill their bag every day they go out. If they feel desirous of trying bigger game they can go further west and hunt train robbers. They are worth $3,000 each to the man that shoots them, which makes them about as big game as can be found in any country.

GUADALUPE.

VICTORIA, Texas, Oct. 24.

SHOOTING NOTES.

GRAY squirrels are very abundant in certain localities in New Jersey this autumn, big bags have been killed in Salem county, and in Warren county the woods are well stocked with them. A good squirrel hunter could go to the vicinity of Waterloo and kill from a dozen to twenty squirrels. Red squirrels are not as numerous in northern New Jersey as they used to be.

Considering the great number of foxes that at this time infest the mountains of northern New Jersey, it is astonishing that there are so many partridges alive in that locality. While a few of the reynards are shot by the local hunters, the foxes have it pretty much their own way, and it is full time a bounty was offered by the townships for their destruction. They are greatly on the increase in both Sussex and Warren county, where rabbits are uncommonly numerous this season. In fact there is excellent rabbit shooting in New Jersey this season, and I am told a sufficient number of big hares in the Catskill Mountains to insure some very jolly and exciting sport. Several years ago I used to go up there every winter and run these big white long-legged fellows with some fast-going hounds. When the snow is on the ground it is a winter sport not to be despised. It necessitates some hard walking, but the novelty and excellence of the shooting was always found to compensate the fatigues and inconveniences of the trip. There is a lot of fun to be had in the Catskills in winter time, and many comfortable places to stop at, with warm fires and good tables.

The full moon has come and gone, but woodcock are still scarce outside of Connecticut. The flight there is nothing to brag of compared to that of some years ago. Big bags were killed last week in New Jersey. One that is reliable was made by Mr. W. Fred. Quimby and his brother on Tuesday last near Mendham, in Morris county. It consisted of ten birds out of fourteen moved. Fifteen years ago the country was a great find in the autumn for longbills, and I remember once seeing a very large bag made in three days by the late William Hinds of Newark, Theodore Tappin of Hanover Neck, W. S. R. Ogilby of Staten Island, and Harvey Day of Mendham. It consisted of some eighty cock, half of which were killed in one day. Besides the woodcock, the party got a lot of partridges and a few quail.

Mr. Frank Dunning, of Florida, Orange county, N. Y., has been killing some woodcock and partridges this autumn. He is well posted as to the grounds and is a very good shot.

Mr. John E. I. Grainger, of this city, has been out several times at Guymard, Orange county, N. Y. Like all the rest of us he found woodcock very scarce. He has killed about a dozen cock and partridges.

Mr. Joseph Earle, owner of the yacht Gracie, has been shooting at Tuxedo Park with fair success. He will try his luck there again this week. Among the other sportsmen at Tuxedo are Mr. John G. Heckscher and Mr. Pierre Lorillard, Jr. The latter is shooting pigeons at this time in his best form. He in a recent shoot for a cup killed 38 hard birds straight: 28 of these were in the ties. It was a remarkably clever performance, and is the talk of Union Club men.

Mr. Howard W. Hayes, of Newark, has been shooting some broadbills in Barnegat Bay. While ducks are not plentiful as yet this season, there are a few black ducks and small ducks trading about, and a few snipe yet left on the marshes.

Mr. Samuel Camp, of rail-shooting fame, writes me from Morristown, N. J., that he has never known more quail than there are at present in South Jersey. He says he can recommend the quail shooting at his place. Mr. Camp is the proprietor of a good hotel.

Wild geese are reported to be very abundant in Stump Lake, Dakota. These combine several varieties: the Canada geese, snow geese and "prairie brant." In California all the different varieties of brant are called "geese." I have shot in Dakota and know about the immense number of fowl there in the autumn, but I must say I never saw geese until I visited Lake Tulare, in California. There the geese roost in the lake, flying from it and back twice a day, early in the morning and late in the afternoon. They feed in the grain fields close to the base of the Sierra Nevadas. When they leave their feeding places, owing to the clear atmosphere, the great flocks can be seen many miles away. Under these conditions more fowl can be seen at one glance than any other place in the world. The fowl, as a rule, are tame, and can be easily killed as they fly over. On foggy mornings the hunters stand on the edge of the tules and have great fun. While a large wagon can be loaded with geese by two men in a day's shoot, there is no way of disposing of the birds. It is impossible to give them away even in the surrounding villages. Shooting, therefore, in this locality ceases to be a legitimate sport, and as the geese cannot be disposed of but few men follow shooting there.

There is some wonderfully good shooting at ducks, ibis and snipe in the lagoons south of Acapulco, Mexico, this season. For some reason the northward flight from South and Central America has been earlier than usual. Sportsmen traveling on the Pacific coast during the next few months would do well to stop over a steamer at Acapulco and try the shooting in the mangroves. My information

is derived from a friend at present residing there, with whom I shot last winter.

While the Czar is having the measles, the German Emperor, Kaiser William, has been enjoying a hunting trip at Count von Stolberg's Wernigerode Castle, familiar on canvas to frequenters of the old "Black Crook." From all accounts the aged sportsman, now in his ninety-second year, had a high old time. In Wernigerode every man and boy plays the drum. After each had prepared the Kaiser for the hunt by playing him a tune, the sport began. Each hunter stood behind a screen of evergreens. The game, which consisted of deer and wild boars, was driven by dogs and beaters through two big gates. It was prevented from heading back by nets and fences. The Emperor faced one of these gates and Prince William the other. They blazed away at the game as fast as their Leibjägers could hand them loaded guns. The Emperor shot in form from away back, and dropped one pig in its tracks. The Kaiser, who is a great shot, fired very often. Finally, when all the cartridges gave out, the hunt ended with twenty-six pigs and deer lying around. That evening the fastnesses of the Hartz Mountains were illuminated with flaming torches, and the Kaiser said he "wanted to go home." Gentlemen in full dress and ladies with bare shoulders came out of the castle and are said to have viewed the dead trophies of the chase. Altogether the hunt was a quaint reminiscence of mediæval times. In this country when people want to see pigs "done up," they step into a Chicago or Jersey City abattoir, which are acknowledged to take the cake in hog killing time.

Several deer are said to have been killed in South Jersey. Some hunters from Cumberland county have killed two in Cape May county, and a party from Philadelphia have shot one.

The farmers of Somerset and Middlesex counties, N. J., have organized a protective society to prevent shooting on their lands this season.

For some weeks past robin shooting has been the rage on Staten Island. Thousands have been shot and brought to this city. THE WISE ACRE.

NEW YORK, Oct. 31.

ARE THEY WORTH THEIR SALT?

PERMIT me to inquire through your columns where, within a few hours' journey of California's metropolis, good wildfowl shooting may be obtained, if not free, then where for a fair remuneration. By "good" I refer more particularly to fowl that, after bagging, are fit to bring to table.

I endeavor, sir, to think and speak fairly of every country or portion of a country in which it may be my privilege to reside: and I was always most emphatically assured that California was *the* place, *par excellence*, for wildfowl, and for a sportsman-naturalist it may be abounding, as I believe it does, in fowl both novel and innumerable. But where, after time and trouble in acquiring specimens of these aforesaid fowl that in other States are found delicious, one finds them (from a culinary point of view) not worth their salt, it causes a man's feelings to yearn toward a land where things are at least what they seem.

To be specific, my complaint is this: That in spite of intelligence in cooking all the specimens of fowl acquired in the vicinity of San Francisco (say from Alameda to Alvarado) have a rank, sedgy, fishy flavor, that totally unfits their ever being rendered a desirable acquisition to the table of those with a knowledge and vivid recollection of the quality and flavor of fowl procurable in adjoining States and Territories.

I am not so narrow-minded as to complain of the absence of many noble game birds in California that are extremely plentiful a few hundred miles north (too far to go often), it is rather of the glittering counterfeits of honest fowl that I complain.

Will some one of your generous (and more fortunate readers) kindly enlighten J. G. B.

SAN FRANCISCO, Cal., Oct. 15.

GAME IN THE PASTURE LOT.

Editor Forest and Stream:

I noticed in last issue of your paper that a gentleman in this State shot 103 woodchucks between April 15 and Oct. 15, and wants to know who can beat it. I cannot beat it in total but in average I can.

Last August I spent a couple of weeks in the Berkshire Hills, Mass., and as I always do, took my rifle, a Ballard .40-63-285. I had only three days while there to try the woodchucks. I started out about 3 o'clock P. M. each day and bagged fourteen, an average of 4⅔. Had I had from April to October to go after "chucks," judging from the number and my usual success, I would not be afraid to challenge our friend for a woodchuck match.

My yearly vacation is usually spent among the Berkshire Hills (my old home), and one of my pleasures is helping the farmers exterminate the woodchucks.

I have a fine Maynard and Ballard, the latter seems to be more effective owing to its large caliber. A woodchuck is not easy to kill and even when mortally wounded is not always secured. It is a good plan to reach into their holes if you do not find them after a shot. I began that practice this year and the result was encouraging, as four out of the lot had jumped into their burrows and had I not tried to reach them I would have counted my shots misses.

I find my .40-63-285 about as effective as anything for woodchucks. Care has to be used as bullets of this size with heavy charge of powder are dangerous to send flying around at random, but when such a bullet hits a "chuck" he is usually demoralized and cannot travel far. I find there are other advantages in using a large caliber. Woodchucks are very shy and they don't allow one to get too near. If you have a rifle that can be depended upon at 150yds., plenty of shots can be had and I find more satisfaction in trying them at a fair distance.

I had quite an experience with a woodchuck this summer. I was walking over the hills on the lookout; a big black fellow ran behind a rock and to satisfy his curiosity peeped around the corner. I could see his head as far back as the eyes, and thought by a carefully shot I might get him. After the shot I ran to find him. He was standing about three feet from his original position and appeared stunned. Upon seeing me he suddenly jumped for his hole between the rocks; but I was too quick for him and got my foot on his hindquarters, holding him fast until I could insert a cartridge in my rifle. I then caught him by the tail and gave him a sudden jerk throwing him about 20ft., and before he could recover himself I had got in the second shot. The first shot had cut away almost the entire upper jaw. That afternoon I shot three that weighed 15lbs. each. W. P. U.

FLIGHT BIRDS IN PIKE.

THE season for flight woodcock in Pike county has been and will be a phenomenal one. The 90°-in-the-shade gunners had the slim bags they merited. Late snow and ice storms played havoc with the nesting birds and the local broods were very slim in numbers. The results of the 4th of July hunting were about thirty-three per cent. of more favorable years, and after the 15th of July the young ruffed grouse had a rest until the fall flight came—the first bunch of birds appeared on Sept. 10—for the most callous of the hunters could not face the gibing that was rife when the announcement was made that so and so was going after summer "woodcock." One result was a fair sprinkling of ruffed grouse when they were legitimate targets. As to fall woodcock ,the third, and probably the final, flight came on Friday, Oct. 28. It was a large one, and the indications are that the birds will remain until Nov. 12 or 13. The second flight, which appeared to be thickest at about Oct. 10, was a glorious one. Here is what a local paper, the Milford *Dispatch*, says about the exploits of two gunners, whose total share of the flight was sixty-two woodcock:

"Who can beat this? In the palmy days of Pike county hunting—more than a decade since—our local sportsmen, more than once in a season, came home with a backload of game. Ed. Quick, Bub and Halstead Wells and others made big records of big bags, notably one of 19 woodcock, killed in two acres of willows near Aunt Mary Van Gorden's in 1876. Such luck is now rare, but on Friday and Saturday George M. Quick, of Shockapee, and G. B. Taylor, of New York, killed to their dogs Shamrock and Joe 24 woodcock and 8 ruffed grouse, 16 of the woodcock falling to their guns on Saturday."

Other sportsmen did equally well. Quick and the writer, without making hard work of their recreation, found it easy to average a dozen head of game—ruffed grouse and woodcock—a day, with plenty of time thrown in for a comfortable lunch, a start with the sun and a ride or walk home by daylight to Quick's hunters' home on the Sawkill, a mile and a half from Milford Village.

Those who like to shoot squirrels will be disappointed this year. There is so much food for them in the woods that they are scattered and there has been no migration from less favored places. There are yet many deer on the range over the Delaware from Carr's Rock to Port Jervis, but there is at least one bear for every deer. Never were signs of bruin so plentiful. There has been a good deal of hounding done already, but only half a dozen deer have been killed, of which at least four were shot in the water, a flagrant violation of the law. Quick does not hound. He will hunt woodcock and grouse for the next fortnight and when the first tracking snow comes he will be prepared to stalk and knows where to look for big game. Rabbits, both gray and white, are legion, and there will be fair quail shooting along the Delaware both on the New Jersey and Pennsylvania side. The Blooming Grove Park Association has increased its territory and is crowding the Greenings and other gentry of "The Farms." What a glorious place Pike county would be were summer woodcock shooting abolished and deer hounding stopped. AMATEUR.

ROADS IN THE NATIONAL PARK.

Editor Forest and Stream:

My attention has just been called to the leading editorial article in your issue for Sept. 15, in which you reflect rather severely and very unjustly on my administration of the roads and bridges in the Yellowstone National Park.

I am not a stranger to newspaper criticism of my official acts, and generally pay no attention to it. Your paper, however, has displayed such an interest in the affairs of the National Park, and has generally stated facts so accurately, and based thereon judgments so sound, that I feel I cannot afford to let your remarks pass uncontroverted.

You say "a hasty and superficial examination of the roads leads to the conclusion that they are by no means so well constructed as were those made under Capt. Kingman's direction." I am surprised that a journal of the high standing of the FOREST AND STREAM would be so very unfair as to condemn the work of a public officer on "a hasty and superficial examination."

Now, I desire to make the following assertions fairly and squarely.

First—The work of the improvement of the Upper Missouri does not occupy almost all my time. During the past summer the Park affairs have occupied most of my time, and I have taken more interest in them than in all the rest of my works combined.

Second—The care and extension of the roads has not been left wholly to my superintendent. I have personally explored by riding or walking over it, in advance, every foot of the ground where roads have been constructed, and have indicated where they were to go, and how they were to be built; and afterward have carefully inspected their construction, and in many instances ordered changes.

Third—My superintendent has not spent most of his time at the Hot Springs Hotel. He has spent most of his time on the road or at the camps of the road parties. The office and headquarters of roads and bridges are at the Mammoth Hot Springs, and this would naturally be the place where the superintendent might be found. He had a team, fast and tough, that could land him anywhere accessible to wheels in six hours. The limit of the range of the working parties was thirty miles from the Hot Springs. Lamartine, the overseer, would doubtless often be seen at the latter some time during the day, and yet on the same day he may have been forty miles away inspecting work. He attended closely to his duties. If your executive officer attends as closely to the interests of your paper as Lamartine does to his work, I congratulate you. Moreover, Lamartine was Captain Kingman's right-hand man, and it was on the latter's recommendation that I made him overseer.

Fourth—The roads built during the past summer are in every respect fully as good as any ever before constructed in the Park over similar ground and out of like soil.

Fifth—More miles of complete road have been built the past summer than have been built heretofore in any one working season.

Sixth—The full force took the field July 1, the day the appropriation became available. This is the first time this has been done.

These assertions are not intended in the slightest degree to reflect on Capt. Kingman. He did very good work—considering his limited means, remarkably good work. I know of no one who could have done better, but he would be the last one to claim that there are no other Engineer officers who can do as well.

Unless my assertions can be disproved I think an apology is due, and I ask you to at least give this letter the same prominence in your journal as was given the editorial in question. Very respectfully,

CLINTON D. SEARS, Captain of Engineers, U.S.A.

UNITED STATES ENGINEER OFFICE, St. Paul, Minn., Oct. 27, 1887

NOTES FROM THE PARK.

YELLOWSTONE NATIONAL PARK, Oct. 10.—*Editor Forest and Stream*: Another season has ended. The association hotels have been turned over to those who will care for them during the long winter months to come. The stages have been withdrawn from the Park and every point of interest looks quiet and deserted. The wild animal can soon travel the roads and trails undisturbed by tourists, excepting a few who do not follow the beaten paths, but seek the Park to enjoy its wonders in solitude. The weather is pleasant, and except for the cold nights this is the best time to visit the Park. No flies, mosquitoes nor gnats.

Only the topographers belonging to the Geological Survey are at the Mammoth Hot Springs; a few days will finish up their work here. Mr. Hague and the geologist of the survey have been at work most of the season to the east and south of the Yellowstone Lake. Mr. Hague has been to the head of the Yellowstone River, where it has its source in an immense snowbank. This is on a very high peak in an amphitheatre near the summit of the mountain; it is over 12,200ft. high, and has at least three large rivers rising in its springs and snowdrifts—the Yellowstone, Buffalo Fork of Snake, and one supposed to be the Gray Bull. This is an unexplored region, only a very few prospectors and trappers have ever been to the head of these streams—they have left no record. Mr. Hague is the first one connected with a survey to have penetrated these wilds; he found good traveling up the Yellowstone in a trail made by elk and other game. He was also at the head of Thoroughfare Creek. This heads in mountains drained on the east by Stinking Water River. In the mountains at the head of the Yellowstone head the south fork of Stinking Water, Gray Bull, Wind River and forks of Snake River, five large rivers, whose exact sources are yet unknown. The country abounds in game of all kinds and the finest mountain scenery in Wyoming. Looking at this country from high mountains to the north, it is but a broken sea of peaks, hundreds of them 9,000 to 12,000ft. high. Its rivers rush through cañon, from 1,000 to 3,000ft. deep. Mr. Hague has returned to Washington more interested in the Park than ever.

The running season for elk has commenced; their whistle can be heard throughout the Park. It is the most exciting sound a hunter can hear. Recently Ed Wilson the scout brought in a man found killing elk in the southern part of the Park. His camp and stock was outside the Park, only his saddle horse and rifle was captured with him. H.

THE GAME CAMPAIGN.

LEXINGTON, Va., Oct. 25.—Saturday, the 15th, dawned clear, dry and warm, perhaps hot were the better word. Nevertheless, many sportsmen were out; but—in consequence of the heat—no good bags were made. Twenty birds, two hares and a mallard constitued the largest of which I have heard. The mallard, a male of this year's brood, was large, fat and juicy. On Thursday, the 20th, we had a fine rain, with lower temperature, which added infinitely to the pleasure and profit of shooting. Birds are unsually well grown, only two coveys of small birds having been flushed so far. On Saturday, the 22d, two of us were out with poor sport until the afternoon, only seven being bagged up to 2 o'clock. After luncheon we entered a field of fine cover and in less than two hours bagged twenty-one; the bag for the day numbering thirty. On the following Monday the same two men out from 1 P. M. to 3:30, at which hour we were driven in by the rain; the bag for the two hours' shooting being seventeen. We two have bagged from Saturday 15th to 24th inclusive, eighty-one. Ducks are flying southward in considerable numbers, heralding colder weather.—T. M. S.

NARCOOSSEE, Fla., Oct. 24.—With the advance of the season quail on being flushed are beginning to fly fast and far; but in spite of it the coveys are getting perceptibly thinned, though there is a fair amount of birds left to give us some good days yet. Cocks are unusually predominant this season; so far we have averaged, as a rule, two males to every hen. Yesterday with four guns we bagged thirty-six and one-half brace, and five couple of doves. The latter being very numerous, gathering in flights of a hundred or more, but uncommonly shy, it is hard to get within range. Driving is the easiest way, and gives one good sport as they come by, being no sluggards in their flight.—GENERAL.

I HAVE a letter from A. B. Smith, High Point, N. C., in which he writes: "Farmers all say there are more quail this season than usual, and of better growth; sportsmen who visit this section can have all the shooting they want." I go to North Carolina on Nov. 6 for two weeks' shooting before the field trials commence. I have written a friend near High Point, on whose lands there are many wild turkeys, asking him not to allow any one to disturb the turkeys until a representative of the FOREST AND STREAM gets there.—GEO. T. LEACH (New York).

CONCORD, N. H.—Partridges (grouse) are scarce here this fall and very few have been shot. One of the best shots around here only killed two woodcock this season. Ducks are as plenty as usual. There are a few teal and pretty fair black-duck shooting all through the marshes along Turkey River, a small tributary of the Merrimac. I have seen but one quail and two or three flocks of snipe and one flock of upland plover.—G. W.

AN ELECTRIC BOAT FOR DUCKS.—Alameda, Cal., Oct. 14.—A friend of mine, somewhat of a sportsman and somewhat of an electrician, is building an electric motor duck boat, in which he proposes to hunt ducks the coming season. His intention is to propel the boat by a small screw propeller jutting outward and slightly downward from behind, while a current sufficient to run the motor is supplied by a series of batteries located in the bow, the wires connecting battery and motor running along under the gunwale of the boat out of sight. The appliance for starting and stopping the motor are of his own invention. As every sportsman is aware great advantage would be gained in a boat of this description, especially when getting up to a large flock of ducks, the great drawback heretofore being the noise of the oars even when muffled; and as all this is obviated in his scheme he hopes to be able to get up to the game. Later on he intends building larger boats for bay excursions and fishing.—S. G. McB.

HYDE PARK, N. Y., Oct. 14.—*Editor Forest and Stream:* I have been out several times with poor luck in woodcock. Country very wet, and birds scattered. Went out on a tramp yesterday and got nothing, my fine dog having taken it into his head to decamp to the happy hunting grounds, and the substitute not amounting to much. A man went out the same day over ground not a mile from me and killed 2 partridges and 16 woodcock. He wounded a woodcock, and a hawk flew down, grabbed it, and went away. Birds are beginning to move.—CAPT. CLAYTON.

THAT there are quail left in Augusta county, Va., is shown by the following note from a friend to Mr. E. S. Young, Division Ticket Agent of the Northern Central Railway Co., at Baltimore: "Staunton, Va., Oct. 18.—Won't you be able to get up this season? You will find game quite plenty. Rhodes killed a fine buck at the Gap last Friday. I brought in 95 quail last Saturday, and won the silver cup given by our District Fair Association with a score of 47 out of a possible 50. Match shot to-day at 2 P. M.—W. F. SUMMERSEN."

CONNECTICUT GAME.—Meriden, Conn., Oct. 31.—*Editor Forest and Stream:* I am more than pleased to read that such men and true sportsmen as Mr. A. C. Collins of Hartford, who expressed his sentiments through the columns of your paper recently, are waking up to the violations of our game law. I am happy to learn that it is doing great good for the bird cause, and it is only by the united efforts of such men that this illegal traffic can be stopped.—J. F. IVES.

Sea and River Fishing.

THE MAINE JIGGING CASE.

ON the 20th of last September we received from a correspondent at Camp Bemis, Rangeley Lakes, Maine, a letter telling us that trout were being jigged at the Upper Dam. "Jigging or hooking a fish on the outside," wrote our informant, "is now openly practiced by men who are old enough to be setting a better example for the many young men and sportsmen now visiting this well-known resort."

The next week, on Sept. 27, we had an interview with a gentleman who had just returned from the Upper Dam. He confirmed the statements of the Camp Bemis correspondent, and told us that he had personally witnessed the jigging of trout at the Upper Dam. He gave us the names of Mr. Mark Hollingsworth, of Boston, and Mr. T. B. Stewart, of New York, as men whom he had there seen engaged in this mode of taking fish.

The same day we received a copy of the Boston *Herald* reporting that the two individuals mentioned had for this offense "agreed to plead guilty before a trial justice at Andover, and they paid $25 and $28 respectively."

When information of such a nature comes to a journal professedly concerned in the correction of abuses and the advancement of angling interests, there is but one course of duty for it to pursue. It may not shrink from exposing the evil and by exposure and censure striving to reform it.

Being satisfied of the entire good faith of our informants, one of them an eye-witness of the fishing, we printed in our issue of Sept. 29 the newspaper report, and made comment on the case in our editorial columns, using the names of Messrs. Hollingsworth and Stewart. Neither one of the gentlemen implicated was personally known by us. Reference to the programme of the last fly-casting tournament of the National Rod and Reel Association showed that Mr. Stewart was one of the vice-presidents of that society of anglers, and in consideration of this fact his reported participation in the practice of trout jigging seemed to call for no uncertain censure. From the words of indorsement which have come to us since the publication of our remarks, we have reason to believe that few anglers who have a regard for legitimate angling methods would dissent from what was said—providing, of course, that the facts were as stated.

The following day Mr. Stewart called at this office to say that so far as Mr. Hollingsworth and himself were concerned, the charge of jigging was groundless; and he expressed himself as deeply aggrieved by the publication. He was invited to make such a disclaimer as he might see fit in the FOREST AND STREAM; and accordingly, on Oct. 5, he brought to us a written statement for publication. This was printed the next day. In it he said:

In your issue of Sept. 28 there appeared an editorial headed "They Jigged Them," which unjustly reflects upon the good names of Mark Hollingsworth, a prosperous and honored citizen of Boston, and myself. It is founded upon a clipping from the Boston *Herald*, which, in turn, is based upon the statements of its Maine correspondent; so, it is a long arm that reaches the real author of the libel.

The gist of the charge is that we were guilty of taking fish at the Upper Dam in a manner prohibited by law and disgraceful to a sportsman; that we were arrested by the fish warden, taken before a justice and fined. I pronounce the charge absolutely false. We were not arrested; did not go before a magistrate, and were not fined; and, above all, we were not guilty of "jigging."

* * * * * * *

I never saw a "jigger," and never called in the "silent-doctor," but from your description I infer it can only be useful in quiet waters and shallow streams; our fishing ground was the rapid and turbulent waters of the dam.

* * * * * * *

Of the nine or ten fish in our possession three were scarred with the hook, and on this simple fact the warden claimed that we were liable to prosecution under the law of that State. Of course, every fisherman knows, and as we stated to the warden, you are liable to bring up a scarred fish, scarred by other fishermen and lost, an every-day and common occurrence.

The warden was obdurate, but suggested that twenty-five dollars be deposited with him. I refused until advised to do so by a gentleman present, of larger experience with fish wardens. My adviser suggested that we would have to travel twenty to forty miles to reach a place where we, strangers, would be unable to give bonds. So we deposited with the warden, but under protest, twenty-five dollars, on condition that he would go with us, at our expense, to the nearest magistrate and enter a complaint against us. I gave him the money and he gave me the following receipt:

UPPER DAM CAMP, Sept. 20, 1887.—Received 25 dollars of T. B. Stewart for violation of fishing. Received as a safety until he goes (Stuart goes) before a magistrate and plead[s] guilty.—GEORGE D. HUNTOON.

Whoever the magistrate may be, please send to me and the part belonging to you will be sent.—GEO. D. HUNTOON, Warden, Rangeley.

We then went to Andover, where the warden consulted with the justice; what advice was given him we do not know; at all events, though we strenuously insisted upon being arrested, he refused to arrest us and refused to return to me the money. He still has it and I have his receipt.

* * * * * * *

The letter embodied this statement signed by Messrs. Jno. R. Ramsey, H. C. Anthony and G. L. Cobb:

We, the undersigned, were present with Messrs. T. B. Stewart, of New York, and Mark Hollingsworth, of Boston, at the Upper Dam, and saw them catch the trout alluded to in the FOREST AND STREAM of Sept. 28, 1887, and we certify on our personal knowledge that these fish were taken in a legitimate manner, and that no fish were taken in any other way.

Modifications of this were also given, signed by Messrs. Simeon Adams, Jno. S. Dowdell, J. C. Billings, D. B. Hempstead, F. H. Chappell and F. A. Whitney, to the effect that the writers had been with Messrs. Hollingsworth and Stewart at the Upper Dam, at the time alluded to, had seen them angling in a legitimate manner, and knew of no trout taken by jigging.

Our comments on Mr. Stewart's letter, in the same issue, Oct. 6, were as follows:

Last week we took occasion to comment upon the capture of trout at the Upper Dam Camp, Maine, by Messrs. T. B. Stewart, of New York, and Mark Hollingsworth, of Boston. Our angling columns to-day contain a communication from Mr. Stewart, advising us that the information upon which our unfavorable comments were based was incorrect. Mr. Stewart states that the trout alluded to were taken in a perfectly legitimate manner, and that he never jigged any fish. If we have made a mistake in accepting the reports which have come to us in relation to this matter, Mr. Stewart has manifestly been placed in a false position by our criticisms, and his disclaimer of the conduct imputed to him will be received with satisfaction by all friends of legitimate angling methods.

It must have been obvious to the most casual reader that this brief paragraph was not to be taken as our final disposition of the matter. Accusations of a grave nature had been preferred against two well-known anglers, and it was clearly the duty of the FOREST AND STREAM either to show that there had been reasonable ground for making the charges, or, failing in this, to make such reparation as might be made by a full and frank avowal of its mistake. No other course would be consistent with our own self-respect, or just to the paper, its readers, or the parties implicated. We accordingly communicated with those who were presumed to have knowledge of the affair, and the statements received in reply to our letters of inquiry are here printed.

The writer of the Camp Bemis letter was Mr. Leonard Atwood, of Philadelphia, a native of the Rangeley Lakes region, who has fished those waters annually from boyhood. Mr. Atwood called at this office Thursday, Oct. 6, and was asked to put in writing the information then given us. His statement is as follows:

PHILADELPHIA, October 10, 1887.—*Editor Forest and Stream:* I make the following statement, in answer to a letter of Mr. T. B. Stewart, published in FOREST AND STREAM of October 6, 1887:

I visited the Upper Dam, Rangeley Lakes, Maine, on Sept. 15 and 16, in company with a gentleman of this city. We arrived at the Dam by steamer from Bemis Stream about 2 o'clock P. M., and went immediately down the steps to one of the piers at the side of the head gates. I found there two men, one of whom I was informed and whom I now believe to be T. B. Stewart; he was on a boat which was fastened to the side of the pier, and about 5ft. below the head gates. The head gate that I refer to is marked A on the accompanying plan, being the southerly one of the group of five gates. Stewart was on the bow of the boat, alone, and was using an ordinary fly-rod, the butt end of which was resting well back toward the stern of the boat. He was using a line not more than 4 or 5ft. in length, the hooks used by him might have been the ordinary fish-hooks, or fly hooks, but were weighted down sufficiently to cause them to sink readily in the water, as it boiled up from the bottom of the gate. The rapid movement of his hand and rod, up and down and sidewise, led me to infer that he was not fishing in the usual way of angling, but was hooking trout upon the outside of the fish or catching them by a process known as jigging. I saw him take one trout on the 15th of September in the manner above described. I again saw him engaged in taking one trout on the afternoon of the 16th of September, and plainly saw him take the hook from the outside of the trout at a point below the gills.

The water at the lower side of the head gate when Stewart was jigging, was not more than 4 or 5ft. deep, the water on the up stream side was in my judgment at least 18 or 20ft. deep. The leakage at the bottom of the gate caused the water below the gate to boil up like a large boiling spring; the water was not feather white, on the contrary it boiled up smooth and glassy. The trout in their endeavors to get up stream, particularly during the spawning season, try to find a passage under these gates; the space being so small as to prevent their passage, they are cut off and obliged to remain in the tail water below the gate. These gates are about 5 or 6ft. in width, and are partitioned off in one group of five gates, one group of ten gates and three large gates, the latter being used for sluicing logs through in the spring. Photograph of gate house and gates herewith submitted. The water in the photograph is shown to be about 4 or 5ft. lower than it was on the 15th or 16th of September.

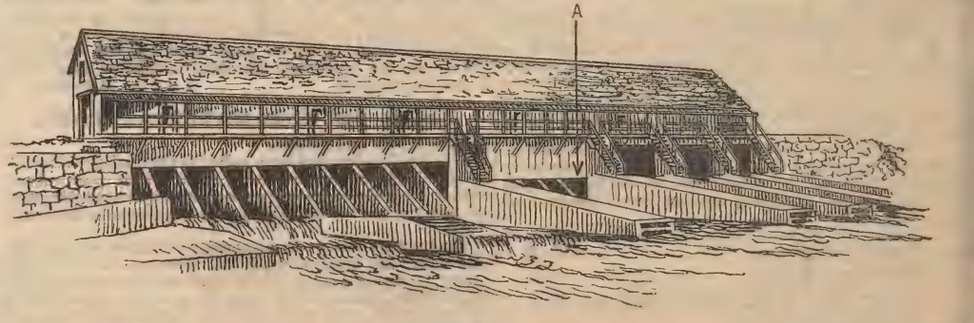
Mr. Stewart was not the only man that I saw engaged in this process of taking fish, but I take his case up separately, as the others have made no public denial of taking trout by this method. I asked a gentleman, while he was engaged in the same process of taking trout at this same time (*i. e.*, Sept. 15), if he was using the silent-doctor, and he nodded his head in the affirmative. I saw trout in a car anchored or fastened to the north pier, which bore evidence of having been jigged. On Sept. 19 I saw a large trout in a car fastened to the same pier which bore unmistakable evidence of a jig-hook, as the side of the trout not only showed the hook mark, but chafing caused by the gut of the hook, which left a large white chafe mark.

I reported what I had seen Stewart and others do by writing to George D. Huntoon, fish warden at Rangeley. I also caused a letter to be sent to the Hon. H. O. Stanley, Commissioner of Fish and Game. I also wrote, under date of Sept. 16, to FOREST AND STREAM, stating in each case that fish were being unlawfully taken at the Upper Dam. I did not use the name of Mr. Stewart in my report at that time. On Sept. 19 I called personally on Mr. Huntoon at Rangeley and stated to him what I had seen and requested him to visit the Upper Dam and verify my statement. He informed me that he would go the next morning and make an examination of the fish and get any further proof of my statement. What transpired between the warden (Mr. Huntoon) and Mr. Stewart I am not able to state, not being present, but I emphatically assert that T. B. Stewart, of New York, was engaged on the afternoons of Sept. 15 and 16 in taking trout by jigging them in the manner and place above described. LEONARD ATWOOD.

Personally appeared before me, the subscriber, a Notary Public for the Commonwealth of Pennsylvania, residing in Philadelphia, the above named Leonard Atwood, who being duly affirmed according to law did depose and say that the facts contained in the above statement are just and true to the best of his knowledge and belief. A. HOWARD RITTER, Notary Public.

To his letter of Sept. 15 Mr. Atwood received this reply from Warden Huntoon:

RANGELEY, Sept. 18, 1887.—MR. ATWOOD—*Dear Sir:* In reply to yours of the 15th, will say I had a letter from a friend saying there were some parties who were jigging trout. I reported it to Stanley; hoping to get a letter from him to-morrow in regard to the matter. You very well know that it would be hard to catch them if they think they were watched. But if you or any one else have seen parties fishing in the manner you say, and will give me the parties' names, I will attend to them surely with pleasure. I wrote Stanley hoping he would send some one from Andover, as I have Kennebago Stream, Cupsuptic Stream and South Bay, also Rangeley Dam, to look after. But if I don't get word from Stanley soon I shall be to the Dam. But if you can give me clue to parties fishing illegal and the names, please do so. A warden gets cursed if he does his duty and if he does not. But if I see myself, or if you give me names and proof, you may surely depend on my looking after them. Yours very truly—GEO. D. HUNTOON.



The game warden, Geo. D. Huntoon, writes from Rangeley, Me., under date of Oct. 15, relating the action taken by him in the affair:

Editor Forest and Stream:

I received word at Rangeley that there was illegal fishing going on at the Upper Dam, and the names of Mr. T. B. Stewart, of New York; Mr. Mark Hollingsworth, of Boston, and Mr. J. Hoyt, of Lynn, Mass., were furnished me as the ones that were doing it. I took a man from Rangeley with me, David Haley, and went there.

On my arrival I found the three gentlemen before named, and accused them of fishing illegally and having fish so taken in their possession. Mr. Hoyt said he had no fish in his possession, as he had sent them out. When I said to him that the law did not allow that, he said that he gave them to a friend who was going out. Mr. Stewart denied having any trout in his possession. He said he had given them to different parties. Mr. Hollingsworth admitted that he had trout in the ice house, and went with me there. Mr. Stewart and William, the man who did the outside work about the house, went along too. When we got to the ice house, Mr. Hollingsworth told William to dig out the trout. This he did, digging them from the sawdust and passing them to me. I wiped the sawdust from them and laid them on a plank. He dug out four fish, and said that that was all there were. I then went to digging and found four more, making eight in all. Three out of the eight had plain hook marks on their sides. Two more had marks in their back fins, which, I was very sure, had been made by a hook, but I could not swear to it. They also had marks in their mouths, which looked very much more as if they were made with the blade of a jack-knife than with a hook.

I proceeded to weigh the trout, thinking there was over 50lbs.,

THE UPPER DAM.

From a photograph by E. R. Starbird. The gate or "stall" on the extreme right of the group of five is indicated by the arrow (A). Four of the stalls are partially shown, the fifth is hidden by the pier.

I asked a gentleman, while he was engaged in the same process of taking trout at this same time (*i. e.*, Sept. 15), if he was using the silent-doctor, and he nodded his head in the affirmative. I saw trout in a car anchored or fastened to the north pier, which bore evidence of having been jigged. On Sept. 19 I saw a large trout in a car fastened to the same pier which bore unmistakable evidence of a jig-hook, as the side of the trout not only showed the hook mark, but chafing caused by the gut of the hook, which left a large white chafe mark.

I reported what I had seen Stewart and others do by writing to George D. Huntoon, fish warden at Rangeley. I also caused a letter to be sent to the Hon. H. O. Stanley, Commissioner of Fish and Game. I also wrote, under date of Sept. 16, to FOREST AND STREAM, stating in each case that fish were being unlawfully taken at the Upper Dam. I did not use the name of Mr. Stewart in my report at that time. What transpired between the warden (Mr. Huntoon) and Mr. Stewart I am not able to state, not being present, but I emphatically assert that T. B. Stewart, of New York, was engaged on the afternoons of Sept. 15 and 16 in taking trout by jigging them in the manner and place above described. LEONARD ATWOOD.

Personally appeared before me, the subscriber, a Notary Public for the Commonwealth of Pennsylvania, residing in Philadelphia, the above named Leonard Atwood, who being duly affirmed according to law did depose and say that the facts contained in the above statement are just and true to the best of his knowledge and belief. A. HOWARD RITTER, Notary Public.

To his letter of Sept. 15 Mr. Atwood received this reply from Warden Huntoon:

RANGELEY, Sept. 18, 1887.—MR. ATWOOD—*Dear Sir:* In reply to yours of the 15th, will say I had a letter from a friend saying there were some parties who were jigging trout. I reported it to Stanley; hoping to get a letter from him to-morrow in regard to the matter. You very well know that it would be hard to catch them if they think they were watched. But if you or any one else have seen parties fishing in the manner you say, and will give me the parties' names, I will attend to them surely with pleasure. I wrote Stanley hoping he would send some one from Andover, as I have Kennebago Stream, Cupsuptic Stream and South Bay, also Rangeley Dam, to look after. But if I don't get word from Stanley soon I shall be to the Dam. But if you can give me clue to parties fishing illegal and the names, please do so. A warden gets cursed if he does his duty and if he does not. But if I see myself, or if you give me names and proof, you may surely depend on my looking after them. Yours very truly—GEO. D. HUNTOON.

The game warden, Geo. D. Huntoon, writes from Rangeley, Me., under date of Oct. 15, relating the action taken by him in the affair:

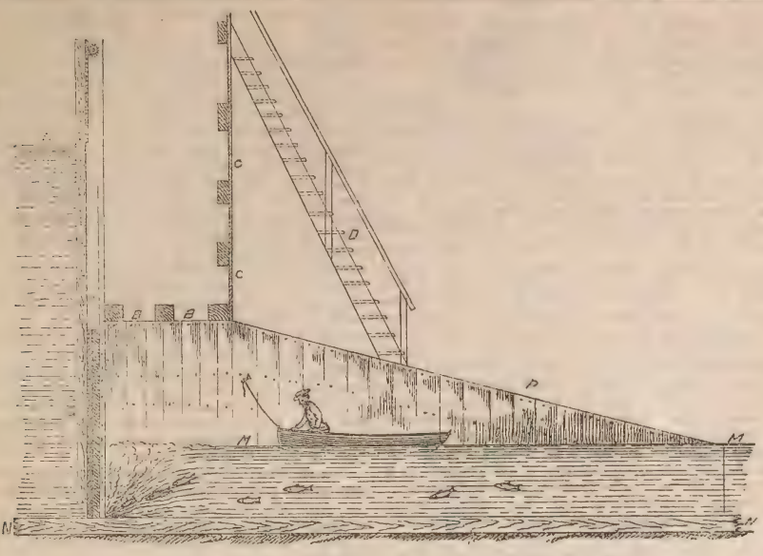
Editor Forest and Stream:

I received word at Rangeley that there was illegal fishing going on at the Upper Dam, and the names of Mr. T. B. Stewart, of New York; Mr. Mark Hollingsworth, of Boston, and Mr. J. Hoyt, of Lynn, Mass., were furnished me as the ones that were doing it. I took a man from Rangeley with me, David Haley, and went there.

On my arrival I found the three gentlemen before named, and accused them of fishing illegally and having fish so taken in their possession. Mr. Hoyt said he had no fish in his possession, as he had sent them out. When I said to him that the law did not allow that, he said that he gave them to a friend who was going out. Mr. Stewart denied having any trout in his possession. He said he had given them to different parties. Mr. Hollingsworth admitted that he had trout in the ice house, and went with me there. Mr. Stewart and William, the man who did the outside work about the house, went along too. When we got to the ice house, Mr. Hollingsworth told William to dig out the trout. This he did, digging them from the sawdust and passing them to me. I wiped the sawdust from them and laid them on a plank. He dug out four fish, and said that that was all there were. I then went to digging and found four more, making eight in all. Three out of the eight had plain hook marks on their sides. Two more had marks in their back fins, which, I was very sure, had been made by a hook, but I could not swear to it. They also had marks in their mouths, which looked very much more as if they were made with the blade of a jack-knife than with a hook.

I proceeded to weigh the trout, thinking there was over 50lbs., the amount allowed by law for one person to have in possession. Mr. Stewart hereupon stepped up and said, "If you are going to weigh these fish, I claim half of them." I said, "You are too late. Mr. Stewart, you have denied having any trout in your possession." He then said, "Half of these trout belong to me; I am as much in for it as Mr. Hollingsworth." I weighed the fish and they weighed 39lbs.; they were dressed.

They then asked me what I was going to do about it. I told them that they would have to pay for them and settle it. They wanted to know how much the fine would be; and I told them not less than $10, nor over $30 for each of them, for the attempt to fish illegally and a dollar apiece for each trout so taken; and three of the lot out of the eight trout I should consider so taken. I told them that this was an aggravated case and their fines, if they went before a justice and were tried, would not be less than $25 apiece, besides the $3 for the three trout which were hooked in the side, making $53 in all. This sum they willingly paid me, agreeing explicitly at the same time to go to Andover with me two days later, plead guilty to the charge of fishing and taking fish illegally. I gave them the following receipts:



UPPER DAM, Sept. 20, 1887.—Received 25 dollars of T. B. Stewart for violation of fishing. Received as a safety until he goes (Stuart goes) before a magistrate and plead[s] guilty.—GEORGE D. HUNTOON.

Whoever the magistrate may be, please send to me and the part belonging to you will be sent.—GEO. D. HUNTOON, Warden, Rangeley.

UPPER DAM, Sept. 20, 1887.—Received of Mark Hollingsworth twenty-eight dollars ($28) for illegal fishing; received as a deposit until he (Hollingsworth) shall go to Andover and plead guilty before a trial justice.—GEORGE D. HUNTOON (Rangeley, Me.).

After I had got through with the trout in the ice house at Upper Dam, I asked them where the car was where they had kept their fish when alive. Mr. Hollingsworth went with me to the car, which was in the water below the dam. I opened it and found a 9lb. trout in it alive. There was a very plain mark of the hook in the throat just back of the gills, and no mark of a hook in the mouth. Mr. Hollingsworth denied having anything to do or knowing anything about this trout.

Two days later I went to Andover with them, they paying my bills down and back as they had previously agreed to do. When we arrived there they both refused to plead guilty, as they had before agreed to do, but said if I arrested them they would give bonds. After they talked together for some time Mr. Stewart took me to one side and said that he did not want to be arrested and did not want to plead guilty. It was not the money that he cared about; it was his reputation; and he told me to keep the money for myself, saying that he would make me a present of it. I told him that would not do; but they had better come up and do as they had agreed to, and if they did not they would be further

SECTIONAL PLAN OF FIFTH "HORSE STALL," SHOWING ELEVATION OF GATES.

A, water level in the dam. *B B*, top of gates. *C C*, line of gate-house wall. *D*, steps leading to pier. *G*, gate. *M M*, smooth water level in "horse stall." *N N*, apron of dam and gates. *P*, pier. *B B* and *C C* extend over the "stall."

dealt with. He said that he would take his chances on it. There the matter stands; for reasons best known to myself I did not arrest them.

About the middle of September, 1886, I found Mr. Stewart fishing at the dam with two large bait hooks on his line, one six or eight inches above the other. On the upper hook he had a minnow, which was hooked on so it would revolve. On the lower hook there was no bait at all. I told him that he had no right by law to fish in this way, and requested him to stop it. GEO. D. HUNTOON.

It appears that Huntoon's course in demanding the amount of the fines was in accordance with the Maine practice in such cases. When a person has been detected in a violation of the game law, or is charged with violating it, the officer may at his discretion, instead of arresting the party, receive from him a sum of money equal to the fine provided, to be held as a surety for the appearance of the individual before a justice, either to stand trial or to plead guilty. If the officer pursues this course, offenders are given the privilege of going before a justice and paying their fines without having been subjected to the indignity of arrest. In reply to an inquiry on this point, Commissioner Stilwell writes as follows:

STATE OF MAINE.—COMMISSION OF FISHERIES AND GAME.—Bangor, Oct. 5.—*Editor Forest and Stream:* As a general rule, an officer is never armed with a warrant unless when looking for a known party who has committed an offense. If while on a tramp through the forest, or on a stream, he detects a man or men in the commission of an offense, he arrests them on the spot, without a warrant, that he may take them before the nearest trial justice and obtain a warrant and trial or commitment. If the men wish to avoid going out under arrest, or wish for time, they can give a bond with a penal sum and sureties. In the wilderness boudsmen are not always accessible, and the warden does precisely what honest Huntoon sought to do and did, viz., he made them deposit in his hands a sum of money equal to the penalty for the offense, gave them a receipt stating the sum deposited and the condition that they were to appear before a trial justice at a certain place and "plead guilty." Not appear for trial, but to plead guilty. Huntoon caught them in the act, and even Mr. Stewart must confess that, according to his own statement, he was *particeps criminis*. Huntoon did not even exact full penalty, which should have been $50 instead of $25 each. The Commissioners have the fullest confidence in the fidelity, integrity and truthfulness of Warden Huntoon.—E. M. STILWELL.

In his conversation with us on Sept. 30 Mr. Stewart mentioned, as among those who had visited the Upper Dam while he was there, Mr. A. N. Cheney, of Glens Falls, N. Y., and Mr. Franklin E. Taylor, of this city. We wrote to Mr. Cheney, and on Monday, Oct. 3, called on Mr. Taylor, who had just returned from Maine. Mr. Taylor told us that while at the Upper Dam he had seen Mr. Hollingsworth fishing in one of the gates of the dam in a manner which left no room for doubt in his mind that the fisherman was trying to take the fish by jigging them. Mr. Taylor is an angler of long experience and a member of the influential Oquossoc Angling Association, whose club house is at Indian Rock.

Mr. Cheney is well-known to readers of the FOREST AND STREAM as an angler and a writer of repute on angling topics. His reply to our inquiry was received on Oct. 4. It read as follows:

GLENS FALLS, N. Y., Oct. 3.—*Editor Forest and Stream:* Your letter asking what I knew about Mr. Stewart's and Mr. Hollingsworth's fishing operations at Upper Dam, Maine, is received. As Mr. Stewart mentioned my name to you as one of the anglers who were at Upper Dam while he was there, I take it that he is not averse to my explaining to you what I then learned.

I was at Upper Dam while Mr. Stewart was there, and I left Upper Dam most thoroughly disgusted with the manner in which big trout are potted at that place.

On the evening of Sept. 14, Mr. W. D. Cleveland, Rev. Mr. Beckwith, both of Houston, Texas, and myself arrived at Upper Dam on our way home from John Danforth's camp at Parmacheene Lake. Among others at the Upper Dam hotel were Mr. Stewart and Mr. Hollingsworth. Mr. Cleveland was anxious to get a big trout to bring out and show to his friends, and offered to buy such a fish if it could be had for money. Failing in this he accepted as a gift from Hollingsworth a trout that he had alive in a fish car. This fact, that a member of the party with whom I was had accepted a fish from Mr. Hollingsworth, made me loath to criticise the peculiar style of fishing of Mr. Stewart and Mr. Hollingsworth, for if my informant is correct, which I do not doubt, this peculiar style is what I was brought up to call "jigging."

After our arrival and during the evening, Mr. Stewart, in reply to Mr. Cleveland, said the big trout were taken with a fly. Later in the evening Mr. Freeland Howe, of Norway, Me., intimated to me that the big trout were not even taken with bait; but he was then quite careful not to commit himself as to the exact manner of their taking off, although he told me that if I was near the "horse stalls" in the morning I might see how the thing was done.

In the middle of the dam the water issues from four or five gates, when they are open, and the gates are separated by partitions, making openings on the lower side, say about 5ft. wide and 12ft. long, with a wooden floor not unlike horse stalls in a stable; hence the name which is applied to these death traps. The water in the stalls, which are four or five in number, was at the time I inspected them, I judged, about 2ft. deep. On either side of these stalls are narrow inclines of woodwork, running from the dam structure down into the water. Some distance above the water the structure hangs partly over the stalls. Beyond the incline, at either side, water issues from other gates on a higher level than in the stalls, and runs down over aprons to the pool below. The leakage from the side gates causes a current to set up into the horse stalls between. The pool is 75 to 100ft. down stream from the stalls. You will see from my rough description that if a trout runs from the pool up into one of these stalls there is no way for it to get out except to return the way it came, and you know that in September trout show great determination to get up stream at any cost, and when once in the stalls they are not easily turned back.

At 5 o'clock on the morning of the 15th Mr. Cleveland and I went on the water below the dam, where there were several other boats, and cast our flies in the pool and river. When the fog lifted we saw that Mr. Stewart's boat was in one of the "horse stalls," and there he remained until he went to breakfast, two hours later. His fishing seemed to be done by peering into the water over the side of his boat, and I was curious to know what his actions meant. After breakfast time all the fishermen except Mr. Cleveland and myself went ashore, and then we pushed our boat into the stall at the extreme right, just vacated by Mr. Stewart, and found it as I have described above. We both pronounced it a death trap for any trout which might get in there and be jigged for.

One angler, a clergyman, had a guide, and the two went into the stall at the far left and remained for a short before the guide put his employer on shore. The guide returned at once alone to the stall and was there when we arrived. As we pushed out of the right hand stall, after looking it over, the guide in the left stall was seen to be fast to a trout and he motioned to us to wait. His fish soon ran down into the pool, and there he "played it," and finally made several ineffectual attempts to net it. I called to him that I would help him; and while pushing my boat toward his I asked Mr. Cleveland to let me see the trout after he had netted it and before passing it over to its owner. Mr. Cleveland put my net under the trout and swung it around into the boat in front of me, when we saw that the trout was hooked under the tail with a bare hook of large size, without even an apology for a bait of any kind. The guide said he was fishing with bait, but I should imagine that when trout seize a bait with the "tail holt" they would not swallow the bait. To me it seems absurd to expect a trout in one of these stalls in September to take either fly or bait except under the tail. At the breakfast table we informed the gentleman that his guide had taken a trout in the stall and he informed us that before coming in he had seen two trout in the same stall. After breakfast we found that the guide had taken the second trout, so both were accounted for.

I went with others on the footway of the dam after breakfast to see the water let on from one of the gates (I will speak of this later), and looking down into the stalls saw Mr. Hollingsworth fishing with what appeared to my eye to be a bare hook with a fly fastened to the leader just above it. Later I was told by Mr. Howe that I had hit the tackle exactly. Mr. Hollingsworth was jerking his rod and short line as a man does who is trying to jig trout. While I was getting ready to start on the steamboat, Mr. Hollingsworth came down into the pool from his stall fast to a big trout. I watched the struggle for a few moments from the hotel, but the fish escaped. Later, while talking with Mr. Hollingsworth on the dam, he said as if in apology for his style of pot-fishing, "I did not think I ever would engage in this, for it is not very sportsmanlike, still it is exciting once a trout is hooked." He left me to translate "this" according to the knowledge that I might have gained.

The same morning Mr. Stewart caused the water to be let on from one of the gates (not one of the horse stall gates, for that would disturb the "preserve," but a flanking one) to "stir up the trout in the pool" below. He then announced that it would be a good time to fish above the dam with bait, prepared himself accordingly, and quietly took himself to one of the stalls *below* the dam. I think that any one who understands the habits of trout will surmise that the water was let on to create a current to draw the trout, strong with the breeding instinct, up stream in the hopes of finding an outlet to spawning grounds. Of course, when they were "stirred up" and came into the stalls they were in a pen, so to speak. Mr. Stewart fished in the stalls before and after breakfast, but I did not see him fish the pool or stream below while we were there.

When we left on the steamer for Middle Dam Mr. Freeland Howe came with us, and we talked of the fish murder going on at Upper Dam. Mr. Howe then told Mr. Cleveland and me that Mr. Stewart took trout out of those stalls by hooking them foul on the outside, and that he, Mr. Howe, sat in Mr. Stewart's boat and saw him do it. You may call it jigging or hooking or whatever you choose. Mr. Howe said that a bare hook or fly, or both, were used, and the trout were first seen in the stalls, and then with the line shortened on the rod they were hooked at until the fly or hook fastened them somewhere. Sometimes the fly hooked the trout, sometimes the bare hook did it; but the dead minnows seen in Mr. Stewart's boat were only a blind. Mr. Howe made the above statement without reservation or pledge. I carefully made a memorandum of what he said and read it to Mr. Cleveland, who will confirm the accuracy of it if you wish. A. N. CHENEY.

On Oct. 5, the day following the receipt of the above, when Mr. Stewart brought us his disclaimer, he told us that Mr. Howe was one of those to whom he had sent for signature the statement signed by Mr. Ramsey and others. We then wrote to Mr. Howe as follows:

"We have been told that you have personal knowledge of the trout fishing methods employed by Mr. T. B. Stewart, of this city, at the Upper Dam Camp, Me., having been with him when he caught trout. The FOREST AND STREAM has accused Mr. Stewart of having jigged trout, *i. e.*, caught them by striking a fish hook into them somewhere in the body other than the mouth. Mr. Stewart denies having taken fish in this way, but claims always to have taken them in a perfectly legitimate and sportsmanlike manner. Our only desire is to get at the truth in the matter, and if we find that we have wronged Mr. Stewart we will gladly do him justice by saying so. Will you kindly tell us whether we have made a mistake or not?"

To this in due time came the reply:

NORWAY, Me., Oct. 10.—*Editor Forest and Stream:* Your favor of the 5th is received, and I have seen the correspondence by Mr. Stewart, and I beg leave to be excused from saying anything upon the subject.—FREELAND HOWE.

Capt. Fred. C. Barker writes as follows:

CAMP BEMIS, Me., Oct. 15.—*Editor Forest and Stream:* In reply to your note inquiring about the reported illegal fishing at the Upper Dam, Maine, in September last, by Mr. T. B. Stewart of your city and Mr. Mark Hollingsworth, of Boston, I will state that I have never seen Mr. Hollingsworth fish otherwise than fairly; but of Mr. Stewart I cannot say the same. On the afternoon of the 15th or 16th of September last, in one of the deep gates of the Upper Dam, or rather just below the gate in the compartment in which the gate stands, which is planked on the sides and bottom, and covered over head by the bridge of the dam, making a space about 18ft. long or deep, 7ft. wide, and 15ft. high, with the water about 4ft. deep, I saw Mr. Stewart fishing from a boat, which was hitched to a spike driven into a plank on the side and near the mouth of the compartment. The bottom could not be seen, as there was quite a current in the water, owing to the gate being hoisted a little. Mr. Stewart had an ordinary fishing rod and was fishing up near the gate. He drew his tackle from the water and dropped it back again as many as three times while I stood within eight feet of him, and I plainly saw two ordinary-sized bait hooks attached to his leader, one six or eight inches above the other. Neither one of the hooks was baited. He was yanking these hooks up and sideways, the same as one would yank a grapple through a sucker pool, where the bottom could not be seen. I don't know that he called that jigging, or an attempt to jig; perhaps he has not the word in his fishing vocabulary; but it could not be called fishing by the "ordinary mode of angling." I did not see him hook a fish, but I was told by two or three persons that he hooked one very soon after I went away, but whether in the side or the mouth I did not learn. Just before Mr. Stewart went to fishing there, a gentleman came from the same place leading a large trout. The fisherman was standing up in his boat with his rod in his left hand, and the trout led like a horse. In his right hand he held the oar with which he paddled the boat along. There was plenty of room to take the trout in just below the apron of the dam, in sight of perhaps a dozen ladies and gentlemen who were standing on the bridge of the dam; but after a turn or two in the pool, he paddled up to a pier of the dam; a friend of his stepped in, took the oars and rowed about ten rods away from the dam; the boat stopped, side toward the dam; the fish was brought up on the opposite side, and the landing net was slipped under him. Perhaps the hook was in the right place; no one but the fisherman and his friend saw where it was.

F. C. BARKER.

What is to be understood as a "jig" and as "jigging" in this connection must depend upon the words as they were employed in our article of Sept. 29. The explanation then given was this:

The jig is a very simple implement. It consists of a hook or a number of hooks attached to a pole or to a line with or without a rod. That is all there is to it; no bait, no fly, nothing but just bare hook. This is let down into the water underneath the fish or by the side of it, and jerked upward or sidewise. The hook is driven into the fish's belly or side or head or tail, and there you have him!—FOREST AND STREAM, Sept. 29.

The correspondent who first alluded to the trout shown in Boston has thus replied to our inquiries:

Editor Forest and Stream:

So far as Mr. T. B. Stewart's big trout are concerned, I do not feel that it would be just to myself or to the readers of FOREST AND STREAM to let the matter drop without explaining my position, since I wrote the account of the trout in the show window, the same that were treated editorially in the number of that paper issued Sept. 29. I have not the slightest ill-feeling toward Mr. Stewart, and I would not do him even the smallest injustice.

The first intimation I had that the fish were taken in any other manner than the one I reported to you, came in this letter from Mr. Stanley:

"STATE OF MAINE, COMMISSION OF FISHERIES AND GAME.—Dixfield, Me., Sept. 28.—*Friend* ——: I notice an article of yours in FOREST AND STREAM, under date Sept. 15, entitled 'Maine Waters.' In the article is mentioned Mr. T. B. Stewart, of New York, as a very successful fly-fisher at the Upper Dam for large trout. Now, a few days ago I got several letters from sportsmen at the Upper Dam saying that parties were hooking the large trout on the way to their spawning beds, at the Upper Dam, by means of two or three hooks one above the other. I wrote George D. Huntoon, our warden at Rangeley, to go down there at once and catch them if he could. He did so, and caught T. B. Stewart, of New York, and a man from Boston by the name of Hollingsworth. They acknowledged the offense; and they deposited with Huntoon $75, he giving them a receipt therefor, and they agreeing to meet him at Andover last Friday, plead guilty, and settle the case. When they got out to Andover, they declined to plead guilty, but wanted him to keep the money and say nothing more about it. He would not arrest them at Andover, as he did not have the evidence, etc., that he could get at. * * * I recollected the article of yours I saw in the FOREST AND STREAM, and thought I would write you the particulars, as I get them from good authority.—HENRY O. STANLEY."

The day after receiving this letter the FOREST AND STREAM of Sept. 29 came to hand, containing your editorial comments, in which you said the fish had been jigged.

In my account of these trout I stated that they were caught with a fly. I also congratulated Mr. Stewart on his success as a fly-fisherman at the Upper Dam, at which celebrated fishing resort I have been well aware of his being a good part of several trouting seasons. I have always, till within a couple of seasons, heard him spoken of as a fly-fisherman, one who would not care to stoop to taking a trout with a worm even. I am quite sure that I have heard Mr. Stewart declaim against the practice of taking trout by any other means than with the fly. What I said in the FOREST AND STREAM about Mr. Stewart's taking those show window trout with the fly, I said because the story of honorable gentlemen to me was to the effect that they were taken with the fly. Mr. Appleton, of the firm of Appleton & Litchfield, owners of the show window where the trout were when I saw them, told me that they were taken with the fly. Mr. Appleton says that he understood it distinctly from Mr. Stewart himself that the trout were taken on the fly, and even the name of the particular fly was mentioned. Mr. Appleton also says that the trout were entire when he showed them in his window; for he dressed them himself, and he is sure that there were no marks of hooks on the fish. The large trout caught by Mr. Hollingsworth was handled by Mr. B. F. Nichols, of split-bamboo rod fame. He made a plaster cast of the fish. This fish was minus the intestines and gills when it came under the hands of Mr. Nichols; he saw no marks of hooks. So much for the fish as they appeared in Boston. Mr. Stewart says, in his disclaimer in the FOREST AND STREAM, or rather brings the written statement of witnesses to show that they were caught in "a perfectly legitimate manner." But just what this manner of fishing was Mr. Stewart does not state, neither do his witnesses. The section of the Maine law bearing on this, reads:

Sec. 51. Whoever at any time catches, takes, kills or fishes for any sea salmon or landlocked salmon, trout, togue, black bass, Oswego bass or white perch, by means of grapnel, spear, trawl, weir, net, seine, trap, spoon, set line, or with any device or in any other way than by the ordinary mode of angling with a single-baited hook and line, or with artificial flies, forfeits not less than ten nor more than thirty dollars for each offense, besides one dollar for each fish so caught, taken or killed. And all set lines, grapnels, spears, trawls, weirs, nets, seines, traps, spoons and devices other than fair angling as aforesaid, are prohibited in all fresh-water lakes, ponds and streams; and when found in use or operation in said waters, they are forfeit and contraband, and any person finding them in use therein may destroy them.

But there were other witness to the fishing of Mr. Stewart than those who have given their written statements. Some of them were gentlemen whose word is unquestionable. Col. Nutt, president of the Atlantic & Pacific Railroad, saw him fishing. Mr. J. Parker Whitney, well-known as the owner of the beautiful Musquito Brook camps, saw him fishing at the Upper Dam more than once. Mr. Freeland Howe, of Norway, Me., a sportsman well-known in these regions, saw him fishing there. I have understood that Mr. Howe now declines to make a statement, though at first expressing considerable indignation at the way fishing was being done there. But the testimony is amply sufficient to prove that Mr. Stewart fished otherwise than with the fly in the usual manner, and to show that my former statement in the FOREST AND STREAM, that Mr. Stewart is a devotee of fly-fishing only, admits of some question.

Col. Nutt says that he has seen Mr. Stewart fishing under conditions that would hardly indicate fair angling with a fly, though he never saw him actually take a trout with a jig. Col. Nutt says: "One occasion I especially remember. Mr. Whitney, whose guest I was at the time at his camp at Musquito Brook, and I went one afternoon to the Dam to try our success with the fly. It was in September last, about the time there was so much excitement about Stewart's big trout. Mr. Whitney was casting a fly below the Dam, but I was not fishing, only watching him and admiring his casting. Mr. Stewart was fishing at the raceway in his boat. I don't know as he saw us. The water was making a good deal of noise and he certainly could not have heard us. Mr. Stewart was near enough for me to recognize him, but neither of us spoke, if, indeed, he saw me at all. His boat was propelled up into the

'horse stalls,' as I term the flume ways where Mr. Stewart and others have done so much of their fishing—not a very good place to cast a fly at least. I am not sure that Mr. Stewart had any rod in his boat at all; certainly not a very long one. He went to peering very earnestly down over the side of his boat into the water, and I saw him working about with his hands and bobbing as though jigging with a hand line. He staid in there something more than half an hour, and as soon as he left somebody else took his place. They seemed to be taking turns at that kind of fishing in the 'horse stalls.' I want none of it, but it evidently suited Mr. Stewart and the crowd of sportsmen at the Upper Dam at the time immensely, by the way they followed it up. I am under the impression that some of the very persons who declare that Stewart's trout were caught in a perfectly legitimate way, were among the persons that indulged in this style of fishing in that flume way. I did see men fishing with great hunks of spawn, in netting, half as big as my fist. I have nothing against Mr. Stewart, but the kind of fishing that was carried on at the Upper Dam this fall I do object to, and I hope a stop may be put to it, as it destroys the sport that actually belongs to other fishermen."

Mr. J. Parker Whitney, who has owned and occupied his elegant camps at Musquito Brook, four miles down the lake from the Upper Dam, for more than 25 years, also saw Mr. Stewart fishing at the time mentioned by Col. Nutt. Mr. Whitney has not given me permission to use his name, but he has said to me, that though he never saw Mr. Stewart take a trout with a jig, he has seen him repeatedly fishing over the side of his boat, down on his knees or stooping very low, and peering earnestly in the water. Mr. Whitney also expresses a good deal of indignation at the way fishing has been going on at the Upper Dam the past season or two. He says that he believes that the poor fly-fishing there this season is the primary result of the fishing from the spawning beds at that point, and that the secondary result will be the depletion of trout in the lake below. Mr. Whitney is one of the foremost fly-fishermen in the country. He is an ardent lover of the sport. He has discharged guides, in one or two instances, whom he found with jigged trout in their possession. It is related of him that he rowed one night four miles, to the mouth of Metallic Brook, for the sake of turning loose a car of trout some miserable fishermen had left there to die. He is a man of ample means, and might have called upon any of his half dozen guides to do the work, but he preferred to do it himself, because he could do it quietly and no ill feeling would be created.

Mr. Herbert Kempton, of the Boston *Herald* editorial staff, says that he saw Mr. Stewart, in the fall of 1886, fishing over the side of his boat at the Upper Dam. He was peering down into the water. He had only a hand line, or a line on a rod so short that it was not noticeable at a distance of a few rods.

But the curious feature of the whole case is that Mr. Stewart and Mr. Hollingsworth were not arrested. The justice at Andover wrote me as follows:

"ANDOVER, Me., Oct. 17.—*Dear Sir:* Yours of 11th did not reach me until Saturday night, hence delay in reply. I replied to yours of 6th, wherein I stated all I knew about the matter, but should infer by yours of 11th that you did not receive it. The parties you mention came before me on 22d ult., and said they did not plead guilty to the charge of jigging at the Upper Dam, but had paid George D. Huntoon, fish warden, $53 (Huntoon said for said offense); and why they were not arrested is certainly no fault of my own. But if you will write George D. Huntoon, Rangeley, Franklin county, Me., he will give his reasons for not making the arrest. If they are guilty of violating a law they can be arrested at any time and held to answer for the same and punished if proof can be obtained. Shall be pleased to hear from you in relation to this matter any time.—C. A. ANDREWS."

When in Andover I attempted to find Justice Andrews, but he was away. One story told at Andover is that the justice did not have the requisite blanks and that the warden applied to another lawyer to furnish them, but that in the interim Messrs. Stewart and Hollingsworth had engaged this lawyer as counsel, and of course he would not let the justice have the blanks. There were no other blanks nearer than 20 miles. SPECIAL.

In their certificate Messrs. Adams and Dowdell testified directly as to the trout shown in Boston; but in the certificate signed by Messrs. Ramsey, Anthony, Cobb and Billings, those gentlemen testify to having seen Mr. Stewart and Mr. Hollingsworth catch in a legitimate manner "the trout alluded to" in the FOREST AND STREAM of Sept. 29. The "trout alluded to" were of two lots, first those shown in Boston, and second those examined by the warden and by him pronounced to have been jigged. The trout shown in Boston were, we are told, fish from two lots of the lawful weight of 50lbs. each taken to that city by Messrs. Stewart and Hollingsworth from the Upper Dam, 30lbs. being left behind; and the second fish, said to have been jigged, were of another lot of eight found in the ice house when the warden made his search. It appears from this that an extraordinary number of trout—extraordinary for the time and place—were taken at the Upper Dam by Messrs. Stewart and Hollingsworth. With a view to identify the fish certified to in their signed statement, we have addressed notes of inquiry to the gentlemen named, but have as yet received only these two replies:

WOBURN, Mass., Oct. 17.—*Editor Forest and Stream:* In answer to yours of the 15th, I would say that my knowledge of the trout caught by Mr. Stewart relates to the fish taken at the Upper Dam, Rangeley Lake, and it was in relation to these fish that I made affidavit. As to whether they were the same fish that were on exhibition in Boston I am unable to state absolutely, as I did not see the fish while on exhibition, but I have reason to think that they were the same fish.—G. L. COBB.

BETHEL, Me., Oct. 18.—*Editor Forest and Stream:* Yours received, and in reply will say I did not see the trout that were on exhibition in Boston. I will say, however, that I was with Mr. Stewart at the Upper Dam several days, and I know that the trout he caught while I was there he caught in a lawful manner. I stood within 10ft. of Mr. Stewart and saw him catch a dozen or more trout at different times, weighing from 4lbs. to 8lbs., and I know he only used one hook, sometimes with bait and sometimes with fly. The water where he caught the most of his fish is very quick and is boiling, so that no living man could jig a trout or even see one, unless the trout came to the surface.—J. C. BILLINGS.

This comprises the correspondence received by us for publication. Letters addressed to several other parties, to whom we had been referred by Mr. Stewart and others, have elicited no response. Additional evidence that trout jigging was practiced at the Upper Dam has been given us verbally, but on condition that the names of our informants should not be used.

The testimony is published as it has come to us. In it we find nothing to call for a modification of our editorial remarks of Sept. 29, except in the following particulars: (1) The evidence here presented does not show that the two trout exhibited in Boston were among the large trout which were jigged at the Upper Dam. (2) The trout jigging at the Upper Dam was not done on the spawning beds, as our remarks intimated, but in the "horse stalls" of the dam. (3) Messrs. Hollingsworth and Stewart did not plead guilty before an Andover justice, but they paid the stated sums to the game warden before going to Andover; their reason for paying the money is left to be inferred from the tenor of the receipt and from the statement of Mr. Stewart and that of Warden Huntoon as printed above. These modifications are for the most part on points which are immaterial. Beyond them the case is shown to be essentially as we stated it in the issue referred to.

The evidence, so far as gathered, proves that trout were jigged at the Upper Dam, and that Messrs. Hollingsworth and Stewart took part in the jigging.

As we have said before: "The jigging abuse is of long standing, and the time has come when an end should be put to it at once and for all." If the discussion of this case shall aid in the attainment of that end, the amount of space we have given to the subject will be justified.

TROUTING ON THE PASSADUMKEAG.

WHOEVER enjoys trout fishing should not fail to visit the Passadumkeag region, Maine. Any time between June and October will be in season for the best kind of sport, either with the fly or baited hook.

My first trip to that region was in 1867, in company with five other sportsmen. We left Bangor the first day of June, at 8 o'clock in the evening, taking the European & North American express to Enfield, where we arrived at half-past 9. There we found Pettengill, whom we had previously engaged to take us across the country to Pettengill's Landing, about twenty miles distant.

Our team was a heavy three-seated, thorough-brace wagon, drawn by a pair of large gray horses. We passed through Lowell and Burlington, then entered an unbroken forest of nine miles, reaching Pettengill's farm, two miles from the landing, at 4 o'clock A. M. Here we took a rest of three hours, after which we refreshed the inner man, and while our host was looking up the oxen we transferred our luggage from the wagon to the ox sled, to be taken down to the landing, two miles distant. The road from the farm being only used in winter, was very rough; indeed, we had to cut away many fallen trees before the team could get through. We reached the landing after four hours' hard work. It was the first party ever known to visit that region for trout fishing. The Passadumkeag is, at low water, from 40 to 60yds. in width, but at this season its banks are full, and the roar of the water as it ran over Grand Falls, two miles below, was tremendous.

Here we caught our first trout, and they were beauties too. We found the gray and yellow hackle to be the most enticing bait. We took ten in about twenty minutes, averaging 1¼lbs. each. Our guides, Pettengill and Lord, soon had them dressed and done to a rich brown. When dinner was announced, there was no need of a second call, five of us were there simultaneously. Our guides, although hungry themselves, refused to eat until all were well helped. Trout after trout disappeared, until the Doctor ordered a halt for consultation, and as he had secured the last trout from the frying-pan it was unanimously decided that we must either stay proceedings or catch more trout. The vote to stay proceedings until we arrived at the camping ground three miles up the river prevailed, and packing our outfit into bateaux we proceeded up the river to the mouth of the Nickatous, and pitched our tent on the west end of a horseback which divides the two rivers and runs nearly parallel with them for some four miles.

Just in front of our tent was an immense granite boulder overhanging the river, which at this point is very deep. Along the banks of the river on the side next to our camp were numerous springs of ice cold water, here the trout seemed to congregate. Never shall I forget the sensation as we cast our first flies. The water seemed literally alive with trout, and after a few casts we stripped our leaders of all but one fly, lest in the excitement of the sport we should catch more than we could use.

The basin at the mouth of the Nickatous, twenty-five rods below us, is also a favorite resort for trout, here in 1873 I landed at one cast two trout weighing 7¼lbs., one of them, 5⅜lbs., was the largest I have ever known to be taken from these waters. While we were enjoying an hour's fishing our guides had pitched our tent, covering the ground with a thick carpet of fragrant meadow hay taken from a stack near by, cooked trout for supper, and we then partook of our first meal in camp.

Our table was rustic in the extreme, being made of cedar splints laid on poles and supported by crotched sticks driven into the ground, but it served our purpose well enough, our appetites were sharpened by the invigorating air of the forest.

We had agreed to catch only what fish we needed to eat while in camp. We had fished less than one hour, and after we had finished supper we found we had twenty-three trout still remaining. These we dressed and laid in a large basket made of birch bark and carried back some twenty rods from the camp, and set them over a cool spring which flowed from the side of the horseback.

The Doctor looked glum, the fact that we could do no more fishing until these were disposed of weighed heavily on his mind. Fortune (or at least bruin) favored us, for on visiting our basket the next morning we found it empty; the tracks in the soft ground plainly indicated that they had been appropriated by a bear, and a big one, too. We gave three cheers for the bear and hoped he would call round again when we had a surplus of trout, which he did not do, however.

The second day we divided our party, part going further up the Passadumkeag, myself and two comrades, with Lord as guide, going up the Nickatous, intending to go as far as the falls, some six miles up, but on reaching the timber we came to a rocky tumbling stream, which Lord informed us was the Pistol, the outlet of a chain of lakes some three miles above. The view up the Pistol from our boat resting at its mouth was grand, the stately forest on either side, the huge boulders lying in every direction, the water foaming and dashing past them and forming into deep eddies afforded most enticing lurking places for trout.

We decided to land here and explore this stream to the headwaters, so drawing our boat well up on the south bank we proceeded to try the trout in the first eddy at the mouth of the Pistol. Our first cast proved our predictions to be true; we each landed a fine trout weighing about three pounds. These we turned over to Lord and proceeded up the stream, only occasionally stopping to make a cast, which invariably proved the stream to be literally alive with trout. After following up stream for half a mile or so, myself and Heald decided to take a trail which we found a little way back from the south side of the stream, concluding that it led to the lakes, leaving Hunter and Lord to follow up the stream and intersect us at the outlet of the lower Pistol lake. We loitered along for an hour or more enjoying the strange wild scenery and wondering at the strange stillness, when suddenly we heard way off up the trail a growl that dispelled our reveries, and nearly paralyzed us for a moment. The growl was repeated at frequent intervals, and we thought we could distinguish a human voice. Thinking our comrades must have been assailed by some savage beast (although unarmed, save a hatchet and hunting knife) we rushed forward to the rescue. As we approached the snarls and growls became more frequent, and the voice more distinct; we distinguished words which sounded like "Oost yer black varmint." Just as we were rounding a bend in the trail we heard two shots in rapid succession, followed by a gruff voice saying, "Thar, darn yer picter, yer miserable varmint, yer wanted me ter drag yer out didn't yer." Arriving at the spot we found a dead bear and an old man trying to remove a heavy trap from the bear's foot. The old hunter at first seemed disinclined to be communicative, but after assisting him to remove the trap and drag the bear out a little further into the trail we elicited from him the facts concerning the outcries we had heard. He had trapped the bear some rods from the trail and had probably been in the trap several days or until, as he expressed it, "the varmint had been caught long enough to become suple." He wanted to get him out to the road (before killing) and had driven him as one would drive a pig. To the trap was attached a heavy wooden clog, which catching in the brush from time to time would make the bear cry out with rage and pain, and by the time they had got to the trail both man and bear were thoroughly exasperated. He had attempted to kill him with his axe, but on coming near enough he showed so much fight that he was obliged to settle him with a couple of shots from his old gun, the stock of which was tied on with rope yarn and wire. We judged the bear weighed about 400lbs. We secured some of his claws as trophies and proceeded on to the headwaters of the Pistol. We found Hunter and Hall already there; Hunter had just struck a large trout, which engaged our attention for some thirty minutes.

Lower Pistol Lake is two and one half miles in length and about one mile wide. On the south side and extending out into the lake, half a mile or more, are hundreds of huge granite boulders reaching above the surface, the north and west sides are bordered by high bluffs of granite.

These lakes with the Nickatous, four miles above, are favorite resorts for deer; we saw one noble buck with large spreading antlers (now just in the velvet) quietly nipping the lily pads near the outlet and about forty rods from us. He fed on and allowed us to look at him with apparent unconcern for several minutes. At last, raising his head and sniffing the air, with a loud snort bounded away up the rocky shore and out of sight.

Sportsmen from Boston and New York now make annual visits to this region. Most of them are entertained by our old friend Joe Darling, whose camps on the Nicktous are noted for their luxurious appointment.

At 2 o'clock our guide invited our attention to a dinner of boiled trout, hardtack and hot coffee. Our table was a broad, flat stone close to the water, and shaded by the branches of an immense oak. After dinner we took an inventory of our luggage and found we had 34lbs. of trout to carry to camp. On our return we found in a ravine near where we left our boat a considerable quantity of clear blue ice. With our hatchet and knives we soon broke off as much as we could carry in the boat to camp, which we reached just at sunset. As our friends had not yet returned from up the river, we set to work getting together some dry logs for our evening camp-fire, while Lord prepared supper. Just as the shades of evening began to deepen around our camp we heard the voices of our comrades in jubilant tones far up the river. As they approached we concluded that something quite unusual had elated them, and as they reached the camp landing we saw at once the cause of their noisy demonstrations, and we added our voices to theirs in three rousing cheers for the Doctor as he stepped from the boat with a scratching, struggling cub in each hand. They had killed a bear, and captured her two cubs. Enough sport for one day at least.

THE STRENGTH OF TROUT.

SALMON fishing became very dull on the Moisie River by the middle of last July. As we were fixed there until the 21st, we turned our attention to the sea trout. Not till the 18th did we strike them in numbers, but after that they were sufficiently abundant to satisfy the most grasping.

It may not be amiss to state, in view of what follows, that I am of those who believe the sea trout and our brook trout (*Salvelinus fontinalis*) to be one and the same fish.

Upon the occasion hereafter referred to the trout averaged rather even in point of size, by far the greater number ranging within half a pound one way or the other of two pounds. Our largest was three pounds and five ounces, while very few ran so small as one pound. All were taken with the fly, the "Parmachence Belle" being the apparent favorite. A moderate current of between three and four miles an hour aided the efforts of the struggling fish to escape. All were fine active fish.

On the 19th the fish were so abundant that it was quite a matter of indifference whether they escaped after taking the fly or not. The idea then suddenly occurred to me that no better opportunity could present itself to determine by actual experiment how much a trout really could pull. Many, myself among the number, had theorized about this, but no one, so far as I then knew or now know, had ever subjected his theory to the touchstone of actual experiment.

I was provided with a tested spring-balance graduated to read to two ounces, and by which a pretty accurate determination to one ounce was possible. My first attempts were made as follows: After fastening a fish, the line was attached to the hook of the spring-balance between the reel and the first ring. But it was soon perceived that any result so obtained was modified by the friction of the line through the rings and tip-end of the rod, and that by this method the object in view—to ascertain the amount of strain which a trout of a given size could impose on a leader—could be but imperfectly attained.

The following method was then adopted and persisted in. After fastening a fish the rod was at once passed to the bowman of the boat, while my gaffer and I seized the line beyond the tip, one holding the fish so that there would be enough slack line near the tip to enable the other to fasten some part of this slack to the spring-balance. After the connection was made the line was released so as to bring all subsequent strain directly upon the spring-balance.

The results were most provoking. Trout are proverbially perverse, but it seemed to me as if I had never in my experience seen any so thoroughly imbued with this abominable characteristic. To make connection with the spring-balance required time, and by the time it was made the fish would either stop pulling altogether, or

would pull with but a portion of the vigor it had displayed while the line was being made fast. Then we would try to stir them up by jerking on the line. This generally produced the desired effect, but by no means in the desired degree before the line had been hauled in to such an extent as to make a fresh connection with the spring-balance necessary. This again took time, and by the time we were ready the fish would again become comparatively quiescent. Then we disconnected again, hauled the fish in hand over hand, fastened on the spring-balance once more, and then proceeded to stimulate the fish by poking it with the handle of the landing-net. When fortune seemed to smile on us it was in a but half-hearted fashion. Just as we thought we had a result, the fish would break away so that we could not complete the experiment by determining its weight. With all the larger fish either this was the case, or we could not induce them to do their best when we were in a position to record it.

For two days every fish I fastened, to the number of a hundred and more, was subjected to this experiment. The indicator of the spring-balance was never at rest for an instant when the fish were pulling against it, thus showing an incessantly varying strain. They seemed to pull their best during some portion of the time when the line was held while being attached to the spring-balance for the first time. Rarely indeed could one be induced even by the most savage treatment to pull as hard again. The greatest effect was produced when the fish darted off sidewise.

Of the many trials intimated above, in but four instance were the results satisfactorily conclusive. The following gives the strains in these four cases during the most violent paroxysm of the fish, and as far as I was able to judge measures quite accurately all that the individual fish described could do:

A trout of	1 pound	9 ounces	pulled	1 pound	4 ounces.
" "	1 pound	1 ounce	"		12 ounces.
" "	1 pound	11 ounces	"	1 pound	5 ounces.
" "	1 pound	9 ounces	"	1 pound	8 ounces.

But though these four cases were all that were sufficiently conclusive to merit detailed report, many of the others were more or less suggestive. From the whole series of experiments I concluded that I had underestimated the power of trout. I now think that an active and enterprising trout can impose, and that during some part of its struggle for life it may for an instant impose on the leader which holds it a strain equal to the trout's own weight. But this I am inclined to think is the extreme limit of its power.

It was my intention to refrain from printing these experiments until with self-registering indicators and other specially devised appliances I could continue the investigation with salmon as well as with trout, and in such a manner that every fish fastened which did not break away would yield a definite result, instead of, as was the case, but one out of every thirty or forty. But I am persuaded to do otherwise. HENRY P. WELLS.

NEW YORK, Oct. 28.

FLORIDA.—A gentleman writes us that he would like to join a party in camping in Florida where the fishing is good and the cost of living not too great. He would like to spend about three months there. We will take pleasure in placing such a party in correspondence with him.

LAKE ERIE BASS.—Cleveland, O., Oct. 29.—For some unexplained reason the inshore fishing in the lake in this region is very poor. It is so poor that very few go out after bass at all. Usually the fishing is good at this time of the year, but this is an exception.—HOMERUS.

Fishculture.

Address all communications to the Forest and Stream Pub. Co

LIST OF FISH COMMISSIONERS.

FOREST AND STREAM presents its annual list of the Commissioners of Fisheries and Fishery Officers of the different Provinces, States and Territories of North America, revised and corrected to Oct. 30. Those marked with a * have not been heard from, and the names there given are those of last year:

THE UNITED STATES—
Prof. G. Brown Goode, Washington, D. C.
Maj. T. B. Ferguson, Assistant Commissioner, Washington, D. C.
Col. M. McDonald, Chief of Division of Distribution, Washington, D. C.

ALABAMA—
Col. D. R. Hundley, Madison.
Hon. Charles S. G. Doster, Prattville.

ARIZONA—
J. J. Gosper, P. O. address, Los Angeles, Cal.
Richard Rule, Yuma.
J. H. Taggart, Business Manager, Yuma.

ARKANSAS—
H. H. Rottaken, President, Little Rock.
J. W. Calloway, Little Rock.
W. B. Worthen, Little Rock.

CALIFORNIA—
Joseph Routier, President, Sacramento.
Thos. J. Sherwood, Secretary, Marysville.
J. Downie Harvey, Los Angeles.

DOMINION OF CANADA—
John Tilton, Deputy Minister of Fisheries, Ottawa, Ont.

PROVINCE OF NEW BRUNSWICK—
W. H. Venning, Inspector of Fisheries, St. John.

PROVINCE OF NOVA SCOTIA—
W. H. Rogers, Inspector, Amherst.
A. C. Bertram, Assistant Inspector, North Sydney.

PROVINCE OF PRINCE EDWARD ISLAND—
J. H. Duvar, Inspector, Alberton.

PROVINCE OF QUEBEC—
W. Wakeham, Inspector Lower St. Lawrence and Gulf Division, Gaspé Basin.

PROVINCE OF BRITISH COLUMBIA—
Thos. Mowat, Inspector, New Westminster.

PROVINCE OF MANITOBA AND NORTH WEST TERRITORIES—
Alex. McQueen, Inspector, Winnipeg, Man.
(S. Wilmot, Supt. of Fishculture, New Castle, Ont.).

*COLORADO—
John Pierce, Denver.

CONNECTICUT—
Wm. M. Hudson, Hartford.
Robert G. Pike, Middletown.
Jas. A. Bill, Lyme.

DELAWARE—
Elwood R. Norny, Odessa.
Dr. E. G. Shortlidge, Assistant and Superintendent of Hatcheries, Wilmington.

GEORGIA—
Hon. J. T. Henderson, Commissioner of Agriculture, Atlanta.
Dr. H. H. Cary, Supt. of Fisheries, LaGrange.
(Under the laws of the State these constitute the Board of Fish Commissioners.)

ILLINOIS—
N. K. Fairbank, President, Chicago.
S. P. Bartlett, Secretary, Quincy.
Maj. G. Breuning, Centralia.

INDIANA—
Enos B. Reed, Indianapolis (Term expires in 1887).

IOWA—
E. D. Carlton, Spirit Lake.

KANSAS—
S. Fee, Wamego, Pottawatomie county.

*KENTUCKY—
Wm. Griffith, President, Louisville.
P. H. Darby, Princeton.
John B. Walker, Madisonville.
Hon. C. J. Walton, Munfordville.
Hon. John A. Steele, Midway.
W. C. Price, Danville.
Hon. J. M. Chambers, Independence.
A. H. Goble, Catlettsburg.
J. H. Mallory, Bowling Green.

MAINE—
E. M. Stilwell, Bangor.
Henry O. Stanley, Dixfield.
B. W. Counce, Thomaston, Sea and Shore Fisheries.

MARYLAND—
Dr. E. W. Humphreys, Salisbury.
G. W. Delawder, Oakland.

MASSACHUSETTS—
E. A. Brackett, Winchester.
F. W. Putnam, Cambridge.
E. H. Lathrop, Springfield.

MICHIGAN—
John H. Bissell, Detroit, President.
Herschel Whitaker, Detroit.
Dr. J. C. Parker, Grand Rapids.
(Secretary, A. J. Kellogg, Detroit.)
(Superintendent, Walter D. Marks, Paris.)

MINNESOTA—
3d District—Dr. Rob't Ormsby Sweeny, President, St. Paul.
2d District—Niles Carpenter, Rushford.
1st District—William Bird, Fairmount.
(Superintendent, S. S. Watkins, Willow Brook, St. Paul.)

MISSOURI—
H. M. Garlichs, Chairman, St. Joseph.
J. L. Smith, Jefferson City.
H. C. West, St. Louis.
A. P. Campbell, Secretary, St. Joseph.
(Superintendents: Phillip Kopplin, Jr., St. Louis; Elias Cottrill, St. Joseph.)

NEBRASKA—
William L. May, Fremont.
Dr. Robert R. Livingston, Plattsmouth.
B. E. B. Kennedy, Omaha.
(Superintendent, M. E. O'Brien, South Bend.)

NEVADA—
W. M. Cary, Carson City.

NEW HAMPHIRE—
Geo. W. Riddle, Manchester.
Elliot B. Hodge, Plymouth.
John H. Kimball, Marlborough.
(Superintendent, E. B. Hodge, Plymouth.)

*NEW JERSEY—
Richard S. Jenkins, Camden.
William Wright, Newark.
F. M. Ward, Newton.

NEW YORK—
Hon. R. B. Roosevelt, President, New York.
Gen. R. U. Sherman, New Hartford.
E. G. Blackford, Fulton Market, New York.
Wm. H. Bowman, Rochester.
A. S. Joline, Tottenville.
E. G. Blackford, Shellfish Commissioner.
(Superintendents: Seth Green, Rochester; Fred Mather, Cold Spring Harbor; Monroe A. Green, Mumford; James A. Marks, Bloomingdale. Secretary: H. H. Thompson, Brooklyn; Clerk of Shellfish Commission, E. P. Doyle, Tompkinsville.)

OHIO—
Hon. C. V. Osborn, President, Dayton. (Term expires 1891.)
John Hofer, Bellaire. (Term expires 1890.)
H. P. Ingalls, Huntsville. (Term expires 1889.)
A. C. Williams, Secretary, Chagrin Falls. (Term expires 1888.)
E. D. Potter, Toledo. (Term expires ——.)

PENNSYLVANIA—
Henry C. Ford, President, 524 Walnut street, Philadelphia.
James V. Long, 205 Ridge avenue, Allegheny City.
H. C. Demuth, Secretary, Lancaster.
S. B. Stilwell, Scranton.
A. S. Dickson, Meadville.
W. L. Powell, Harrisburg.

RHODE ISLAND—
John H. Barden, Rockland.
Wm. P. Morton, Providence.
Henry T. Root, Providence.
(These Commissioners are appointed for three years by the Governor, and receive no compensation except actual expenses). The following are the Shellfish Commissioners, who are elected by the Legislature and receive pay for their services:
James C. Collins, North Providence.
N. P. S. Thomas, North Kingstown.
James M. Wright, Foster.

SOUTH CAROLINA—
Hon. A. P. Butler, Columbia.

*TENNESSEE—
W. W. McDowell, Memphis.
H. H. Sneed, Chattanooga.
Edward D. Hicks, Nashville.

VERMONT—
Hon. Herbert Brainerd, St. Albans.
F. H. Atherton, Waterbury.

VIRGINIA—
Col. Marshall McDonald, Berryville.

*WASHINGTON TERRITORY—
Albert T. Stream, North Cove, Pacific county.

WEST VIRGINIA—
C. S. White, President, Romney.
F. J. Baxter, Treasurer, Sutton.
James H. Miller, Secretary, Hinton.

WISCONSIN—
The Governor, *ex-officio*.
Philo Dunning, President, Madison.
C. L. Valentine, Secretary and Treasurer, Janesville.
Mark Douglas, Melrose.
A. V. H. Carpenter, Milwaukee.
Calvert Spensley, Mineral Point.
E. S. Miner, Sturgeon Bay.
(James Nevin, Superintendent, Madison.)

WYOMING TERRITORY—
Otto Gramm, Laramie (Commissioner for the Territory).
For Carbon county, B. F. Northington, Rawlins.
For Laramie county, Dr. W. N. Hunt, Cheyenne.

NOTES ON THE COMMISSIONS.

ARIZONA TERRITORY.—There is no appropriation for this commission, and therefore the office of Commissioner is merely honorary.

ARKANSAS.—Of this State we can only repeat the above. The people have not awakened to the importance of fish-culture, and their representatives are still asleep; the Commissioners pay their own postage, provide their own stationery, and when they make a report to the Legislature it is never printed. The waters of the State contain some good fish, but are filled with nets, dams, traps, and the dynamiter is abroad with none to molest him or make him afraid. Truly a missionary is needed in Arkansas.

CALIFORNIA.—The work in this State is being pushed with more than usual vigor, and the reports are very satisfactory.

NEVADA.—Considering the small appropriation much good work has been done in this State. A hatchery is sadly needed in order to stock the waters. At present the one Commissioner is frequently changed, and if he attempts the hatching of fishes in the vicinity of his residence the work is merely of a temporary character.

NEW YORK.—The hatchery at Caledonia has long been the principal source of supply of trout and whitefish, but the Long Island station is evidently going to be the leading one as it has salt-water facilities as well as a flow of fresh water. The South Side *Signal* says: "The contract for building the new hatchery for the New York Fish Commission, at Cold Spring Harbor, has been awarded to J. B. Lefferts, of Huntington. Work has been begun and the building is to be finished by Jan. 1. It will be the finest hatchery in the State, and its capacity will be greatly increased. Superintendent Mather has designed some improvements in both the fresh and salt-water departments, which will materially simplify the work of hatching and bring it all together on one floor instead of on two as in the old house." The new hatchery in the Adirondacks is in process of erection and, with the hatchery of Mr. Hill at Clayton, will make six fish nurseries belonging to or operated by the State.

NORTH CAROLINA.—The Fish Commission has been abolished in this State. Mr. S. G. Worth, the former Superintendent, worked hard to make it popular but the law-makers looked at the dollars and not at the dinner tables of their constituents.

RHODE ISLAND.—In this State the old Board of Fish Commissioners get only their actual expenses, while the Commissioners of Shell Fisheries get a salary. As this is mainly a salt-water State it is possible that this state of things approximates the external fitness.

UTAH.—In our last year's list we gave the name of Hon. John T. Caine as the Fish Commissioner of this Territory. We were wrong. Mr. Caine tells us that there is no Board of Commissioners, but as a delegate in Congress he has done what he could to further the fishery interests of the country by the introduction of carp and other fishes, and that he takes great interest in fishculture, and hopes to interest the law-makers in it.

PROTECTION OF SHAD.—Trenton, N. J., Oct. 26.—The New Jersey fish wardens, whose duty it is to patrol the Delaware River and protect the shad from piratical fishermen during the close of the season, have finished their reports, which will be presented to the New Jersey State Fish Commissioners during the coming week. Although the shad have been of large size and good flavor, there is a marked decrease in the catch year after year. If there is not further protection thrown around them it is feared they are doomed to be driven out of the Delaware River, although the Government is placing hundreds of thousands of spawn in the river each year. The nets are thought to be too small in the meshes, and thousands of small shad are caught and sold in bulk to fish dealers, together with great quantities of herring.

SALMON IN THE HUDSON.—On Tuesday last a spent male salmon was taken at Port Monmouth, N. J., and sent to Fulton Market. The fish was quite poor, being 2½ft. long and weighing but 7lbs. Mr. Blackford bought it for exhibition only. The hook on the jaw was but slightly developed and the sides were bright with red blotches, which distinguish the male salmon in the breeding season. It is thought that the fish had been up the river and was on its way to the sea to recuperate.

The Kennel.

FIXTURES.

DOG SHOWS.

Dec. 6 to 8.—Third Annual Dog Show of the Central Berkshire Poultry, Pigeon and Pet Stock Association. W. T. Webster, Secretary, Lee, Mass.

Dec. 6 to 10.—Second Annual Dog Show of the Northern Illinois Poultry and Pet Stock Association, at Rockford, Ill. W. J. Hamley, Superintendent.

Dec. 14 to 16.—Third Annual Dog Show of the Winsted Kennel Club. Frank D. Hallett, Superintendent, Winsted, Conn. Entries close Dec. 3.

Jan. 23 to 27, 1888.—First Dog Show of the Agusta Pet Stock and Poultry Association, at Agusta, Ga.

Feb. 21 to 24, 1888.—Twelfth Annual Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent.

April 3 to 6.—Fourth Annual Dog Show of the New England Kennel Club, at Boston, Mass. J. W. Newman, Secretary.

FIELD TRIALS.

Nov. 7.—First Annual Field Trials of the Indiana Kennel Club at Bicknel, Ind. Open to dogs owned in Indiana. P. T. Madison, Secretary, Lock Box 4, Indianapolis, Ind. Entries close Oct. 25.

Nov. 7.—Third Annual Field Trials of the Western Field Trials Association. R. C. Van Hora, Secretary, Kansas City, Mo.

Nov. 21.—Ninth Annual Field Trials of the Eastern Field Trials Club, at High Point N. C. W. A. Coster, Secretary, Flatbush, Kings County, N. Y.

Dec. 12.—First Annual Field Trials of the American Field Trials Club, at Florence, Ala. C. W. Paris, Secretary, Cincinnati, O.

Jan. 10, 1888.—Second Annual Field Trials of the Texas Field Trials Club, at Marshall, Tex. W. L. Thomas, Secretary, Marshall, Tex.

Jan. 16.—Fifth Annual Field Trials of the Pacific Coast Field Trial Club, near Kingsburgh, Cal. N. P. Shelden, Secretary, 320 Sansome street, San Francisco, Cal.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **5492.**

AMERICAN FIELD TRIAL CLUB.—Cincinnati, O., Oct. 28.—*Editor Forest and Stream:* Some days ago you were furnished with a list of judges for the All-Age Stake and two of the judges for the Derby for our trials this fall. I beg to advise you now that J. H. Whitman, of Chicago, Ill., has been appointed as the third judge for the Derby. You now have the complete list of our judges.—C. W. PARIS, Secretary.

THE AMERICAN COURSING CLUB MEET.

THE annual meeting of the American Coursing Club was held at the permanent headquarters of the association at Great Bend, Kan., beginning Oct. 17. General notice had been given to the member of the club that the entries were to be closed on Saturday, Oct. 15, but to accommodate some parties who lived at a distance, and to increase the entries by the addition of some dogs said to be on the road, the questionable policy was adopted of holding open the entries until Monday, the day on which the running was advertised to begin. This delayed the running an entire day.

On Tuesday morning the members of the club went out to the grounds upon the great expanse of level country known as the Cheyenne Flats, about seven miles north of Great Bend. This plain is almost as level as a floor, and is the finest coursing ground in the world, in the judgment of all coursing men present. The club house had been moved out from the bluff into the middle of the flats, an arrangement which was found to be a great improvement, as the courses were often visible during their entire length from the deck and balconies of the building. The wire fences, under the supervision of Mr. W. W. Carney, whose ranch lines include the club grounds, had been carefully gapped and flagged at the proper places, and the bottom wires lifted so that the dogs should not injure themselves. Red danger flags were also duly put up at the bad grounds, dog towns, etc., so that horsemen might be warned. A crowd of spectators rapidly gathered. By afternoon there were probably 800 to 1,000 people on the grounds. The weather was fine. Mr. H. C. Lowe, of Topeka, and Mr. T. W. Bartels, of Denver, alternated as judges.

The first brace were put down at 11:10 A. M., Robert Smart's black dog Flink (who matched the runner-up in last year's All-Age Stake) and R. D. Saulsbury's white and fawn dog Leo going to the slips. A red hot whitetail jack was started, which led a two miles' chase. Flink got off with his phenomenal starting burst of speed, was first to the hare, and secured a go-by and a turn. On the turn Leo drew in, but Flink took a second go-by and a wrench. Leo then took a go-by, but at once lost it to Flink, who turned. The hare led out for the hills and escaped. No further points were made. Leo showed no speed, and quit. Flink won.

J. V. Brinkman's brindle and white bitch Constance and D. N. Heizer's white dog Demon went down next. A sulky jack was started, which declined to run at first. The bitch scored the better at the start, and rolled up several wrenches and a turn. The white dog took the turn and led the running, the hare making for a road, down which she ran for a half mile. There was some exchanging, but Demon showed better speed and worked the hare closely. The bitch gave up slowly but ran game. Demon pressed the hare out on the grass, scored a trip and a turn, killed and won.

C. F. Culver's brindle dog Full of Fun and L. Zutavern's black bitch Thorna were slipped on a two hundred yards start on the buffalo grass. Thorna again turned, and so placed Full of Fun, who took up the running and turned. Thorna drew in, wrenched and turned. On the straightaway Full of Fun made a racing go-by, but lost to Thorna, who held possession and crowded the hare a corkscrew course down the road, turning and killing under the fence, the brindle not six feet distant. Thorna won.

After dinner I. D. Brougher's brindle bitch Do or Die was started with M. E. Allison's red fawn dog Terry, the runner-up last year in the All-Age. Terry was first off. Do or Die quit at a half mile. Terry ran a mile and a half, not turning the hare. Terry won.

W. W. Carney's red fawn dog Barney and Col. David Taylor's black dog Midnight, winner of the puppy stakes last year, next went into slips, and were soon started on one of the fastest and hardest courses of the meet. Midnight has improved much in appearance since last year. Midnight got to the hare first, turned and wrenched, scoring for three-quarters of a mile. The big red dog then drew in, took a go-by, and scored six points and went fair to win. Midnight again got possession, and handled the hare beautifully to the finish, killing and winning. The points scored over thirty.

R. D. Saulsbury's brindle bitch, Lady in Black, beat B. M. Mutersbaugh's black bitch Dina Black in a long course over grass. Little scoring was done. Lady in Black showed a wonderful burst of speed, and was first in at the hare. No kill. Lady in Black won. She is a half sister to C. G. Page's Schoolboy and out of English champion stock.

Dr. G. I. Royce's mouse bitch Honey Bee was slipped with Dr. Q. Van Hummel's brindle and white dog Rich and Rare. A hare was killed within 100yds., and no course was had. On the second hare Rich and Rare showed a trifle better speed to the hare. Honey Bee stayed well and turned far more handily than the brindle. On a straightaway Rich and Rare scored a go-by, and this with his start gave him the course, as the decision was rendered. Honey Bee should have won by two points, earned by superior handling of the hare.

Peter Daugherty's brindle dog Clumsy Jack and C. Cookson's brindle dog Newton Tip were drawn together. Newton Tip was nominated by Mr. H. C. Lowe, one of the judges, but Mr. Cookson is his owner. Newton Tip did all the work, killing within half a mile. In 200yds. more he would have lost, for he was not working his best, but waiting.

M. E. Allison's red fawn dog San Pedro went down with C. G. Page's mouse and white dog Pedro. A lively young jack was started. Pedro made more points on the lead-up, scoring two go-bys and several wrenches. San Pedro waited, and so lost subsequent points. It was give and take at the finish, the hare doubling and turning for five minutes on a space not larger than one acre. If count could have been kept accurately the points would probably have scored forty or fifty. Pedro won.

M. E. Allison's red fawn dog Sandy Jim (the champion of last year), and Dr. G. I. Royce's mouse bitch Humming Bird next went into the slips. Jim outspeeded all the time, though in the exchanging the little bitch showed herself a good one. Jim took a go-by; the course then led across a ditch, Jim was first over, turned and killed. Genuine sympathy was expressed for Dr. Royce, that both his bitches, on which he had prided himself so much, were so drawn that each was shut out on her first course. There were many much poorer dogs who went well down into the runnings. This closed the coursing for Tuesday.

On Wednesday morning the weather was bright, and the spectators equal in numbers to those of the day before. C. G. Page's brindle bitch Belle P. and A. C. Schermerhorn's black and tan dog January were the first brace down. Belle P. got first to the hare with a wonderful burst of speed, and turned twice, placing January, and then taking a go-by, did all the work again. In the road, both dogs exchanged and staid well. Belle P. killed and won.

Ed. Tyler's black dog Bounce and A. C. Fair's black dog Fleet Aleen went down together. Three hares were started before the dogs were slipped on a fair course. Both dogs got unsighted; when sighted Bounce had 30yds. advantage, but the hare turned and Fleet Aleen drew in, got a go-by, scored two turns, wrenched five times, and turned. Bounce was placed, but could not stay. Fleet Aleen killed and won.

R. D. Saulsbury's black and white bitch Meta went to slips with D. C. Luse's red fawn dog Sport Aleen. Two short no-courses were run; then a third jack, a grand one, was started on the buffalo grass and ran toward the club house. Meta scored six points before Sport Aleen got in. Sport Aleen got possession, but the bitch drew by. The work was so close that no go-by was possible. Sport Aleen scored four points in the exchanging. Meta drew by, scored three wrenches and a turn, then led and killed. Sport Aleen was found to have torn off a toe-nail, and so injured his foot that he could not have run the next dog.

After dinner D. C. Luse's fawn bitch Lavina beat G. N. and E. R. Moses' mouse bitch Flirt in a short course to earth along a deep ditch.

A. S. Allen's light fawn dog Jim Blaine (owned by John Jones) was slipped with D. C. Luse's red fawn bitch Paulina, on a long course over grass and soft ground. Paulina showed better speed and earned more in the exchanging, Jim Blaine killed to her turn. Paulina won.

Frank K. Doan's St. Louis dog Fat and Arthur Massey's brindle bitch Gipsy went down, and after a short no-course were started on a two-mile course, in which the hare escaped. Gipsy led, but took two wrenches and a turn; Fat took a go-by and turned. Gipsy got possession, turned and wrenched, and led on a straight-away, giving Fat no place and winning.

Running was now begun in the Great Bend Derby, or Puppy Stakes. The first brace were Amos Johnson's black bitch Dinah Black and D. N. Steizer's black bitch California Bell. Dinah Black clearly led in speed and turning. The hare escaped. California Bell fell out of the course. Dinah Black won.

B. M. Mutersbaugh's brindle and white bitch Lady Estelle and W. J. Dixon's black bitch Plus went down. Lady Estelle was first to the hare. Plus got possession, and after a few exchanges drew away, showing better speed on a long course, in which the hare was lost. Plus won.

On Thursday morning the weather was fair and bright; probably a thousand people were on the grounds. The Puppy Stakes were continued. S. J. Shaw's fawn bitch Lavina and Mrs. L. F. Tyler's black dog Tippecanoe were led out on the flats east of the club house. A strong jack was at length started, and coursed for over a mile. Tippecanoe led from the slips, and stayed for ¼ mile, placing Lavina, who then wrenched twice. The black dog got a go-by, and in the exchanging was a trifle better, and at the close wrenched and turned ahead of the bitch, and won. Mr. Bartels judged this course. Mr. Lowe, though not judging, desired to follow the course. The horse of the FOREST AND STREAM reporter bolted the course and struck Mr. Lowe's horse, turned his saddle, and unhorsed him, giving him an ugly fall. Fortunately Mr. Lowe was not hurt, and he judged the next course looking as fresh and handsome as ever.

A. Laidlaw's mouse bitch Truefoot was slipped with H. P. Typer's black dog Colonel on a two-miles course down a road. The exchanging was hard and close, but at the finish Colonel scored a go-by, a turn and the kill. Colonel won.

T. W. Bartel's black dog Catchem and E. A. Rowell's black dog Dick Taylor went into the slips together. The dogs were not sighted well, and Catchem perhaps had the advantage in this, but he placed Dick Taylor, then took possession, turned, wrenched twice and killed. A quarter mile course. Catchem won.

Dr. G. I. Royce's black bitch Widow in Weeds and A. J. Buckland's white and fawn bitch Ruby were slipped on a three-mile course. The black bitch outscored the younger puppy, being older and harder. The hare was fairly run to a stand-still. Widow in Weeds stopped also and looked at her as she sat. The hare went on slowly, Widow followed. Ruby "came to" and killed. Widow in Weeds won. The course was so hard that on the following day Widow in Weeds was found disabled and unfit to run, and was withdrawn. She was expected to make trouble in the puppy stakes.

After dinner Geo. Spencer's mouse dog Dandy and D. C. Luse's brindle dog Full of Fun ran a mile course. Full of Fun scored best till he lost place on a stumble. Dandy drew in but could not score. Full of Fun won.

W. W. Egnew's white bitch Lady Dublin and C. P. Townsley's mouse dog Bob killed in a no-course of 40yds. A second course was run over fallow ground into the hills. The judge missing the gap in the wire fence, was unsighted, and could not decide the course. The dogs were ordered up.

E. W. Moses's brindle bitch Lady Gray was slipped with B. M. Mutersbaugh's fawn bitch Baby May. Lady Gray was the better off and scored, but Baby May took a go-by and worked the hare nicely, showing superior speed, and won by one point. The hare was lost.

M. E. Allison's fawn dog Rowdy and O. B. Wilson's fawn dog Minus next went into the slips. Minus scored the run up and a turn; Rowdy a go-by, a turn and several wrenches. Rowdy led over a mile of grass and dog town and won.

D. C. Luse's red fawn bitch Clara then beat F. Zutavern's white and red fawn bitch Jessamine nearly pointless, though Jessamine killed.

Lady Dublin and Bob were ordered down again. The first hare was not sighted; a second took to the hills out of sight. The dogs were ordered up, as the owners protested they were unfitted by the work on the undecided courses. It is true they were tired, but each was as tired as the other, and it was a grave mistake to take them up, as this was just at the end of the puppy stakes. It threw out the runnings in the second series of the All-Aged Stakes on the following day, and caused the same dogs to run in that series oftener in the same day than they otherwise would. The members of the club are yet a trifle disposed to object to rules and decisions when they traverse individual wishes. This is not business, and it is not coursing. A good example was, however, set by Mr. Lowe in the bye race of J. W. Brown's dog Hal J., which should have been the next event. Somebody had said that the Lady Dublin—Bob course would be the last of the day, and so Hal J. was taken back to kennel and was not on hand. The judge very properly disqualified him, and cannot be too highly commended for so doing. Mr. Lowe did much during this meeting to bring order out of the former chaos by his insistence upon the rules of coursing. This is all in the right direction.

Running was now perforce begun in the second series of the All-Age Stakes. Mr. Smart's Flink and Mr. Heizer's Demon were ordered to the slips. Demon apparently ran sly for a time. Flink knows nothing but to get to his hare, and has never been known to run cunning. Demon undoubtedly took a racing go-by, but Flink surpassed in turning and won right, even if Demon were not disqualified for running sly.

Mr. Allison's Terry and Mr. Zutavern's Thorna came next in this series. Terry led from the slips and scored two turns and a wrench. Thorna was placed, but Terry got a go-by and wrenched twice. Running through the line of beaters Terry struck a wagon wheel and was perhaps numbed a little. The hare led for the hills and Thorna took a go-by, but could not get in. On the hill Terry showed ahead. Terry won.

Mr. Page's Belle P. and Col. Taylor's Midnight ran a course down the slope and out over the flats. Belle P. placed Midnight and then took the hare and never allowed the black dog another point. Belle P. made two go-bys, three trips and numerous wrenches, Midnight not even helping. Midnight killed to her trip, but was beaten pointless. Great surprise was expressed at the poor race he ran. Both dogs were in the front rank last year.

Mr. Cookson's Newton Tip and Mr. Salisbury's Lady in Black went in. Newton Tip led up and did all the work. Lady in Black was placed, but was beaten pointless, Tip holding possession for over a mile and a half, turning and wrenching in good style.

Mr. Page's dog Pedro being found crippled and unfit was withdrawn. A bye race was ordered for Dr. Van Hummel's Rich and Rare and Dr. Royce's Honey Bee. Honey Bee was unsighted for a moment at the start. Rich and Rare led, but could not turn the hare. This was no test against Honey Bee. The bitch had just been heavily fed. She was brought from the kennel without Dr. Royce's knowledge, and his consent was courteously given to prevent delay in bringing up another dog. The runnings were closed for the day.

On Thursday morning the weather was warm and clear. Probably 1,200 to 1,500 people were in the line by early afternoon. The postponed course between Lady Dublin and Bob, in the Puppy Stakes, was ordered run. These unfortunate puppies, after three-quarters of an hour of beating, were not sighted on their first hare. The second hare they killed within 100yds., and no course was had. It looked as if the brace would never get a course. At last a rattling jack led out for the flats. Bob got off a trifle the better, and placed Lady Dublin on the turn. Lady Dublin got possession, turned twice, got a go-by and led. Both dogs quit at a mile and a half. Bob behind badly. Lady Dublin won.

Running was resumed in the second series of the All-Aged Stakes. Sandy Jim and Fleet Aleen went to the slips. Great interest was evinced in this race between the former champion and the big black. As they appeared in the slips Sandy Jim seemed—what he really is—much the better greyhound; his condition was perfect. Fleet Aleen was said to have stolen a hearty breakfast that morning. A young jack was started, and the dogs were ordered held. Fleet Aleen broke from the slips and coursed. To keep him from wearing himself out unfairly Sandy Jim was ordered slipped also. Sandy Jim ran to the hare and killed to the black dog's turn. No course.

Mr. Saulsbury's Meta and Mr. Luse's Lavina made the next brace. Meta placed Lavina and then regained possession, taking three go-bys, out-speeding and working fairly well. The jack, a red hot one, ran two miles and a half and then escaped. Meta won.

Sandy Jim and Fleet Aleen were put in the slips again, each being led single. It was claimed that Fleet Aleen fought in the slips. If so, he should not have been qualified. By mismanagement of this doublebarreled slipping scheme, a fine jack got off unsighted. After some time a second good one was started. Fleet Aleen took the lead-up distinctly. Jim, beyond question, ran shy. He had his cars up. Jim took place, and made a clear racing go-by. He seemed then to realize he had something to do. At a low wire fence Jim slowed up a trifle and Fleet Aleen took a go-by. Both dogs had an equal chance at the fence, but Fleet Aleen's go-by was no actual proof of superior speed, though it scored. Fleet Aleen kept possession for a hundred yards or so further, turned and killed. Fleet Aleen won, scoring seven points; Sandy Jim second, three points. The Great Bend people made much of the vanquisher of the champion. The course was about a mile in length.

Mr. Luse's Pauline went into the slips with Mr. Massey's Gipsy. The latter bitch was lame from earlier work. Gipsy ran up first; Pauline took a go-by, turned, wrenched and led in speed, having the best in the exchanging. The course ran over two miles, and was one of the best yet seen, Gipsy keeping Pauline fairly busy for a lame one. Pauline turned, killed, and won.

Running was taken up in the second series of the Derby or puppy stakes. Mr. Johnson's Dinah Black and Mr. Dixon's Plus made the first brace. Plus led up to the hare and placed Dinah Black, then turned and wrenched several times. Dinah Black drew in and wrenched repeatedly, but lost place to Plus, who tripped, turned, tripped and turned again to Dinah Black, who killed neatly in water. Plus won. The bitches were placed wrong in the slips, and resembling each other as they did, confusion for a time existed concerning the decision, it being held that Dinah Black won. The course was about half a mile in length.

Mr. Typer's Colonel and Mrs. Tyler's Tippecanoe, another brace of blacks, next went off after a grand white-tail jack. The doublings at first threw both dogs out, but when the course straightened Tippecanoe showed ahead; a questionable wrench was all he scored, but he clearly led and gained on Colonel for over two miles. A third hound broke loose from the crowd and coursed also, but Tippecanoe distanced this additional competition, ran his hare three miles and a half and won.

Dr. Royce's Widow in Weeds being unfit was withdrawn. Mr. Bartel's Catch'em was ordered a bye. Dick Taylor was brought out as his mate. The course was long and led to the bluffs. Being a bye race it was not followed by the reporters. Catch'em's color went up for winner.

Mr. Luse's Full of Fun and Mr. Egnew's Lady Dublin were next slipped. Full of Fun beyond question waited and let Lady Dublin push the hare for over half a mile. Lady Dublin wrenched repeatedly. Full of Fun drew in on the turn, then got a go-by and a turn, and showed better speed across two miles of grass. The hare was lost. Full of Fun was awarded the course. By strict coursing rules he should have been barred after his cunning start.

Mr. Mutersbaugh's Baby May and Mr. Allison's Rowdy were soon slipped on a grand course. Rowdy ran up and wrenched. Baby drew in. Rowdy led, scoring. Baby got a go-by. Rowdy led, scoring all the time for a half mile. Rapid exchanging followed, in which Rowdy had the best of it. The hare then turned and came back over her first course, on the soft ground along the fence. After two miles of running hare and dogs were nearly run to a standstill. The hare squatted in the weeds; Rowdy stopped and looked at her. Baby stopped a little further back. The hare went wearily on; Rowdy followed slowly and in the weeds killed out of sight. The hare probably fell dead. Baby May quit. Rowdy won. He is a game one.

Mr. Luse, who owns him, seemed of the opinion that Hal T.'s disqualification had been removed. Hal T. was put in the slips with Clara. Clara beat him pointless, so the result was not changed; but the course should have been announced as a bye.

The running had now gotten so far as the third series of the All-Aged Stakes. Great excitement existed when Mr. Smart's Flink and Mr. Allison's Terry were led out. Flink is held invincible by his backers. Terry looked as cheerful and happy as ever, his long lower jaw showing his teeth in the style peculiar to him. Both dogs received cheers, and both were heavily backed. A large hare was started and both dogs were well sighted and slipped. Terry led to the right; the hare turned of herself and went to the left. Flink bore directly to the left with a great burst of go and ran a direct line to the hare as if it had been arranged. Flink wrenched and so placed Terry, who got in. Terry wrenched. Flink took a distinct racing go-by and wrenched, placing Terry again. Terry wrenched. Flink took a second distinct and unmistakable racing go-by and then held possession, at once scoring a turn, a wrench and a trip, throwing the hare to Terry, who killed. Flink showed great brilliance, dash and sense. The course was about a half mile. Mr. Allison thought it was too short for Terry. Flink won.

Another exciting course followed, as Mr. Cookson's Newton Tip and Mr. Page's Belle P. came out. One weak hare was allowed to go away; the dogs were then slipped on a good one. Belle P. led up, placed Tip on the wrench, took a go-by, placed him again, took a second go-by, and then led all the way, wrenching often, turning, wrenching again, and tripping. On the trip Belle P. threw the hare belly up ten feet, into Newton Tip's mouth. Belle P. won with ease and brilliance.

Fleet Aleen was now led out to run his second course for the day, going into the slips with Dr. Van Hummel's much vaunted Denver dog Rich and Rare. Fleet Aleen was for a moment unsighted at the start by a voluntary turn of the hare. Rich and Rare laid a better course, and drew away, keeping the lead. Rich and Rare coursed the hare two miles over grass, but never turned or scored after the lead up. Mr. Bartels, judging, riding behind at some distance, was of

the opinion that Rich and Rare wrenched. This was emphatically not the case, as the alternate judge, officers of the club and representatives of the press, who rode the inner circle of the course and could thus observe more plainly, all agreed that the changing of the hare's course was not from any crowding. The dog followed the hare in her course, and that was all there was to it. Rich and Rare won.

Mr. Saulsbury's Meta and Mr. Luse's Paulina were put in slips, but no hare was found and the runnings were ordered closed. It had been a most delightful, successful day.

The members of the club met at the club rooms at Great Bend on that (Friday) evening, to enjoy a banquet offered by the ladies of the resident members. The table was plentiful and elegant, and all the arrangements perfect. During the progress of a most enjoyable evening responses were made to appropriate toasts by Col. David Taylor, Mr. C. G. Page, Dr. G. I. Royce, Mr. H. C. Lowe, Mr. T. W. Bartels, Judge Townsley, Mr. Frank K. Doan, Mr. A. C. Fair, Mr. J. V. Brinkman, and representatives of the sporting press. Mr. W. W. Carney was thanked for his generous treatment of the club in throwing open his ranch. The citizens of Great Bend and members of the club engaged in mutual felicitations. The occasion was highly pleasurable. The ladies of Great Bend deserve high thanks from all present.

Saturday morning was clear and warm. There were over two thousand in line by noon. As a popular event the meeting has already become a pronounced success. The early comers found hanging up in the club room a large wolf (coyote) which had just been killed by Mr. Amos Johnson's big black and tan dog January. The wolf was sighted within two miles of the club house by Mr. Johnson, and when January was loosed he closed within a mile and killed the wolf by himself. This is sufficient commentary on the large dog question. For game larger than rabbits, the little ones are too light. They are handy on the hares, but not on the hare-killers.

Meta and Paulina went to the slips. The judge got on the wrong side of a wire fence, and was unsighted. No course.

Plus and Tippecanoe were ordered down in the third series of the Puppy Stakes. The Meta—Paulina course had to drag along. This should have been run the day before, which was prevented by the Lady Dublin—Bob carry-over on the day previous. The fruits of deviation from the card now began to grow apparent. This was vigorously and sensibly commented upon by Mr. Lowe. As a matter of fact, this one deviation threw the final runnings over to Monday, when they might as well have been finished on Saturday. The club needs to learn that rules are made to be followed, and that not each man is free to except himself from them. While the judge was explaining these points, Plus and Tippecanoe were slipped on a hare. Plus took a racing go-by, Tippecanoe drew by on the inner circle. No kill. No further scoring. Plus won.

Catchem and Full of Fun were next in the third series of the Puppy Stakes. The judge missed the gap in the wire, and as the dogs were for a time lost to view, a no-course was called.

Rowdy and Clara were slipped on a hare driven down by the beaters. Rowdy led up, did the work, killed, and won with ease. A quarter mile course.

Meta and Paulina were ordered down again in the All-Age, and ran a three hundred-yards course. Meta thrown out by a turn of the hare at first; Paulina held back a trifle. Meta raced away and got possession, turning. Paulina drew in, but lost to Meta. Meta raced close, wrenched, killed and won. Paulina was a good bitch in all her previous courses. Little was accomplished during the morning. It was now 1 o'clock.

After lunch Catchem and Full of Fun ran a rattling course of over a mile and a half. Catchem led up, Full of Fun got placed, and then it was give and take. Full of Fun earned two go-bys, and Catchem one go-by. In the constant wrenching Full of Fun got to the hare quicker, and held possession longer. Catchem killed. Full of Fun won. At the kill a cottontail was started, and the dogs broke away. Full of Fun led up and killed. Mr. Bartels has a game runner in Catchem, but he does not yet turn handily enough.

Flink and Belle P. now took the slips, amid great excitement. Both dogs were eager and alert, and both looked fit, Belle P. much the better. Flink does not look a thoroughbred, and indeed is not. A good hare was started on the buffalo grass. Flink led up, and placed Belle P. Flink had a trifle the advantage in the early exchanging. Belle P. nearly evened the score within the half mile. Flink took a racing go-by, and held possession for a fast half mile. Belle P. drew in on a turn, and for a time had the best of the exchanging. On soft ground, after the first mile, Belle P. drew away, made a racing go-by, and to the end did most of the work, running game to kill, and turning the hare into Flink's mouth. Belle P. won. Blood tells in the long run, Mr. Page, Belle P.'s owner, while following, ran into a barbed guy wire at a fence corner, and got a shocking fall: his horse was sadly cut up, and he much hurt, though not seriously. Robt. Smart, Flink's owner, who did not see the latter part of the race at all, impugned the judge in vile language. Mr. Bartels proved himself a gentleman, and declined an altercation. At the club meeting that night an unanimous resolution was passed giving the man Smart his choice between expulsion and an ample written apology. In this the club took wrong action. They should have expelled him without recourse. The club has no need for hoodlums.

Rich and Rare and Meta were now put in the slips, and after a short no-course, in which Meta led, were sighted on a good hare. Meta led up to the hare, leaving Rich and Rare. Meta wrenched five times and turned. At the turn Rich and Rare got in, but held possession only a moment; he possibly made one wrench. Meta took a racing go-by, wrenched nine times, turned, and ran all around and away from Rich and Rare for the remainder of the course. The hare was lost for a moment, and when sighted Meta again led till taken up. The hare escaped. Meta won. Rich and Rare was doubtless further down in the runnings than he belonged. Started after five hares, he failed to turned three. This fact would not be worth mention had not Dr. Van Hummel been anxious to find a jack rabbit which Rich and Rare would not turn within 300yds.

A bye race was run between Rowdy and Clara in the fourth series of the Puppy Stakes. Rowdy had the best in a long course.

The winning dogs were now thought unfit to do themselves justice in the deciding courses, and much to the regret of all the last courses were held over till Monday. Had the coursing begun every morning at 9 o'clock instead of 10:30 and 11, this holding over would never have been necessary.

The greater portion of those attending the coursing meeting were forced to leave before Monday. A dozen or fifteen only were on the club grounds Monday morning. The weather was very cold. Meta and Belle P. were called to run the deciding heat in the All-Aged. Meta was withdrawn, lame; Belle P. won, taking championship and cup.

In the closing races of the Puppy Stakes, or "Great Bend Derby," Full of Fun and Plus went into slips. One hare was not sighted; on the second, Full of Fun led and did most of the work. Plus drew in, wrenched and killed. Full of Fun won.

Rowdy and Full of Fun ran a hard no-course into the hills out of sight; a second hare was a grand white-tail on buffalo grass. Rowdy led up and placed Full of Fun. Rowdy again got possession and held it over a long course, the judge sending up his flag while the dogs were still running, Rowdy being clearly winner.

Rowdy won Great Bend Derby.

Full of Fun second.

During the meet all the dogs were fed on Spratts Patent dog biscuits, which gave general satisfaction to the owners. The winners and runners-up in both stakes were trained on this food. It is a comfort to owners sending dogs to be entered to know that they will receive careful attention and the best possible food. This was assured by the club, who will use that food next year also.

Mr. H. C. Lowe, who was one of the judges, is a brother to Mr. Geo. Lowe, of England, whose contributions to the London *Field* and other leading sporting jounals of England (over the name "Leatherhead") are so well known.

In the bench show held at the club house Saturday at noon there were thirteen entries. Mr. H. C. Lowe judged. Mr. C. G. Page's dark brindle bitch Belle P., of Minden, Neb., was awarded first prize for best dog or bitch, and also the special prize offered by the secretary, Dr. Royce, of an elegant pair of English slips, for the best bitch winning in any stake. Belle P. is an elegant bitch, regularly marked in dark tiger brindle. Her head and neck are fine, back well arched, shoulders well placed. She is fine and symmetrical in every way, and was placed right in the decision. Mr. C. Cookson's dog Newton Tip, of Emporia, was given second. This was not a right placing; there were better greyhounds entered. Newton Tip is a fair-looking large dog, but coarse and a trifle throaty; his shoulders are not good, and he lacks symmetry and fineness. His color is a brindle.

At the business meeting of the club on Saturday night the following officers were elected: Pres., Col. David Taylor; Vice-Pres., D. N. Heizer; Treas., J. V. Brinkman; Sec., Frank K. Doan. Ex. Com., G. I. Royce, D. N. Heizer, G. N. Moses. The additional vice-presidents for other States are to be chosen by the executive committee.

There was brought before the club the question of purchasing the Uhl & Carney ranch, where the coursing grounds are now located. This ranch is for sale, and is liable to be sold. If so, the club would doubtless have to go elsewhere, and leave what is probably the finest coursing ground in the world. To the contrary, if the club secured these grounds, stocked them with hares, antelope and other game, appointed a gamekeeper to prevent indiscriminate slaughter of the great number of wildfowl which abound on the flats, to keep down the coyotes and to protect the young hares—in short, if a great game preserve could be made of the wide Cheyenne Flats, then a home and a place would be found at once and permanently for what would soon be the most colossal sporting event of the nation. The ranch schedule as offered is as follows: 8,400 acres of land, grazing and farming; 1,400 head of cattle; one barn, 300x48ft.; one horse barn, 150x30ft.; 60 head of Norman mares and colts; one fine and spacious dwelling house; seven windmills and water tanks; 25 miles of wire fencing. The price asked was $130,000. It was proposed to form a stock company. Forty thousand dollars could be placed in Great Bend at once. Could this project be practically carried through, it would be a grand thing not only for the American Coursing Club, but also for the sporting interests of the entire country.

To fulfill its duty as a chronicler, FOREST AND STREAM begs to remind the members of the American Coursing Club that while they were discussing the best means of raising $130,000, they allowed one of their judges, Mr. T. W. Bartels, to start back for Denver without offering him one cent for his railway fare, either way. Mr. Bartels was courteous and obliging enough, prompt and just enough to deserve better treatment. Of both the judges it may be said that they rode and judged well and fearlessly, and were a credit to themselves and the meeting.

Comparing the meeting with that of last year, an improvement of more than 100 per cent. is manifest in every particular. The entries were more numerous, the attendance was greater, the rules were better followed; everything went more smoothly, and everything pointed to a growing strength and steadiness. Great Bend should—what any other town in Kansas would do—raise a purse of $1,000, or even $500, for competition. Nothing will bring men, or even dogs, together quicker than money; nothing else will do so at all. Visiting sportsmen were well treated by the citizens of Great Bend. The members of the club and citizens alike treated the representatives of the press with the greatest kindness. FOREST AND STREAM is pleased to note these pleasant features, and to congratulate the club on the wonderful growth of the past year, as well as the brilliant prospect for the building up of a grand national sporting event.

Following is the summary of runnings:

SUMMARY.

ALL-AGED STAKES (AMERICAN FIELD CUP).

First Series.

Robert Smart's black dog Flink
beat
R. D. Saulsbury's white and fawn dog Leo.

D. N. Heizer's white dog Demon
beat
J. V. Brinkman's brindle and white bitch Constance.

L. Zutavern's black bitch Thorna
beat
C. F. Cluver's brindle dog Full of Fun.

M. E. Allison's red fawn dog Terry
beat
I. D. Brougher's brindle bitch Do or Die.

D. Taylor's black dog Midnight
beat
W. W. Carney's red fawn dog Barney.

C. G. Page's brindle bitch Belle P.
beat
A. C. Schermerhorn's black and tan dog January.

R. D. Saulsbury's brindle bitch Lady in Black
beat
B. M. Mutersbaugh's black bitch Dina Black.

H. C. Lowe's brindle dog Newton Tip
beat
P. Daugherty's brindle dog Clumsy Jack.

Dr. Q. Van Hummell's brindle and white dog Rich and Rare
beat
G. I. Royce's mouse bitch Honey Bee.

C. G. Page's mouse and white dog Pedro
beat
M. E. Allison's red fawn dog San Pedro.

M. E. Allison's red fawn dog Sandy Jim
beat
G. I. Royce's mouse bitch Humming Bird.

A. C. Fair's black dog Fleet Aleen
beat
Ed. Tyler's black dog Bounce.

R. D. Saulsbury's black and white bitch Meta
beat
D. C. Luse's red fawn dog Sport Aleen.

D. C. Luse's fawn bitch Lavina
beat
G. N. & E. R. Moses's mouse bitch Flirt.

D. C. Luse's red fawn bitch Paulina
beat
A. S. Allen's light fawn dog Jim Blaine.

A. Massey's brindle bitch Gipsy
beat
F. K. Doan's fawn and white dog Tat.

Second Series.

Flink beat Demon.
Terry beat Thorna.
Belle P. beat Midnight.
Newton beat Lady in Black.
Pedro withdrawn.
Rich and Rare a bye with Honey Bee.
Fleet Aleen beat Sandy Jim.
Meta beat Lavina.
Paulina beat Gipsy.

Third Series.

Flink beat Terry.
Belle P. beat Newton Tip.
Rich and Rare beat Fleet Aleen.
Meta beat Paulina.

Fourth Series.

Belle P. beat Flink.
Meta beat Rich and Rare.

Deciding Heat.

Meta withdrawn. Belle P. won championship and cup.

PUPPY STAKES (GREAT BEND DERBY).

First Series.

Amos Johnson's black bitch Dina Black
beat
D. N. Heizer's black bitch California Bell.

W. J. Dixon's black bitch Plus
beat
B. M. Mutersbaugh's brindle and white bitch Lady Estelle.

Mrs. L. F. Tyler's black dog Tippecanoe
beat
S. J. Shaw's fawn bitch Lavina.

H. P. Typer's black dog Colonel
beat
A. Laidlaw's mouse bitch True Foot.

T. W. Bartels's black dog Catchem
beat
E. A. Rowell's black dog Dick Taylor.

G. I. Royce's black bitch Widow in Weeds
beat
A. J. Buckland's white and fawn bitch Ruby.

T. C. Luse's black dog Full of Fun
beat
Geo. Spencer's mouse dog Dandy.

W. W. Egnew's white bitch Lady Dublin
beat
C. P. Townsley's mouse dog Bob.

B. M. Mutersbaugh's fawn bitch Baby May
beat
E. W. Moses's brindle bitch Lady Gray.

M. E. Allison's fawn dog Rowdy
beat
O. B. Wilson's fawn dog Minus.

D. C. Luse's red fawn bitch Clara
beat
F. Zutavern's white and red fawn bitch Jessamine.

J. W. Brown's dog Hal T. disqualified.

Second Series.

Plus beat Dina Black.
Tippecanoe beat Colonel.
Widow in Weeds withdrawn.
Catchem a bye with Dick Taylor.
Full of Fun beat Lady Dublin.
Rowdy beat Baby May.
Clara a bye with Hal T.

Third Series.

Plus beat Tippecanoe.
Full of Fun beat Catchem.
Rowdy beat Clara.

Fourth Series.

Full of Fun beat Plus.
Rowdy a bye with Clara.

Deciding Heat.

Rowdy beat Full of Fun, and won.
Full of Fun second.

RICH AND RARE—SANDY JIM MATCH.—Hutchinson, Kas., Oct. 29.—*Editor Forest and Stream:* The match race between Dr. Van Hummell's greyhound Rich and Rare and my champion Sandy Jim for a purse of $100, best two in three, on the grounds of the American Coursing Club, the 28th inst., was forfeited to Sandy Jim, the Doctor failing to put in an appearance. The forfeit money, $40, was paid over and Sandy Jim declared the winner.—M. E. ALLISON.

SAWDUST FOR DOGS.

Editor Forest and Stream:

Mr. Oesterreich has pointed out a source of danger to dogs in the use of sawdust for bedding, and I wish to show where that same material is very useful. It is no small job to thoroughly dry a dog after washing, and without it washing is of more harm than good. Let whoever has this job on hand get a quantity of very fine sawdust, from thoroughly dry wood, such as comes from a scroll saw at a cabinet factory, and after roughly drying the dog with a towel, thoroughly rub his coat with the sawdust, working it clear to the skin, throw a cloth over the dog for a few minutes and then brush the sawdust out. Generally it will be found that the coat is perfectly dry after one application, but if a second is needed it is no great job. I have found it to work perfectly well with both mastiffs and bobtails; how it would work with satinette dogs like spaniels and setters I don't know. I was first led to this by the difficulty experienced in quickly drying a horse wet with sweat in winter, and somehow stumbled on this. Pine wood dust is the best, as being the more absorbent, but any kind will do, but it must be from thoroughly dry wood and the finer the better. W. WADE.

HULTON, Pa., Oct. 29.

IMPORTED KINO.—Brooklyn, Oct. 28.—*Editor Forest and Stream:* Will Mr. A. C. Krueger say on what authority he advertises the great beagle Kino as "imported," when it is commonly known his importation consists in having been imported into Canada from the U. S. and back again here.—MALCOM.

PHILADELPHIA K. C. FIELD TRIALS.

Editor Forest and Stream:

The following are the entries up to date for fourth annual field trials of the Philadelphia Kennel Club:

ALL-AGED.

(PROFESSIONAL HANDLERS ALLOWED.)

MOLLY BAWN (Chestnut Hill Kennels), red Irish setter bitch (champion Glencho—Biddy).

BEGORRA (Chestnut Hill Kennels) red Irish setter dog (champion Blarney—Lady Clare).

GOLDEN ROD (J. H. Winslow), lemon and white pointer bitch (Beaufort—Zuba).

BELLE (Geo. Esherick), lemon and white pointer bitch (Temple Bar—Belle).

BETSEY LEIGH (Wm. H. Child), red Irish setter bitch (Bruce—Leigh Doane II.).

LURAY (I. H. Roberts), red Irish setter bitch (Chief—Leigh Doane).

GREOLE (I. H. Roberts), red Irish setter bitch (Grafton—Megg).

BRUCE (I. H. Roberts), red Irish setter dog (Elcho—Noreen).

PRINCESS ALBA (E. Comfort), English setter bitch (Chalkly D.—Cassino Gladstone).

MEMBERS' STAKE.

(ALL ENTRIES TO BE HANDLED BY THEIR OWNERS.)

VOLLEY (Col. B. Ridgway), English setter bitch (Antic—Princess Mix).

CASSINO GLADSTONE (E. Comfort), English setter bitch (Gladstone—Countess Druid).

CLYDE T. (L. Shuster, Jr.), English setter dog (Thunder—Cornelia).

DERBY.

(OPEN TO ALL DOGS WHELPED AFTER JAN. 1, 1886). PROFESSIONAL HANDLERS ALLOWED.

BRUNETTE (J. H. Winslow), black and white pointer bitch (Graphic—Zitta).

TUHANA (J. H. Winslow), lemon and white pointer bitch (Guess—Viola).

CHARLIE WESTCOTT (Chas. H. Clark), black and white English setter dog (Chalkly D.—Cassino Gladstone).

BETSEY LEIGH (Wm. H. Child), red Irish setter bitch (champion Bruce—Leigh Doane II.).

WINNIE II. (Chestnut Hill Kennels), red Irish setter bitch, imported (Frisco—Grouse).

DESMOND II. (Chestnut Hill Kennels), red Irish setter dog, imported (Frisco—Grouse).

LEIGH DOANE III. (I. H. Roberts), red Irish setter bitch (Bruce—Leigh Doane II.).

PRINCESS ALBA (E. Comfort), English setter bitch (Chalkly D.—Cassino Gladstone).

WM. H. CHILD, Sec'y.

WESTERN FIELD TRIALS ENTRIES.

FOLLOWING is a list of the entries in the All-Aged Stakes of the Western Field Trial Association, to be run next week. We also re-publish the entries for the Derby, as the former list was not complete in description:

ALL-AGED STAKE.

DANA (G. J. Gray, Kansas City, Mo.), pointer bitch, 1½yrs. (Corner Stone—Nellie True).

ROD (Castleman Kennels), pointer dog, 3yrs. (Meteor—Dell).

CORNER STONE (A. A. Whipple, Kansas City, Md.), pointer dog, 3yrs. (Meteor—Accident).

SPOT (J. B. C. Lucas, St. Louis, Mo.), pointer dog, 4yrs. (Drake—Fan).

SPRING (R. M. Hutchings, Galveston, Tex.), pointer dog, 2yrs. 4mos. (Mainspring—Curfew).

RUBY BUCKELLEW (T. W. Stoutenburgh, Davenport, Ia.), English setter bitch, 2yrs. 3mos. (Buckellew—Brimstone).

KING NOBLE (J. I. Case, Jr., Racine, Wis.), English setter dog, 4yrs. (Count Noble—Rosalind).

KING'S MARK (J. I. Case, Jr., Racine, Wis.), English setter dog, 1½yrs. (King Noble—Belle Belton).

KING'S DAN (J. I. Case, Jr., Racine, Wis.), English setter dog, 2yrs. (King Noble—Elsie Belton).

QUEEN NOBLE (J. I. Case, Jr., Racine, Wis.), English setter bitch, 1½yrs. (King Noble—Belle Belton).

DIXIE BELTON (J. I. Case, Jr., Racine, Wis.), English setter bitch, 2½yrs. (Dick B.—Belton).

DUQUESNE (A. S. Bishop, Pittsburgh, Pa.), English setter dog, 2½yrs. (Doncaster—Flirt).

BESSIE B. (Laredo Kennels, Racine, Wis.), English setter bitch, 2½yrs. (King Noble—Elsie Belton).

RODERICK (Laredo Kennels, Racine, Wis.), English setter dog, 2½yrs. (King Noble—Elsie Belton).

BOHEMIAN GIRL (W. G. Mellin, Kansas City, Mo.), English setter bitch, 2½yrs. (Count Noble—Mollie Belton).

DERBY.

TRINKET COUNTESS (Paul Franke, St. Joseph, Mo.), pointer bitch (Croxteth—Trinket).

LASSIE JEAN (A. J. Gleason, Alma, Kas.), pointer bitch (Corner Stone—Gertrude).

BELLE C. (C. T. Allcutt, Kansas City, Mo.), pointer bitch (Corner Stone—Gertrude).

COUNT C. (J. I. Case, Jr., and F. K. Bull, Racine, Wis.), English setter dog (King Noble—Elsie Belton).

CAPTAIN NOBLE (J. I. Case, Jr., and F. K. Bull, Racine, Wis.), English setter dog (King Noble—Elsie Belton).

KING MARK (J. I. Case, Jr., and F. K. Bull, Racine, Wis.), English setter dog (King Noble—Belle Belton).

QUEEN NOBLE (J. I. Case, Jr., and F. K. Bull, Racine, Wis.), English setter bitch (King Noble—Belle Belton).

BLUE CHIEF (J. I. Case, Jr., and F. K. Bull, Racine, Wis.), English setter dog (King Noble—Elsie Belton).

RODERICK (J. I. Case, Jr., and F. K. Bull, Racine, Wis.), English setter dog (King Noble—Elsie Belton).

JILL (J. I. Case, Jr., and F. K. Bull, Racine, Wis.), setter bitch (Dashdale—Bonfil's Dot).

ROSE (Branch Martin, Little Rock, Ark.), English setter bitch (Little Dan—Bet).

PRIDE OF M. (R. M. Hutching, Galveston, Tex.), pointer (Bang Bang—Zannetta).

LITTLE GIFT (Bert Crane, Chicago), English setter (Rodrigo—Queen Bess).

PRAY'S GLADSTONE (J. A. Bolen, Kansas City), English setter (Paul Gladstone—Bessie A).

HATTIE WEST (J. A. Bolen, Kansas City), Irish setter bitch (Bush, Jr.—My Maud).

VAN HORN (George McConnell, Chicago), Irish setter (Brust, Jr.—My Maud).

LADDY (W. T. Bowdre, Memphis, Tenn.), English setter (Roderigo—Bo-Peep).

SAMUEL S. (W. T. Bowdre, Memphis, Tenn.), English setter (Paul Gladstone—Lottie).

OLLIE S. (W. T. Bowdre, Memphis, Tenn.), English setter bitch (Paul Gladstone—Lottie).

BERTRAM (W. B. Stafford, Trenton, Tenn.), (Guess—Viola).

NELL (R. S. R. Randolph, Trenton, Tenn.), (Guido—Bell).

GRAPHIC III. (Graphic Kennels, Netherwood, N. J.), pointer (champion Graphic—Bloomo).

FRIVOLITY (Graphic Kennels, Netherwood, N. J.), pointer (Donald—champion Revel III.).

MISS GLEE (Graphic Kennels, Netherwood, N. J.), pointer bitch (Bracket—Nell of Efford).

BABE GLADSTONE (F. N. Wood, Kansas City), lemon belton setter bitch (Paul Gladstone—Bessie A.).

STELLA JACKSON (R. C. Van Horn, Kansas City), pointer bitch,

JESSIE B. (R. C. Van Horn, Kansas City), Irish setter bitch (Patsy D.—Betsy Crafts).

RENÉ (Will Davidson, Memphis, Tenn.), English setter bitch (Paul Gladstone—Lottie).

SILK B. (W. B. Gates, Memphis, Tenn.), (Roderigo—Lady Rake).

HUBERT (E. C. Sterling, St. Louis), pointer (Mainspring—Dell).

BELLE OF KANSAS CITY (Drury Underwood, Kansas City), English setter bitch (Paul Gladstone—Bessie A.).

MOLLY, JR. (A. T. Harridge, Alma, Kansas), pointer bitch (Frank—Flora).

A. K. C. CONSTITUTION.

PHILADELPHIA, Pa., Oct. 29.—*Editor Forest and Stream:* Herewith inclosed find copy of the proposed amendments to the Constitution of the A. K. C., to be acted upon at the December meeting. As it is impossible by correspondence to get at the views of the members, I would suggest that your columns would be the best means of criticising the proposed amendments, and should be pleased to hear from any one interested in the A. K. C.—WM. H. CHILD.

AMENDMENTS TO CONSTITUTION.

ARTICLE IV.

Sec. 1. Second line on page 6, for "ten" substitute "thirty."
Sec. 2. Strike out all after "Club Secretary."

ARTICLE V.

Sec. 1. Strike out all after "Each Club."
Strike out Sec. 2.
Sec. 3. For "Executive Committee" substitute "Association." Strike out "two," and for "Vice-Presidents" substitute "Vice-President."
Sec. 4. For "Secretary and Treasurer" substitute "Secretary-Treasurer."
Sec. 6. Lines 6 and 7, strike out "for which each meeting shall be called, and"
Sec. 7. Strike out "in person."

ARTICLE VI.

To first clause add: "Ten days' notice must be given of such special meeting."
Second line of second clause; strike out "preside at all the meetings of this association, and"

ARTICLE IX.

Strike out "or delegate."

ARTICLE X.

For "on or before December 1st" substitute "at or before the annual meeting." For "vote for Executive Committee" substitute "representation at said annual meeting."

AMENDMENTS TO BY-LAWS

Sec. 1. Change "6" and "7" to "7" and "8," and insert "6, Election of Officers."
Sec. 2. Strike out "Standing" in order of business, No. 5. Strike out "6, Report of Special Committees," and "8, Election of Officers." Change "7" "9," and "10" to "6," "7" and "8."
Sec. 3. Second line on page 11, after "Committee" insert "of which ten days' notice must be given to the parties in interest." Second clause, second line, for "those" substitute "such."
Sec. 4. Strike out entire section.
Sec. 5. Second line, strike out "regular." Omit remainder of section after "members present."

AMENDMENTS TO RULES.

Rule 2. Strike out the first sentence and substitute "Every dog entered at any show held under these rules must be the bona-fide property of the person making such entry on the day of closing the entries." Omit comma after "exhibited" on fourth line, and insert commas before and after "if known," on fifth line.
Rule 3. After word "Catalogue" on fourth line insert "together with a list of all prizes won by the dog."
Rule 4. For "may" on third line substitute "shall."
Rule 5. After "owning" insert "or leasing."
Rule 6. Omit comma after "open class."
Rule 10. For "room" on the fifth line substitute "building."
Rule 11. After "surgeon" substitute period for comma.
Rule 12. Fourth line, for "dog" substitute "dogs."
Rule 13. Add "All the separate classes of any one breed of dogs must, however, be adjudicated upon by the same Judge, or Judges acting in conjunction."
Rule 15. On third line strike out "Miscellaneous classes." On fifth line after word "which" insert "together with these rules." On sixth line after "list" insert "and catalogue." Add to rule: "Provided that such prizes have been won in classes confined to one recognized breed."
Rule 16. On fourth line for "noon" substitute "P. M." Strike out all after word "Show" on sixth line.
Insert a new Rule 17 as follows: "Any show held under American Kennel Club rules other than by a club, member of the Association, shall be recognized for the purpose of qualifying for the champion class provided the amount of cash premiums offered at such show shall amount to $500.00, exclusive of special prizes."
Rule 18. Strike out from beginning to and including the word "and" on third line. Strike out the second clause beginning "Stud dogs."
Rule 21. Strike out on second line beginning with "exhibitor" to word "Association," and substitute "person." Add to rule as follows: "No objection shall be entertained unless accompanied by a deposit of $5.00, except in the case of objection lodged in the name of the American Kennel Club." In first line of second paragraph insert word "show" before "committee."
Transpose the words "provided any such member is not on the show committee," and insert after word "present" at the end of fourth line.
After the word "available" on third line on page 16 insert "If the second decision is adverse to the appellant, the deposit of $5.00 is thereby forfeited to the show committee."
Begin new paragraph with the words "If the objection," and insert after word "receipt" "Five days' notice of the date and place of meeting for that purpose must be given to all parties in interest."
Strike out remainder of clause and substitute:
"From any decision rendered as provided for in the foregoing two clauses appeal may be taken to the full Executive Committee of the American Kennel Club. Such appeal must be sent to the Secretary within seven days of the decision being rendered, accompanied by a deposit of $10.00, which shall be forfeited to the American Kennel Club should the previous decision or decisions be sustained. If the appeal is allowed all deposits must be returned to appellant."
Rule 22. On third line substitute "suspended" for "disqualified." On fourth line strike out "where the fault is committed." On fifth line substitute "suspension" for "disqualification." On twelfth line for the word "penalty" substitute "suspension." At close of second paragraph add: "The committee of the American Kennel Club are, however, empowered to use such discretion in the enforcement of this penalty as shall protect innocent parties."
Add a new rule as follows: "No person under suspension or sentence of disqualification can exhibit or take a prize at any show held under these rules."
Rule 23. Add "The partners in a kennel will be deemed equally culpable in the case of fraud perpetrated in the kennel name."
Rule 24. Add "Each of these officials, except paid employes, shall be held personally responsible for the payment of all prizes within sixty days from the last day of the show. The Secretary of the American Kennel Club shall, upon evidence being produced that any such prize or prizes remain unpaid, issue notice of suspension of each and every official, and otherwise proceed as provided for in Rule." (Present Rule 22).
Insert new Rule: "The person presenting the identification ticket shall be recognized as the agent of the owner in the latter's absence, and his receipt for prize money shall be binding on the owner, unless notice to the contrary is indorsed on the identification ticket."
Amend Rule 25 to read as follows: "All prizes offered by the Club or committee in charge of a show must be paid in accordance with the description given them in the premium list. Medals of silver or gold must be of the purity of United States coin."
For list of recognized shows substitute the following as being complete to date. This list is to be added to from time to time by the Secretary as shows are held in accordance with the rules of the American Kennel Club. All shows are to be listed in alphabetical order, and list supplied to all applicants.

Baltimore Kennel Club, 1878.
Boston, Massachusetts Kennel Club, 1878 to 1882.

Washington, 1883, 1884.

BENCHERS AND FIELDERS.

Editor Forest and Stream:

Writers in the different sportsmen's papers throughout the country are continually casting slurs upon what they style "benchers," etc., and leading uninformed persons to infer that a prize winner at a bench show is about as useless in the field as a stuffed dog, or to put it as one owner of a prize winner some time ago wrote, "As if he was taking a brass statue through the country to win prizes." This, as any well-informed man knows, is most unjust to the prize winners. Let us just notice some of our bench show winners. Of course I refer to sporting dogs. To begin with pointers, the great Beaufort, despite his misfortune (as our anti-bench show man would style it) of being "champion of the world," was good enough to win a place at the Eastern Field Trials. Champion Graphic is also weighted with many a prize; but he managed to win all his heats until drawn. Robert le Diable is a champion on the bench and in the field. Naso of Kippen is a fine field dog, as his record shows. Bang Bang is also guilty of winning on the bench. Sensation was a field dog. Bradford and Tammany have won in field trials.

Then take English setters. Foreman is a champion on bench and in field. Plantagenet won heats when run in the E. F. T. C. Rockingham, I believe, is a good fielder. Royal Albert is entered for the field trials this year; Royal Prince II. also. Paul Gladstone has a double record. Champion Mandan won a place at the Manitoba Trials. Every one knows Gladstone's record. London could win in field or ring. The great Roderigo can get into money on the bench; Gus Bondhu also. Cora of Wetheral is entered for the trials this fall. Poor Dido II. was a fielder. Lillian can win on the bench. The Irish setter champion Chief is a trial winner. I believe Tim is a good field dog.

Irish water spaniels I do not know about, although one prominent exhibitor of them claimed that his were "non-sporting" dogs when he saw a chance of winning a special.

In Clumber spaniels, Johnny is a worker that is bad to beat, and Drake runs him close. Judy was a capital field dog. Mr. Pier's Clumbers can win on the bench, and they are noted for their field qualities. Ben was a perfect field dog, and Joan has had many a day in covert. The field spaniel champion Black Prince is a splendid worker. The cocker Hornell Silk is styled "champion field spaniel of America" by default. Obo II., I believe, is a fielder. Obo, Jr. can do a day's work.

Mr. Cook's pack of foxhounds make a clean sweep when shown, yet they are said to be as good as they look.

The beagles Cameron's Racket, Bannerman and Trailer can do good work. Memnon has a double record.

I trust no one will accuse me of not mentioning this dog or that, as I have merely dotted down names of those that I thought of while writing and know to be field dogs, although guilty of receiving honors at bench shows. C.

MASTIFFS.

Editor Forest and Stream:

The following from Mr. R. A. Craig is too good to be lost, and with his kind permission I send it to you: "Our kennels are on the shore of a lake near a village of 2,000 inhabitants. Lately there have been several petty burglaries. About a week ago the kennelman heard a great noise; the dogs had burst the doors open (Phædra, Persephone, Corsair and Vixen). He opened the window, and saw in the moonlight two men up to their middles in the water and the dogs on the bank growling. In response to his questions, the men said they were merely taking a walk. There was no thoroughfare—all private property and 2:30 A. M.—so he told them to stay there till morning, put down the window and went to bed. In the morning the dogs were there, but the men had either waded along the shore or had swam off."

W. WADE.

HULTON, Pa., Oct. 20.

A MARTYR TO DUTY.—I doubt not your readers will share in our regret at the loss of an active and valued friend of this institution, who, on the 15th inst., fell a victim to his devotion and zeal in a good cause. I refer to that intelligent terrier, Tartar, late the property of Mrs. Burt, of the Eglinton Arms, who, between New Year's Day and the date of his untimely death, collected no less a sum than £12 2s for us. Tartar had a collecting-box, which he regarded as being in his special charge, and for which he actually canvassed the frequenters of his master's and mistress's house with dogged persistence, and with a persuasiveness of expression which seemed to say, "You can't refuse a poor dog a trifle for our old infirmary." Such an appeal was hardly to be resisted, and the coin given or thrown to him was promptly seized or recovered and dropped through the slit, which was the doorway to his treasury. A post mortem examination disclosed that death had resulted from the effects of one or more pennies inadvertently swallowed in his anxiety to secure them for his box. While I write, his picture, taken with his box beside him, is before me. We regret, and his mistress laments, the loss of a friend. If in accociation with his memory it is not forgotten that what a dog has done dogs may do, Tartar will have left behind him the encouragement of a good example—a valuable bequest to man as well as dogs.—CHARLES S. GRAHAM, Secretary Bristol Royal Infirmary.—*Stock-Keeper.*

AMERICAN TOY DOG CLUB.—*Editor Forest and Stream:* The organization meeting of the American Toy Dog Club will be held at 221 West Thirty-eighth street, New York, on Tuesday, Nov. 15, at 3 o'clock. All interested in these little house pets are invited to be present. Ladies and gentlemen in and out of town who may not be able to attend the meeting but desire to become members, will please assist in the organization by writing and stating their views to the secretary at the above address. Members will be enrolled and officers elected for the ensuing year. A large attendance is expected.—W. ROBINSON, Sec., pro tem.

DR. PIGEON.—*Editor Forest and Stream:* Can any of your readers give me the address of Dr. Pigeon, an English mastiff fancier, who came to this country a few years since? —W. WADE (Hulton, Pa.),

WINSTED DOG SHOW.—*Editor Forest and Stream:* H. Clay Glover will judge pointers and setters, and James Watson all other classes at Winsted, Conn., Dec. 14-16. The managers have arranged with W. Tallman to feed the dogs with Blackstone Food. Premium lists will be ready Nov. 4. —F. D. HALLETT, Secretary.

DOG LOST.—The English setter bitch Forest Dora (A. K. R. 500), blue belton, 5yrs. old (champion Dick Laverack—Forest Fly), belonging to Rosecroft Kennels, Birmingham, Conn., was stolen Friday evening, Oct. 28. Any trace of her will be thankfully received by G. E. Osborne, Birmingham, Conn.

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

DEATHS.

Kerry Gow. Red Irish setter dog (A.K.R. 5190), owned by Geo. E. Alexander, Pawtucket, R. I.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

L. W., N. Y.—1. At what age is it best to commence to train a dog? 2. I have an Irish setter who for the last six months has had inflamed eyes which matter every day; he also has a skin in the lower corner of both eyes. Ans. 1. You can commence teaching a dog to mind at four to six months. 2. Wash eyes with borax and glycerine and drop a little solution of zinc sulphate and water (two grains to the ounce) in the eyes night and morning.

C. D. R., Woodbridge.—My bulldog has been troubled for about two weeks. Small spots appear on back and neck at first, matterate and dry up and the hair comes off, leaving the skin rough and sore, and spread in large patches. I am washing with castile soap and give five drops Fowler's solution night and morning. Ans. Keep on with Fowler's solution. Rub the spots lightly with balsam of Peru ointment night and morning after washing.

H. F. S., Brooklyn, N. Y.—Do not give raw meat to dogs when not working. Your feeding is good. Mix a small amount of meat in the meal while cooking. Cleanse the water pail every other day. This is probably the cause of the trouble. Get the following:

R.	Ext. nucis vom	grs. iii.
	Quin sulph	grs. xxiv.
	Capsici	grs. xii.
	Ipecacuanhæ	grs. i.

Mix. Fit pill No. 12. Sig. Give one pill three times daily concealed in a morsel of meat.

WELL BRED ST. BERNARDS.—Mr. Rodney Benson offers some well bred St. Bernard puppies for sale in our advertising columns. The sire, Bonivard, has a record of over 40 first prizes and cups won in England and America, and some, if not all of these youngsters should make their mark on the show bench.—*Adv.*

Rifle and Trap Shooting.

Address all communications to the Forest and Stream Pub. Co.

RANGE AND GALLERY.

THOMASTON, Conn., Oct. 22.—Three members of the Empire Rifle Club were present at the range this P. M. The scores below show the want of practice. A good light, with a gusty wind from 3 to 9 o'clock:

Fred A Perkins	6	8	6	5	6	8	8	5	5	5—62
A S Hubbard	7	5	5	5	5	7	4	5	5	6—54
G P P North	7	5	5	4	5	7	5	8	0	5—51

Hubbard was using a gun he never saw before, and has not shot at a target in two years.—FRED. A. PERKINS.

Oct. 29.—A beautiful day for rifle shooting, but only two members present at the range. Off-hand, 200yds., standard target. We use only the target center.

Fred A Perkins	7	6	5	8	5	7	6	8	7	7—66
C F Williams	10	6	7	0	7	6	4	5	4	5—54

WORCESTER, Mass., Oct. 29.—The attendance at the meet today at Broad Meadow Range was not large. The Creedmoor target was used, distance 200yds., with a possible score of 50. The work in detail was a follows:

Sporting Rifle.		Military Rifle.	
A C Brown	4555555555—49	C M Hunt	4454454444—42
	5555453555—49		4543535345—41
		Macomber	4454543444—39
		Jones	4434543534—39

CREEDMOOR, Oct. 29.—The twelfth Marksman's Badge match of the National Rifle Association was shot to-day. The attendance was very large. The weather was very fine and mild, which was very favorable for shooting. The scores made were very good. Following are scores of 42 and over; the winners of the match are those marked *:

	200yds.	500yds.	Total.
*T J Dolan, N C S, 12th Regt	24	24	48

The last opportunity to qualify this season will be on Tuesday, Nov. 8 (Election Day), open all day, commencing at 8:30 A. M.—J. MANZ, Jr., Ass't Sec.

NEVADA VS. CALIFORNIA.—In a friendly match to have been shot Oct. 16, between ten members of the Nevada Rifle Association of Virginia City, and a like number of the National Club of San Francisco, the Nevada team made the splendid score of 824 points, each man firing ten shots at both the 200 and 500yd. targets:

	200	500		200	500
M H Burke	44	47—91	Thomas Uren	42	43—85
J Ferris	45	44—89	X Stocker	42	45—87
S Curnew	44	46—90	J D Cameron	44	47—91
J E Wratten	44	42—86	J Spargo	43	47—90
B J Jenesy	42	39—81	H Cardew	44	50—94—884

It will be seen by the above that Cardew made the best individual record, scoring a possible 50 at the 500yd. target, which is the first time in the history of target shooting contests between rival teams when ten consecutive bullseyes were scored at either target. In the two sighting shots allowed each member of the team, Cardew's shots were also bullseyes. He was also winner of the weekly 500yd. target and aggregate medals. Several dispatches were sent to the Secretary of the National Club asking him to wire the score made by the San Francisco team, but no answer was returned. When the mail arrived a letter was received dated Oct. 11, in which the writer stated that it would be impossible for the National Club team to shoot on the 16th. On Oct. 6, Secretary Tickell of the Nevada team, received a letter from the secretary announcing that the proposition to shoot was accepted. The shooting of the Nevada Rifle Association's team was therefore done under the impression that the Nationals were contesting with them for supremacy as marksmen. Under these circumstances Secretary Tickell has decided to send the target to the California team to show its members what kind of shooting they must do to expect to win in a contest with the Nevada Rifles.

PHILADELPHIA, Oct. 21.—The Lancaster Schuetzen-Verein visited the North End Rifle Club at Schoeneck to-day for the purpose of friendly contests and testing their practice at Creedmoor target range of 500yds. A match was arranged between the clubs, seven men being selected from each association to shoot ten shots apiece; the target the standard American, distance 200yds., and possible 100. The scores were as follows:

N. E. Rifle Club.										
H Y Yocum	5	6	10	6	0	0	6	5	9	0—47
D R Hagy	6	0	7	9	0	0	6	9	9	10—56
W Carpenter	6	7	5	10	8	5	7	9	9	7—73
L M Wiest	7	6	6	7	5	4	0	8	4	5—52
C S Wenger	7	8	6	6	9	6	8	4	7	7—68
J A Stober	4	7	8	6	4	0	7	10	0	0—43
W K Romig	7	10	9	7	6	7	5	9	7	6—73
										412
Lancaster S. V.										
Jacob Wolfer	6	9	9	6	7	5	7	8	7	8—72
E C Hall	8	10	5	5	10	8	5	7	6	5—69
Peter Donnel	4	0	10	7	5	5	7	0	4	10—52
Chas Franciscus	9	8	6	8	7	7	7	8	7	7—74
I Carpenter	6	6	4	5	5	5	8	5	6	6—56
J J Fritsch	0	6	5	9	7	0	5	0	0	5—37
J W Mentzer	0	6	0	7	6	7	0	4	0	4—34
										394

A second match was next arranged for practice at same target, same distance, with the possible but 30, and the following is the score:

N. E. Rifle Club.		Lancaster S. V.	
C S Wenger	4 9 10—23	J F Wolfer	10 4 6—20
L M Wiest	5 9 6—20	E C Hall	6 8 7—20
W Carpenter	6 7 7—20	P Donnel	6 5 8—19
H B Keller	7 6 10—23	C Franciscus	9 5 8—22
J Stuber	0 5 0—5	I Carpenter	0 7 10—17
G Mohler	8 7 9—24	J J Fritsch	0 6 5—11
L D Hacker	5 6 4—15	J W Mentzer	4 5 6—15
	130		124

Then followed the most interesting match of the day, arranged by selecting two mixed teams, each team comprising representatives of the Schuetzen Verein and North End clubs, 500yds., and possible 25. The scores were:

Kendrick Team.		Mentzer Team.	
C S Wenger	4 5 4 3 5—21	C Franciscus	3 4 4 4 5—20
J F Wolfer	0 3 0 2 0—5	L M Wiest	4 5 5 5 5—24
W Carpenter	4 5 5 3 5—22	J W Mentzer	3 4 4 3 2—16
P Donnel	3 2 3 3 4—15	J A Stager	4 2 4 5 3—18
H Y Yocum	4 5 4 2 5—20	I Carpenter	2 3 3 4 4—16
E C Hall	2 5 0 3 0—10	D R Hagy	3 3 3 2 4—15
E F Bard	3 3 3 4 4—17	J J Fritsch	0 0 0 2— 2
G Mohler	3 2 3 4 4—16	W K Romig	3 2 4 4 5—18
J Stuber	4 4 4 5 4—21	H B Keller	3 2 3 4 3—14
M Kilburn	4 2 3 4 5—18	L R Hacker	3 4 5 4 4—20
	165		163

STOCKTON, N. J., Oct. 27.—The third and final prize competition among the First New Jersey Regiment marksmen was decided to-day at Stockton Rifle Range. The day was rather unfavorable for good scores. The competitions were three in number—August 27, September 24 and October 27. Five prizes to be awarded to the men having the two highest scores (aggregate) at 200 and 500yds., seven shots at each distance. The following are the prize winners:

	200yds.	500yds.	
Sergeant Geo. F. Root, Company F.			
September	3 4 4 4 4 4 3—26	0 3 5 5 5 3 5—26—52	
October	4 5 5 4 4 3 4—29	4 5 2 4 4 5 4—28—57—109	
Sergeant E. T. Linnard, Company D.			
August	3 3 2 4 3 4 5—24	4 4 5 5 5 0 5—28—52	
October	4 4 5 5 4 4 3—29	0 2 3 4 5 5 4—23—52—104	
Corporal H. J. Mehard, Company C.			
September	2 3 4 4 4 4 3—24	5 4 4 4 0 2 2—25—49	
October	3 3 4 4 4 4 4—26	5 3 3 3 4 5 5—28—54—103	
Adjutant P. S. Conrad.			
August	4 3 4 4 3 5 4—27	3 3 3 3 3 4 4—23—50	
September	3 4 4 3 4 4 4—26	2 5 5 3 2 5 5—27—53—103	
Private A. A. Kerns, Company B.			
August	3 4 3 4 4 4 4—26	4 5 4 4 4 5 5—31—57	
September	4 3 3 3 4 4 4—25	2 2 4 4 0 3 5—20—45—102	

ALBANY, Oct. 20.—At Rensselaerwyck rifle range to-day the military match was shot and was won by Private Stephen Schreiber, who is rapidly coming to the front. The weather conditions were fair, and the wind moderate. The conditions of the match were 200 and 500yds., five shots at each distance, military State rifle. There were twenty-three competitors, and the result of the friendly competition showed several excellent scores. The following scores were made:

Pvt S Schreiber, Co B	5 4 5 5 4—23	4 5 5 3 5—22—45
Qm-Sergt B R Spellman, Jr, Co A	4 4 5 4 4—21	5 4 5 3 4—22—43
Pvt E A King, 6th Separate Co	2 3 4 4 4—17	4 5 4 4 4—21—38
Pvt F C Comstock, 6th Separate Co	3 4 2 3 3—15	5 3 4 4 3—19—34
Pvt J A Wells, 6th Separate Co	4 3 3 3 3—16	3 3 5 5 3—17—33
Sergt H M Caswell, 6th Separate Co	3 4 3 3 4—17	3 4 2 2 5—16—33
Pvt T S Hoyt, 6th Separate Co	4 3 4 3 4—18	2 2 3 4 4—15—33
Pvt S Southard, Co A	4 4 4 4 3—19	3 2 0 3 4—12—31
Cor T E Norton, 6th Separate Co	5 3 3 3 4—18	5 2 3 2 0—12—30

BOSTON, Oct. 29.—There was a very large attendance of riflemen at Walnut Hill to-day. Military men were present in large numbers, intent on qualifying, under the conditions governing the militia, before Nov. 1. The day was almost perfect, both as to wind and weather. The score:

Decimal off-hand match—E. Burleigh, 72, Eastman 71, W. H. Oler 67, D. Charden 62.

Decimal rest match—J. N. Frye 111, W. H. Oler 110, J. R. Munroe 110, D. Q. Chase 109, W. Chester 109, H. Joseph 108, P. B. Hunt 106, T. P. Strong 103, B. G. Barker 97.

Military match, 200yds.—J. L. Fowle 43, J. E. Darmody 42, Loundsbury 42, M. G. Witham 42, A. Wright 42, P. B. Hunt 41, Mitchel 40, Stearns 38, H. Delona 35, Cabot 34, Healey 32.

Military match, 500yds.—M. G. Witham 45, F. W. Fowle 41, T. Everett (off-hand) 40, J. E. Darmoody 40, Simmons 39, H. N. Conn 39, Loundsbury 38, C. B. Conn 37, Thayer 37, T. D. Barroll 34, Wright 33.

Military match, 800yds.—Nowell 44, E. L. Dorr, Jr., 32.

State militia match—E. L. Dorr, Jr. 25, M. G. Witham 22, T. D. Barroll 21, F. E. Cabot 20.

Revolver match—F. E. Bennett 87, W. H. Oler 86, J. B. Fellows 85, C. L. Holmes 83, A. C. Gordon 83, P. B. Hunt 83, W. Bennett 83, Stearns 80, Strong 78, A. Loring 75, J. Francis 75.

NEWARK, N. J., Oct. 27.—Scores made by the members of Our Own Rifle Club, at their weekly shoot:

Snellen	115	Bander	98
Fred Friensehner	111	Gill	98
Beyer	110	Coudit	97
Willms	105	Knothe	94
F A Friensehner	105	Smith	94
Drexler	100	J Kiefer	94
Hahn	99	Gutman	89
O A Kiefer	99	Kroeplin	87
Bertram	99	Hunziker	82

PORTLAND, Me., Oct. 20.—The unfinished matches at the tournament of the Maine militia were shot off to-day, and all the troops have left Augusta. The great team feature of the meeting was the novelty match, which was carried to success by a detail of thirty-six men. Last year at the Bangor encampment the team shooting was done by the Frontier Guards, of Eastport, under these conditions: Distance, unknown, 250 to 100yds.; rounds, 10; 5 fired in advancing, 5 fired in retreating, off-hand; third class United States target, thirty-six men. Result: Bullseyes, 16; centers, 151; inners, 121; outers, 45; hits, 333; 2 miss fires, 2 lost cartrides; actual misses, 23; score, 1137. This shooting attracted great attention. Rifle practice inspectors from all over the country became interested. Lieut Reed, inspector of rifle practice for the Missouri Division, U. S. A., wrote a letter to Col. E. C. Farrington, inspector for the Maine militia, complimenting him on the remarkable score and asking specific questions relating to it, all of which were duly answered. At Bellevue, Neb., Aug. 30 to Sept. 9, during the practice of the division teams, Lieut. Reed made a detail of thirty-six men, who eclipsed the Maine record under the same conditions, making a score of 1,400 points. Determined not to be outdone by the regular army, the Maine colonel at Augusta yesterday picked thirty-six crack shots and scored 1,451 points, not a miss, and every bullet counting in the target.

THE TRAP.

Scores for publication should be made out on the printed blanks prepared by the Forest and Stream, and furnished gratis to club secretaries. Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

NARCOOSSEE, Fla., Oct. 24.—There was a fair attendance at the trap on Wednesday afternoon. In shooting off the tie, best out of three clays, Mr. Haycock scored 1, Mr. A. E. Woodham 3. All shot 12-gauge guns, except Mr. A. E. Woodham, who used a 16-gauge. Appended are the scores:

F Vans Agnew	01101—3	E L Drury Lowe	00100—1
H W Atkinson	10010—2	E J Shaw	03000—0
H T Butler	00101—2	F L Woodham	11001—3
W J Statter Carr	00001—1	A E Woodham	11101—4
A H Haycock	10111—4		

SARATOGA, Oct. 22.—Notwithstanding the unpleasant weather to-day six members of the gun club shot clay pigeons at Glen Mitchell with the appended results. The first event, a 200-bird match between Messrs. Pike and Thomas and Messrs. Bockes and Levengston, fifty birds each, was won by the former by fourteen birds, the latter allowing the winners fifteen birds. The score:

Pike	00011001010110000011110010010110011001111100111111—27
Thomas	00100003010101000001001100110110100000111011110—21

Total, including the 15 birds, 48.

Levengston	10010000110011000001001111011111101111010011111010—27
Bockes	00101000010011100030000111011001000010111001011100—22

Individual match at 10 birds each:

Pike	1111101110—8	Bockes	0001001100—3
Levengston	1110011001—6	Meehan	1010000001—3
Thomas	0011111090—5	Re-entry	0010000110—3
Clark	1010100011—5		

Oct. 25.—The gun club held its regular shoot at Glen Mitchell to-day. The club trophy in the 50-bird match was won by Pike, closely followed by Levengston, who secured second prize. The following are the scores in the 50-bird match:

Pike	10011110101101110110101111001101000111011110010—31
Levengston	01010100101011111001000111110100001110100111101—29
Bockes	01011111000011010110011101001000011001000011110—25
Thomas	01100001001101011100001111001000100101100011111—25

Individual match at 10 birds each:

Clark	1111111100—8	Pike	1001101010—5
Bockes	0110111110—7	Thomas	0001111000—4
Levengston	1110111001—7	Meehan	0100010100—3

BROOKLYN, Oct. 24.—Many sporting men to-day went to Stillwell's hostelry, on Coney Island Creek, where the members of the Coney Island Rod and Gun Club held its seventh annual shoot and dinner. Twenty-six members went to the traps to shoot at seven birds each, distance 25yds. H. L. Greenman and E. Magnus killed all their birds and divided first prize. H. Goodwin, E. Bushnell, J. Defrane, E. Rockfeller, J. E. Lake, Dr. Shields, C. W. Jones, W. A. Stuart and H. McLaughlin killed six out of seven. H. Blattmacher, H. Schweickert and H. Donnelly killed five each. It being too late to shoot off the ties the money was divided. After dinner, the president of the club, Mr. H. McLaughlin, said that the Coney Island Rod and Gun Club was one of the largest, if not the largest, shooting organizations on Long Island, and, from the number of members that had joined during the year, he thought that the continued prosperity of the club was assured. The fishing prizes were then presented to those members of the club who had taken the largest striped bass and weakfish from the waters of Gravesend Bay and Coney Island Creek. The first prize, a handsome silver-mounted combination fishing rod, was won by Mr. William Weber, for a striped bass weighing 2½lbs. Mr. Post Van Pelt was the winner of second prize, but waived to claim it, and it was presented to Mr. H. L. Greenman for a 2½lb. weakfish caught in Coney Island Creek. The score of the shoot is as follows:

H McLaughlin	1011111—6	H Schweickert	0111110—5
W A Stuart	1110111—6	P Van Pelt	0001011—3
C W Jones	1101111—6	W Weber	0001100—2
A Rockfeller	1101010—4	E Magnus	1111111—7
Dr Shields	1111110—6	W White	0001100—2
J E Lake	0111111—6	J White	0011000—2
H L Greenman	1111111—7	J Simpson	1110100—4
G L Hayes	1010111—4	Judge Courtney	1100101—4
E Rockfeller	1101111—6	Captain Meyer	1001000—2
P Hagadorn	0010111—4	J Stillwell	0100111—4
J DeFrane	0111111—6	E Bushnell	1111911—6
H Donnelly	0111101—5	H L Bushnell	1001010—3
H Blattmacher	1110101—5	H Goodwin	1111101—6

Referee, Mr. H. Laughlin. Scorer, Mr. R. Hooper.

KANSAS CITY, Oct. 20.—The shooting park on the Blue was filled with sportsmen to-day, and in spite of high wind and unfavorable conditions the scores were up to the average. The Kansas City Gun Club medal was won by Major Cross.

D Underwood	1110011001—6	A A Brumbach	0011011011—6
C Bassett	1011100001—5	J E Riley	1111100100—5
J Boland	1110100111—7	J Underwood	0111010001—5
J Dunlap	0111111000—6	A Wetzel	1011100011—6
G Mock	0111111000—6	G Yeomans	1111111100—8
W Shaw	1111010111—7	Major Cross	1111111011—9
F J Smith	1110110100—6		

For the shoot for the Llewellin setter there were 15 entries. Mr. Baehr did some of the best work seen at the park this season. He shot for himself and two others. There was no shoot-off, the winners agreeing to divide the value of the dog, the entrance netting $75.

W Shaw	1101111111—9	A G Parker	1001101110—6

Visitors' Match.

E J Neal	1001100 110	10 11 00 10 00— 8 G

Sweepstake events.—1. 6 clay-pigeons, Adams first. 2. 6 clay-pigeons, Nichols first. 3. 6 Macomber birds, Stanton and Snow first. 4. 10 Macombers (badge sweepstakes) Adams first, Snow second, Warren and Jones third. 5. 5 pairs Macombers (badge sweepstake) Snow first, Nichols second, Stanton third. 6. 10 clay-pigeons (merchandise sweep) Smith first, Warren second, Stanton and Snow third. 7. 5 pairs bats (Merchandise sweep) Warren first, Smith second, Adams and Nichols third. 8. Walk-up match, 3 pairs clays, Smith first. 9. 6 clay-pigeons, straightaway 35yds., Stanton first. 10. 5 clay-pigeons (Arkenson match) Nichols and Adams first. 11. 5 clays straightaway, Nichols first. 12. 6 clay-pigeons, Stanton and Nichols first. 13. 5 bats, Stanton and Smith first. 14. 6 bats, Stanton first. 15. 6 clay-pigeons, Stanton first. 16. 6 clays straightaway, Stanton first.

OMAHA, Oct. 18.—The general shoot which took place at the Omaha Gun Club grounds this afternoon was participated in by a large number of shooters. First the Penrose and Hardin team, who are practicing for telegraphic matches with Eastern teams, shot a trial shoot of 100 birds, 25 to the man, 18yds. rise, with the following score:

Penrose	1111111111111111111111111—25
Hardin	1110111111111111101101111—22
Petty	1111111111011111113001111—22
Mertz	1011010111111111111111111—21—90

Following this came a general shoot by the following gentlemen:

Penrose	1111111111111111111111111—25
Brewer	1111111101011111111010100—19
Petty	1111111111011111111110100—22
Ketchum	1011110111131111101111111—21
Thompson	1111111010111001010011—18

Hardin	1110111111111111011111111—22

The shoot at double birds resulted as follows:

Hardin	11 11 10 10 11 10 11 11 11 11 11—21
Mertz	11 11 11 11 11 10 11 01 10 11 11—21
Ketchum	11 11 01 00 11 11 11 11 11 10 01—19
Brewer	10 11 10 11 11 10 11 11 10 11 01 01—18

PALATKA, Fla., Oct. 20.—The regular semi-weekly practice of the Palatka Gun Club took place this afternoon on the grounds west of the junction. The wind was a little troublesome, but there was a good sky. The match was shot with standard birds from three traps, 18yds. rise, 10 singles and 10 doubles. After the match an event of singles was shot, the score of which is given with the match score below:

Vertrees	1010010100—4		11 10 00 01 11—6—10
Hawes	0000000101—2		01 11 10 11 01—7— 9
Hargrove	0001100011—4		00 00 00 00 00—0— 4
Dalton	1000101110—5		00 00 11 10 10—4— 9
Bailey	0111111111—9		10 00 00 00 01—2—11
Yeaton	1101110011—7		01 11 10 11 00—6—13
Griffin	1010100111—6		11 01 10 11 11—8—14
Evans	0111111110—8		00 01 11 11 10—6—14

Hargrove	0011100111—5	Griffin	1111110001—7
Dalton	1100101010—5	Evans	1001011000—4
Bailey	1110001110—6		

After the shoot one of the members proposed a match at fever germs, Dr. Ames to secure the "birds."

ALBANY, Oct. 20.—At the shooting tournament at Chatham to-day, which was attended by seven sportsmen from Albany and one from Troy, seven matches were shot out, in which Albany was successful in winning the greater portion of the purses. The first event, at 10 blue rocks, resulted in first money for Bradford. In the second event, at 10 clay pigeons, Gardner won first money. The third event, at 10 glass balls, gave Gardner first money. Fourth event, 10 Peoria blackbirds, Gardner first. Fifth event, 5 double blue rocks, Greer and Skidmore divided first. The live bird event followed with 13 entries, when Gardner and Dunn divided first money. The final match was at 5 double balls, where Gardner secured first money.

WELLINGTON, Oct. 29.—At the weekly shoot of the Wellington club to-day, the following were the winners in the sweepstake matches: First, 6 blue rocks, Swift first. Second, 6 clay pigeons, De Rochemont and Moore first. Third, 6 clay pigeons, Shumway and Swift first. Fourth, 6 blue rocks, Evans first. Fifth, 6 clay pigeons, Stanton first. Sixth, 6 blue rocks, Stanton first. Seventh, 6 blue rocks, Swift and Perry first. Eighth, 6 clay pigeons, Swift first. Ninth, 6 blue rocks, Stanton first. Tenth, 6 clay pigeons, Perry first. Eleventh, 6 blackbirds, Melcher first. Twelfth, 3 pairs blackbirds, Snow, Swift and Perry first. Thirteenth, 6 clay pigeons, Swift first. Fourteenth, miss and out, won by Swift.

BREWER—GRAHAM.—John L. Brewer defeated William Graham, of England, Monday afternoon, Oct. 24, in a match at Merchantville Driving Park. The contest was decided under the Hurlingham rules at 100 pigeons, and was for $200 a side. Graham was shot out on the 91st bird. The score then stood: Brewer killed 81, Graham killed 67. The score follows:

Brewer...2222222121212121111021110121110012121111212111212122011001122211111012102111122111101111—81

Graham...1220100221111102011121100001112000111111111101012111211121102122110110110120012101111111010—67

The referee was Mr. Edward Maher.

UTICA, Oct. 28.—The Oneida County Sportsmen's Club held a prize shoot for the Booth-Ehrsam prizes at Riverside to-day. Following is the score:

Thomas	1101001101001100— 7	Horton	1110011110101111—11
Elliott	1111000101010110— 9	Wheeler	0111101101011111—11
Beck	1110111001011110—10	Rose	1111011111111111—14

Rose won first place and Wheeler second.

DAVIS AND CANNON.—W. C. Cannon, the phenomenal one-arm shooter of the J. C. H. G. C., has got his dander up again. He shot a match some time since, as we reported in your paper, with Geo. Davis, of Greenville, which he lost; but W. C. is plucky and knows not how to squeal. He has made another match with Mr. D., $100 aside, 100 birds each, to be shot at Dunellen on Thanksgiving Day; and Will says he has $100 more in his inside pocket that George does not get away with him this time. As Davis always shoots to win and Cannon means business, it will probably be a good match. We shall try to see it.

BUDD AND GRAHAM have made a match for some time this month at Chicago, 100 birds, Hurlingham rules, $250 a side.

Canoeing.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signal, etc., of their clubs, and also notices in advance of meetings and races, and report of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

AMERICAN CANOE ASSOCIATION.

OFFICERS, 1886-87.

Commodore: R. J. WILKIN, Brooklyn, N. Y.
Secretary-Treasurer: WM. M. CARTER, Trenton, N. J.

OFFICERS-ELECT 1887-88.

Commodore: R. W. GIBSON..... } Albany, N. Y.
Secretary-Treasurer: F. L. MIX.. }

Vice-Com.	*Rear-Com.*	*Purser.*
Central Div..Henry Stanton	R. W. Bailey	E.W. Brown, 146 B'way, N.Y.
Eastern Div..L. Q. Jones	Geo. M. Barney	W. B. Davidson, Hartford.
N'thern Div..A. D. T. McGachen.	W. G. McKendrick.	S. Britton, Lindsay, Can.

Applications for membership must be made to division pursers, accompanied by the recommendation of an active member and the sum of $2.00 for entrance fee and dues for current year ($1.00). Every member attending the general A. C. A. camp shall pay $1.00 for camp expenses. Application sent to the Sec'y-Treas. will be forwarded by him to the proper Division.

Persons residing in the Central Division wishing to become members of the A. C. A., will be furnished with printed forms of application by addressing the Purser.

A BOAT FOR SAILING AND CRUISING.

THE many inquiries concerning sneakboxes, tuckups, small sharpies and similar craft that constantly come to us show that there is a general demand for small sailing craft of good design, both for ordinary pleasure sailing and for more or less extended cruising. This demand may be largely ascribed to the influence of canoeing, as it has arisen since the latter sport became generally popular in this country. There are many to-day who have given up the canoe after a fair trial, and many more who are ready to do so, but this is not on account of any defect in the boat. The general popularity of canoeing, together with the moderate expense, leads many novices into it not because it is just the form of sailing which they prefer, but because they know of no other which would suit them better. After a time some find the canoe too small to carry a party of friends, others wish a boat exclusively for sailing in open waters, and others again wish to carry an amount of stores, guns and tackle, for which the canoe never was intended. This proves nothing against the canoe, a boat adapted to wider range of use than any other pleasure craft, but when a man gets to this stage and begins to long for a sneakbox or a sharpie, he is better out of a canoe than in it, though there is no reason why the bond between him and the man who still swears by a 15x30 canoe should be severed; they are both cruisers and sailors at bottom, though their craft may vary.

THE FOREST AND STREAM has given many designs of small craft, the sneakbox family in particular having been very thoroughly described, but it is evident that the perfect boat has not yet been reached. Some correspondents have lately asked about the Delaware River tuckup, believing it to be adapted to general cruising purposes, but without going fully into a description of these boats, a little will serve to show that they are not fitted for cruising, or even specially adapted for ordinary sailing. The term "tuckup" is applied in a general sense by the boat builders about Philadelphia to a method of building, in which the keel, instead of being straight or nearly so for the whole length of the boat, with deadwood on top of it and the garboard laid in a rabbet cut in the latter, is bent up precisely as in the boat here shown and the sneakboxes and cruisers previously described in our columns. After the boat is completed a sternpost and scag are fastened on. This method of building is used in the hundreds of small sailing boats that are found on the Delaware River about Philadelphia, and to which the name "tuckup" is also applied. The favorite size now is 15ft. long, with a limit of 4ft. 7in. beam, and a depth of about 18in. midships, with 9in. sheer forward and 6in. aft. The boats are used mostly for racing, carrying a rig which they will not stand up under when afloat and with no one on board. No ballast is used, but the crew of five all hang or "hike" out to windward. In racing if the wind drops one or more of the crew are ordered overboard, to swim ashore, the boat proceeding with the lessened amount of ballast and taking the chances of an increase in the wind. The boats are all cat-rigged and with square dagger boards. It will be seen that they are little adapted for cruising or for any purpose but racing.

The boat shown in the accompanying plans, the Delta, was planned by Dr. H. G. Piffard, former owner of the sneakbox Bojum, illustrated in the FOREST AND STREAM of Jan. 8, 1885, and is an attempt to combine the best qualities of several boats. The bottom of the sneakbox is preserved, but with the bows of the ordinary rowboat, as well as a higher side, while the overhang and rudder of the sharpie are added. The boat was intended for pleasure sailing about Gravesend Bay, Conn., to carry half a dozen comfortably, and yet to be easily handled by one. While a fair amount of speed was looked for, the boat was not intended for racing, and if wanted for such a purpose, to carry all the sail the model is capable of with a crew on the gunwale, a heavier construction would be advisable. For all ordinary work the boat has proved amply strong, and the construction here given can be followed in all details.

The question has often been asked, "Why not put a boat bow on a sneakbox?" and for all save hunting purposes there seems no reason why it should not be done, in fact this boat is a practical answer to the question. The Delta was built in the spring of 1886, and has thus been in use two seasons, giving perfect satisfaction. In order to meet the wants of the single hand cruisers the drawing is given with two scales, by which a boat of 13ft. extreme length may be built, as well as the original length of 18ft. The former should make a remarkably good little craft, larger, faster, abler and far handsomer than the sneakbox, and little more costly. The bow is not so well adapted for beaching, and the boat is too large and high to serve as a blind or shooting battery, as a sneakbox often does, but as far as sailing and general cruising are concerned the odds are all in favor of the Delta as compared with any form of "box." The dimensions of the two sizes are:

	18FT. BOAT.	13FT. BOAT.
Length over all	18ft.	13ft.
L.w.l.	16ft.	11ft. 8½in.
Beam, extreme	5ft. 4 in.	3ft. 10¼in.

Those not familiar with the tables will find their use fully described in "Canoe and Boat Building for Amateurs," page 22. The tables are carefully prepared to the outside of the planking, but the lines should be laid down full size on a floor, as described in "Canoe and Boat Building for Amateurs," and accurately faired before the moulds are made. Small errors are apt to creep in which are greatly magnified in working from a small to a large scale, and these are best rectified in a full-sized drawing before proceeding to the woodwork. The fractions given in the tables, as previously explained, are all eighths of an inch; thus, 1 3⁰ signifies one foot three inches and six-eighths, or three-quarter, inch.

The scantling for the larger boat will be: Keel of oak, ⅞in. thick and 5in. wide; stem of hackmatack or oak knee, sided 2in.; sternpost, oak, 1×2in.; scag, yellow pine, 1in. thick; planking, cedar, ⅝in., the garboard ¾in.; deck, cedar or white pine, ½in. scant; coaming, oak, ⅝in.; deck beams, 1¼×1¼; ribs, 1×½in., spaced 9in. A clamp, 2×⅝in. at middle, tapering to 1⅛×⅝in. at ends, will be run inside from the bow to the bulkhead, being riveted through the ribs and upper strake. It should be set so far below the gunwale as to allow the deck beams to rest on it. A solid chock should be fitted in place of a breast-hook at the bow, below the deck and on top of these clamps. The after bulkhead will be of 1in. pine or spruce. The well for the centerboard will have headledges *b b* of oak, 1×2in., with bed pieces, also of oak, 3½in. deep and 1¼in. thick, the sides above being of 1in. clear white pine.

The keel is ⅞in. extreme thickness, but it may be tapered beginning at station 5 and reducing it to ½in. at the after end, so that it will bend more easily. It will be thicker than the garboards, but when the planking is completed the bottom will be planed down on the edges to meet the latter.

The smaller boat will have keel ¾in. thick, stem sided 1½in., ribs ¾×⅝in. spaced 8in., planking ⅛in., deck ⅜in., coaming ⅜in. scant, deckbeams 1in. wide and 1¼in. deep, headledges 1½×⅝in., bedpieces 3×1¼in. In construction, the keel is first laid on the stocks and the stem is got out and fitted. A mould is made for every station, see "Canoe and Boat Building," that for station 8 being carefully beveled and fitted, as it is to remain permanently as a bulkhead. A mould is now made of common stuff to fit the upward curve of the keel from station 5 to the stern, and is set up on the stocks, the keel being shored down into place. The moulds, eight in number including the bulkhead, will then be set in place. Only half as many moulds would be used by a regular builder, but the amateur will find the work easier if he has plenty of moulds. The shape of the stern is got out by two pieces of tapered quarter timbers. These need be only of 1in. pine or spruce. They must be marked out from the lines on the floor and carefully beveled. They are screwed to the keel and also to the bulkhead, being let into the latter.

A number of ribbands of oak or yellow pine, with clear, straight grain are now run round the moulds, about six on each side. The ribs are now plank up, steamed, and bent into place, being held by a nail partly driven through each ribband. Each rib is long enough to lap the full width of the garboard, the two that go to make a frame lying side by side where they cross. When the ribs are all in and fastened permanently to the keel and temporarily to the ribbands, the lower ribband on each side is taken off, the garboard got out and set. The next ribband is then removed, and another plank set and so until the boat is planked. The piece *a*

is of oak, 1¼in. thick, set down on the keel to stiffen it and form a mast step. It should be put in place before the ribs go in, the latter being jogged in and well fastened to it. The clamps should be put in before the frame is taken from the stocks, the deck beams being also fitted.

The slot for the trunk should never be cut until the last thing, but when the planking is completed two mortises are cut for the headledges, the two bedpieces are got out and fastened to them with through rivets, the boat is taken from the stocks and the trunk put in, screws being driven through the keel into the bedpieces. The sides of white pine are then put on, after which the deck beams, previously fitted, will be fastened in. They should run across the trunk, being jogged down so that the deck will close the top of the trunk tightly. The mortise for the sternpost is next cut, the post put in and fastened to the bulkhead, then the scag is cut and fitted, being fastened through with screws from inside of keel. To make a tight casing for the rudderstock, a piece of pine 3½in. square, *e*, is fitted to the keel, reaching to under side of deck, being set in whiteleud and well screwed to make a watertight joint. A hole is then bored for the iron rudderstock. Ledges about 3in. deep run across the boat to carry the floorboards, and also to stiffen the bottom, for which purpose they should be well riveted through the planking. The decks are supported along the well by knees *c c c*, three or more on each side, forming lockers. One or more of these may be fitted with doors as shown. After the boat is taken from the stocks the slot for the centerboard is cut in the keel. The rudderstock is shown in detail, the shank of round iron, ⅞in. with two flat pieces each 1×¼in. welded to it, the head being squared for a tiller. The blade of the rudder is of oak, 1in. thick where it is let into the stock, but tapering to a fine edge forward and aft. On deck there should be a brass plate, while a pin through the stock prevents it from falling. A strip of iron ⅜x1¼ may be run from the centerboard slot aft to the rudder, with a pin up into the center of the latter, as shown. This will serve the double purpose of stiffening and protecting the scag and rudder, and also of preventing the fouling of the latter by weeds and lines. The deck should be covered with light drill, 6oz. laid in white paint. All fastenings should be of copper except where brass screws are used. The sizes given for planking and decks are for planed stuff and in all cases are thick enough to allow of planing off after caulking, which will always be necessary. Many details of building omitted here will be found in "Canoe and Boat Building," and also in the previous articles on sneakboxes, Jan. 5, 1885; Jan. 7, 14 and 21, 1886. The board shown is large enough for all sailing and in the smaller boat if room is an object it might be shortened by 6in. on the after end. The size of cockpit may be varied according to the use of the boat; for a large party it may run further forward on each side of the trunk, but for rough water and cruising the size shown will answer very well. The mortise for the mast step may be cut in the piece *a*. The forward deck should be strengthened by a piece ¾in. thick and 6 to 7in. wide, running from stem to trunk under the deck beams and riveted through beams and deck plank. Where the mast goes through the space between the two should be filled in solid. The sail shown in FOREST AND STREAM of July 1, 1886, is well adapted for the smaller boat and will be none too large, but we shall give some other sail plans for both sizes.

PROPOSED AMENDMENTS TO CONSTITUTION.

NEW YORK, Oct. 29.—*Editor Forest and Stream:* In the proposed new article to be inserted in the constitution of the A. C. A., there would be to my idea a path opened for the introduction and perpetuation of a class of life members, invested with an authority that would be envied by all of the members of the A. C. A. who are not fortunate enough to be ex-commodores, but who are anxious enough to serve on the executive committee when their time comes. The number of these life members would be constantly increasing, or rather would be increasing year by year, and they would greatly handicap any new member of the executive committee who would be at a great disadvantage in not having had the experience of these life members, who having exercised their power in the Association councils for so long a time, would by their pulling of the wires practically control the meeting. We know that ex-commodores are pretty good at wire pulling, of which we have had several examples, these, fortunately, turning out all right. In the above I deal perhaps in possibilities, still there is no use opening the way for anything of the sort. The ex-commodores do not seem to have lost their interest in the A. C. A. by stepping down to the level of the rank and file. Why throw a sop to them by instituting for their benefit a preferred class with more authority than have the rank and file? It would not be doing justice to the majority. At the meet at Grindstone in 1885 and 1886, there was considerable fault found by the members because of too much gold lace business affected by the officers, and I think that if this article is inserted in the Constitution it will just as surely cause dissatisfaction, because it will pave the way for something of the same sort. We are all members of the A. C. A. on a common footing and we want no preferred members with authority. We all want a chance to become members of the executive committee, and as we all stand a chance of being the future President of the United States, we in the United States each look forward to being (a bare possibility) the Commodore of the A. C. A. If more members are required on the executive committee let the number be increased by some other means, for instance, let the committee be given power to appoint from some part of the Division that has not been fortunate enough to be represented by a regularly elected member, a representative, who would have by virtue of this appointment full authority and be a regularly constituted member of the executive committee, but let this power be limited to one or two appointments. If they see fit, they can leave out the old wire pullers, they have had glory enough, but if it is thought necessary to recognize their services, do so in some other way. A vote of thanks engrossed for instance, something they can have framed and hung up, do almost anything rather than perpetuate a class of ex-officers with authority. It is too important a step to take; it would eventually result in vesting the control of the Association in the ex-commodores, or at least they would always hold the balance of power at the executive committee meetings. If we should want any of them to serve again, I think in the interests of the Association they would serve, but suppose we did not want them, what then? The Association has been growing more democratic every year, and with this growth has come success. At present all members have an equal voice in the management, and a remedy for dissatisfaction in the ballot. To restrain this privilege in the slightest degree would be a great mistake. Why then institute this class of life members or governors, who could not be reached by the ballot and against whom we would have no remedy, and who would take the place and influence in the councils of perhaps more desirable members.

I do not desire or intend to reflect in the slightest on our Commodore or any of the ex-Commodores of the Association, and I hope that nothing in the above will be so construed. I simply wish to give my ideas from my standpoint on this aristocratic (and it might turn out autocratic if inserted) article.

RANK AND FILE.

A. C. A. EASTERN DIVISION.—Vice-Com. Jones has appointed the following gentlemen on the regatta committee for 1888: Dr. H. E. Rice, Springfield, Mass.; Messrs. Nathan A. Gibbs and Maxton Holmes, Chelsea B. C., Norwich, Conn. It is proposed to hold a meet about July 1-4 on the Thames River, some five miles above the mouth. The location is favorable and may be readily reached. The Howard-Yale boat race will be held near at hand about the same date, and a canoe camp would attract many boating men, while it would give the canoeists an opportunity to witness the races. The present prosperous condition of the Eastern Division promises a large and successful meet.

RACING IN ENGLAND.—The Free Rovers C. C., of Birmingham, sailed two regattas last month, the first on Oct. 1 being only partly successful, as some of the men failed to arrive. Only one race was sailed on that day, unlimited sailing for a challenge cup and silver medal, the former won by Snowbird, H. C. Butler, with Viking, W. T. Jones, second. On Oct. 8 a paddling and sailing race was won by Iolanthe, E. S. Cooke, with Snowbird second. The handicap sailing race was stopped by a calm, but Iolanthe again won. A handicap paddling race was won by Polecat, a half mile paddle by Polecat also.

THE NEXT A. C. A. MEET.—*Editor Forest and Stream:* I think I can safely say that the New Jersey contingent of the A. C. A. prefer Lake George as the site for next year's camp. The day we cruised from Caldwell to Baldwin's on our way to Bow-Arrow will never be forgotten, but we were in a hurry, and we went too fast. And now if the executive committee will only choose Lake George and let us spend two weeks there next August, we shall be just as pleased as if we had the "meet in our back yard."—ESSEX.

OFF FOR ENGLAND.—Ex.-Com. E. B. Edwards, of Peterboro, sailed from New York on Oct. 29 for England.

Yachting.

Address all communications to the Forest and Stream Pub. Co.

AN ACT TO PREVENT YACHT RACING.

THIS deed of gift, made the twenty-fourth day of October, one thousand eight hundred and eighty-seven, between George L. Schuyler, as sole surviving owner of the Cup won by the yacht America, at Cowes, England, on the twenty-second day of August, one thousand eight hundred and fifty-one, of the second part, witnesseth:

That the said party of the first part, for and in consideration of the premises and of the performance of the conditions and agreements hereinafter set forth by the party of the second part, has granted, bargained, sold, assigned, transferred and set over, and, by these presents does grant, bargain, sell, assign, transfer and set over unto the said party of the second part, its successors and assigns, the Cup won by the schooner yacht America at Cowes, England, upon the twenty-second day of August, 1851, to have and to hold the same to the said party of the second part, his successors and assigns, in trust nevertheless for the following uses and purposes:

This Cup is donated upon the condition that it shall be preserved as a perpetual challenge cup for friendly competition between foreign countries. Any organized yacht club of a foreign country, incorporated, patented, or licensed by the Legislature, Admiralty or other executive department, having for its annual regatta an ocean water course on the sea, or on an arm of the sea, or one which combines both, shall always be entitled to the right of sailing a match for this Cup, with a yacht or vessel propelled by sails only, and constructed in the country to which the challenging club belongs, against any one yacht or vessel constructed in the country of the club holding the Cup.

The competing yachts or vessels, if of one mast, shall be not less than sixty-five feet nor more than ninety feet on the load waterline. If of more than one mast they shall be not less than eighty feet nor more than one hundred and fifteen feet on the load waterline.

The challenging club shall give ten months' notice, in writing, naming the days for the proposed races, but no race shall be sailed in the days intervening between Nov. 1 and May 1. Accompanying the ten months' notice of challenge there must be sent the name of the owner and a certificate of the name, rig and following dimensions of the challenging vessel—namely, length on load waterline, beam at load waterline and extreme beam and draught of water, which dimensions shall not be exceeded, and a Custom House registry of the vessel must also be sent as soon as possible. Vessels selected to compete for this Cup must proceed under sail on their own bottoms to the port where the contest is to take place. Centerboard or sliding keel vessels shall always be allowed to compete in any race for this Cup, and no restriction nor limitation whatever shall be placed upon the use of such centerboard or sliding keel, nor shall the centerboard or sliding keel be considered a part of the vessel for any purposes of measurement.

The club challenging for the Cup and the club holding the same may, by mutual consent, make any arrangement satisfactory to both as to the dates, courses, number of trials, rules and sailing regulations and any and all other conditions of the match, in which case also the ten months' notice may be waived.

In case the parties cannot mutually agree upon the terms of a match, then three races shall be sailed and the winner of two of such races shall be entitled to the Cup. All such races shall be on ocean courses, free from headlands, as follows: The first race, twenty nautical miles to windward and return; the second race, an equilateral triangular race of thirty-nine nautical miles, the first side of which shall be a beat to windward; the third race (if necessary) twenty nautical miles to windward and return; and one week day shall intervene between the conclusion of one race and the starting of the next race. Those ocean courses shall be practicable in all parts for vessels of 23ft. draught of water and shall be selected by the club holding the cup; and these races shall be sailed subject to its rules and sailing regulations so far as the same do not conflict with the provisions of the deed of gift, but without any time allowance whatever.

The challenged club shall not be required to name its representative vessel until at the time agreed upon for the start, but the vessel when named must compete in all the races, and each of such races must be completed within seven hours. Should the club holding the cup be for any cause dissolved the cup shall be transferred to some club of the same nationality, eligible to challenge under this deed of gift, in trust and subject to its provisions. In the event of the failure of such transfer within three months after such dissolution said cup shall revert to the preceding club holding the same and under the terms of this deed of gift. It is distinctly understood that the cup is to be the property of the club subject to the provisions of this deed, and not the property of the owner or owners of any vessel winning in a match.

No vessel which has been defeated in a match for the cup can be again selected by any club as its representative until after a contest for it by some other vessel has intervened, or until after the expiration of two years from the time of such defeat. And when a challenge from a club fulfilling all the conditions required by this instrument has been received no other challenge can be considered until the pending event has been decided.

And the said party of the second part hereby accepts the said cup subject to the said trust, terms and conditions, and hereby covenants and agrees to and with said party of the first part that it will faithfully and fully see that the foregoing conditions are fully observed and complied with by any contestant for the said cup during the holding thereof by it, and that it will assign, transfer and deliver the said cup to the foreign yacht club whose representative yacht shall have won the same in accordance with the foregoing terms and conditions, provided the said foreign club shall by instrument in writing lawfully executed enter with said party of the second part into the like covenants as are herein entered into by it, such instrument to contain a like provision for the successive assignees to enter into the same covenants with their respective assignors, and to be executed in duplicate, one to be retained by each club, and a copy thereof to be forwarded to the said party of the second part.

In witness whereof the said party of the first part has hereunto set his hand and seal, and the said party of the second part has caused its corporate seal to be affixed to these presents, and the same to be signed by its commodore and attested by it secretary the day and year first above written.

GEORGE L. SCHUYLER.

In the presence of
H. D. HAMILTON.
[Seal of N. Y. Y. C.]

THE NEW YORK YACHT CLUB,
by ELDRIDGE T. GERRY, Commodore.
JOHN B. BIRD, Secretary.

The above formidable document, adopted last week by the New York Y. C., is from a lawyer's standpoint worthy of the highest praise, a masterpiece of the art. If the object of the framers was to keep the Cup they have double reason to be proud, for it not only promises to accomplish that end most effectually, but it does it in a manner that in itself is dear to the legal heart. Compared with the brief and simple phraseology of the former deeds, the new one is lengthy and verbose, it is put in the form of a legal agreement with covenants, parties of the first and second part, successors and assigns, etc., etc., and like too many of its kind, the dull and elaborate provisions of its various clauses are robbed of all their weight by the insertion of half a dozen words that might be passed without notice on a casual reading, and yet which outbalance all the rest of the document. Seemingly fair and liberal on its face, the deed is far more strict in its demands than either of the others, and the concessions made in favor of racing demands are all nullified by a single short clause.

On comparison with the two previous deeds, published in the FOREST AND STREAM of Oct. 13, a number of changes will be found. In regard to the time necessary for a challenge the limit has been extended from six to ten months, and while this is asking a very long notice, it has this advantage, that it permits all arrangements to be made well in advance, say in November; while before, a man who sent a notice of challenge, which amounted to nothing, and then proceeded to build his boat might be forestalled by another challenge sent early in the spring. Now the challenger, if there ever is another, can send a challenge in October, and on its acceptance begin his boat in safety. The demand for a ten-months' notice, however, seems preposterous; six months has always been sufficient, and certainly should be in the future. As it is now, no challenge can be sent after Dec. 1 for the ensuing year. A challenger should be allowed to send his challenge by Nov. 1, and to arrange all conditions then; while, at the same time, if no one challenges then, the opportunity should be left open until March. One point that has been established for the first time is, that but one challenge can be entertained at any time, which certainly seems a fair provision. A minor point to be noticed before proceeding to the vital ones is, that any club winning the Cup must enter into a legal agreement with the present holders to carry out all the provisions of "this act."

A point formerly in dispute, the question of dimension vs. tonnage, has been settled by a demand for the loadline length and beam, the extreme beam, and the draft, all of which it is provided shall not be exceeded. This is far better than any tonnage business; but it is laying down a good deal to say that the beam and draft shall not be exceeded. The designer will allow sufficient on the length to allow of more ballast if it be found necessary, without exceeding the given limit of length, but he cannot be prohibited from altering the trim, and consequently the beam and draft of his vessel as long as the loadline is within the limits. This clause will allow the defending yacht to alter her ballast as she pleases as long as her waterline is under length; but if it be strictly enforced, the challenger will be allowed no variation from designed trim. If it was intended to leave a certain margin for the designer it should be so stated; as it now reads he must give the correct dimensions of the proposed boat when afloat in racing trim, and these must not be departed from.

Puritan was sailed well below her designed draft, Mayflower not only went below her draft but a 6in. shoe was added below the keel, and such changes must be permitted in every boat. The defender may change his craft at will, more or less ballast, deeper or shoaler keel, but the challenger is bound down strictly to certain fixed dimensions, and can only depart from them at his peril. If the draft be given at 13ft. and after trial extra keel be added, as in Genesta's case, the boat may be technically disqualified on arrival here, or the same may be done should her greater or less draft make a change in the beam at waterline. But this is not the worst; the challenger is compelled to give virtually the form of his yacht. Given the waterline, draft, and the beam at two points, the general character of the design is made sufficiently plain to any naval architect. On the other hand the defender is unknown until the morning of the first race. In other words the club demands that its opponent should show its hand fully, while nothing is conceded in return, or to make a comparison, that the prosecution must disclose its case, while the defense conceals its side entirely. Nothing could be more contrary to the spirit which should govern all such competitions. What the club has a right to ask is the waterline length and the correct measurement as nearly as may be by the rule under which the races will be sailed, while at the same time restrictions on sail area, of sail area, trim and draft, as long as the waterline is not exceeded, should be permitted to the defender and yet forbidden to the challenger.

The provision that centerboards shall not be penalized is hardly necessary now that there is no likelihood of the Cup ever going out of the possession of the New York Y. C., but in view of the Mayflower-Arrow controversy it might have been necessary had the Cup ever gone abroad.

It may be inferred from the wording of the seventh clause that the great point which the FOREST AND STREAM has advocated for years has at last been conceded by the club, and the Cup races, if there ever are any more, will be sailed in open waters and over no mouse-trap courses; but it must be remembered that it is still within the power of the New York Y. C. to insist on a race over the old inside course, and a very powerful instrument for enforcing that or any other extravagant demand is provided.

This point has been generally praised by the papers in commenting on the changes, but really there is nothing more in the new deed to prohibit the selection of the old course than in either of the others; and it rests only with the whim of a regatta or Cup committee at any time in the future to demand that a challenger shall sail the inside course or else meet a 90ft. yacht without time allowance. While the specification of outside courses leads to the inference that they should be selected as a matter of course, it is evident that they were laid down, not to prohibit the New York course, but in the event of the Cup going abroad to prevent the selection of courses, such as that around the Isle of Weight, which would not be suitable for centerboard boats. There is really no guarantee that the next challenger may not be offered the same courses as Thistle and Galatea, and on refusal he must face the alternative of no time allowance.

The minimum depth of water, enough for a yacht of 22ft. draft, is of course laid down for the benefit of the centerboard, but the keel men are little likely to quarrel with it. The time limit of 7 hours for a 40 mile race is insisted on, a very good provision for all.

The vital point of the whole deed is the seventh clause, as it really contains all the important conditions. No matter what may be mutually agreed upon, the real limits are those laid down in case of a failure of the negotiations, the terms which a challenger may be forced to sail under if he disagrees with the temporary committee on any point. As it now stands, in the case that the conduct of the races of late years has been fair and that it is likely to be so in the future. Whether or no this be true the club is provided with a powerful and convenient lever for forcing any conditions which it pleases on a challenger, and it is this power which will dictate the class of yacht which shall be built for the Cup races. Any challenger coming here for the Cup must first consider the possibility of having to meet a yacht of 90ft. waterline length rule and with no tax on sail area, and he must build to beat her. It is true that he may be matched by a very different vessel, but at the same time he would not be justified in taking such chances, and practically he is firmly bound to build such a boat, a 90ft. singlesticker or a schooner yawl of 115ft., to race on length only. If a sloop, he may be put at a disadvantage in a match under the prevailing rule of the club, by which sail area is reasonably sure to be taxed to a certain extent, and he may be compelled to give an allowance for rig to a really better vessel. If, on the contrary, he builds to meet the club rule with a tax, however small, on sail area, he may be finally compelled to accept the alternative provided, of a race without time allowance against a boat built under a length rule. It is possible that races might be sailed for years without a recourse to this clause, and yet it may arise at any time, and every intending challenger must of necessity take it and not the racing rule of the holder as his guide in building. The objection which we have long made to the New York rule, that it taxes sail too little, is becoming more generally recognized each year, and there is a remote prospect that the rule may some day be changed, but here is seen the curious matter of a club setting up two rules in direct opposition, the one taxing sail area, and the other, for its most important contests, offering a direct premium on sail.

What yachts would be built to meet a coming challenger? Volunteer and the others are all disposed of, as they are too small, and it will be necessary to look to a new fleet of 90-footers, certainly a very large size of yacht. The defender is not required to name his boat until the morning of the first race, so the boats to be built in advance would be first a "footer" of 90ft. loadline, with any amount of sail her designer cares to risk. The ordinary weather off Sandy Hook is nothing formidable for a yacht of 90ft., and a big machine would be perfectly at home there, as much as many 35ft. boats in the Bay or the Sound. What would be the best for this work is not important at present, whether a big skimming dish with unlimited sail or an equally exaggerated Pappoose, with a similar spread. Given a certain length; beam and draft without limit could be made to carry an enormous driving power to advantage, and the boat which was compelled to make an ocean voyage would not have a ghost of a chance. If on the other hand the preliminary details should be agreed on without dispute, the races would naturally be sailed under the rules of the New York Y. C., and a different yacht in model and rig would be needed, a boat that would be as powerful as possible without too great sail spread. It is possible under the fourth clause that a match might be arranged and successfully sailed between yachts of 65ft., but in practice the challenger must come prepared to meet a boat of 90ft. designed under a length rule, while the defender must have such a boat in reserve in case it may be needed.

It is likely now the present state of affairs will prove a bar to further challenges for an indefinite time, and in the meanwhile does any one suppose that there will be any development of the new 90ft. class? The fate of the present large boats is still in doubt, there is likely to be little racing against Volunteer next year, and it seems probable that the class will at least stand still. Then if a challenge is received in the future, the work of building up the new class must be commenced anew. No steady development, no racing every year at home, no general interest in the class, but it is to be something special and apart, dedicated to Cup races which are never to take place. No one can say that this class, even if kept up, is a benefit to yachting, while the second class is ignored and left to shift for itself. As far as the Cup races are concerned the second class is out of the fight, and the good that might have accrued through a strong competition in this class is entirely lost. We have dealt only with singlestickers, but the case is fully as bad with schooners. At present there are just four schooners of 115ft. l.w.l. and over, Dreadnaught, Dauntless, Coronet and Ambassadress, and there are but six between 100 and 115ft. What about Fortuna, Montauk, Sachem, Grayling, Gitana, the yachts which do the racing; are they worth no consideration, and to be ignored entirely by the club. A racing schooner of 115ft. is a most undesirable possession, and it is unlikely that such a class will ever be seen, but this bugbear is put in the way of any man who should ever wish to challenge with a schooner of ordinary size, who should wish, for instance, to build to meet Sachem for the Cup. Why the fourth clause was ever inserted it is difficult to see, unless the idea was to foster the delusion that the New York Y. C. offers a fair match to any size of yacht within the limits named. A challenger who built on this supposition might very possibly find it realized, but he would take a very great risk in trusting to it, in view of the present action of the club in adopting without protest or objection, all the provisions of the seventh clause.

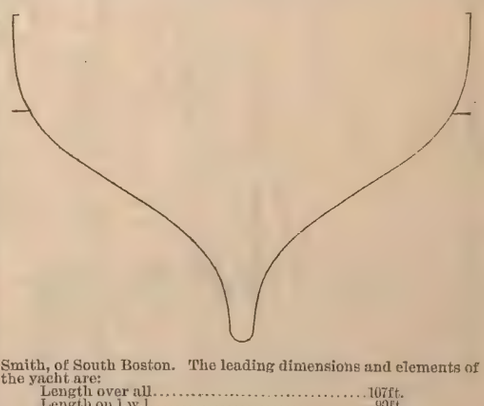
All the legal verbiage concerning the parties of the first and second part amounts to nothing when it is considered that the real party of the second part is the great body of outside clubs from whom challenges must come. The dealings of the committee and donor are of comparatively little importance; what is of vital interest is the relation between the New York Y. C. and the yachting world which is established by the deed of gift, and yet the rights of the latter are in no way regarded. The challenger must give all and get nothing in return; he must specify closely the yacht he proposes to bring, and he must not depart from that specification, while he will not know until the day of the first race what yacht he is to meet, the latter being allowed every liberty in the way of alteration.

The club has set up the standard of size, not of quality, and in doing this it has repudiated directly its present rule and set up another. It has been urged in excuse that the intention was to shut out catboats, to confine the competition to yachts of suitable size, but the practical result has been to return to the old rule of length under which catboats and sandbaggers were built and flourished. Each side in the future must face the possibility of having to build the most powerful boat possible on a length of 90ft., without limit on depth, sail spread or any dimensions but plain length. What sort of machine will be the outcome of any possible racing under this rule it is hard to foretell, but it is safe to say that such a boat, if built, will combine the maximum of expense with a minimum of all good qualities except speed.

A small enough limit is already provided; the old deed calls for 30 tons, a boat not under 55ft. l.w.l., and further, it would be dangerous to cross the Atlantic in a smaller racing boat than this. As for real racing, apart from size, the standard of excellence is certain to be far higher in a class like the second or third, where there are from six to a dozen boats constantly racing, with additions each year, than in a special class kept up only by spasmodic effort, as is sure to be the case with the proposed 90ft. class.

It is a grave question whether the club at this date has any right to make such a radical alteration in the letter and spirit of the original deed as it has done in this case. It is specially provided that the competition shall be open to all yachts of 30 to 300 tons, or to translate it into modern terms, from a minimum limit of about 55, upward The present action, as we have shown, is really to limit the competition to two special classes, 90 and 115ft., something never contemplated by the original deed. No one is likely to contest the legality of this action, but it is very doubtful whether any court would sustain the position of the club.

Faulty as the matter of the deed is, the manner in which the changes have been made are no less open to criticism. The clause as to the limit of 65 to 90ft. is a mere subterfuge, and the wording as to the course is equally doubtful. It would have been far better to have come out at once with a fixed limit of 90ft., rather than to apparently give something in one clause which is withdrawn by the next; and in the same way, the selection of the inside course could better have been directly prohibited, rather than left open as now. The manner in which the deed was brought before the club is open to the gravest criticism. The deed was prepared and finally accepted prior to the meeting; when reached in the order of business it was hurriedly read through once. A member who arose and asked whether the deed was open for discussion was informed by the chair that such was not the case, that all had been settled, and then nothing was left but a formal resolution of acceptance. Such methods may do for Albany or a local board of aldermen, but they can only disgrace any yacht club which countenances them. No opportunity for discusssion, nor even for a negative vote by the body of the members, a matter cooked in committee and given to the club to bolt with its eyes shut.



The action of the club in this matter must be taken as a final expression of its view of the trust imposed as guardians of the Cup, not to encourage fair contests in the interest of yacht racing, but rather to keep the Cup in possession of the club by such means as seem best fitting to that end, and in this it is likely to succeed most thoroughly.

It is needless to say that Mr. Sweet's challenge is off, but whether another will follow is as yet uncertain. No one who fully understands the present conditions is likely to risk so much for the small chance of return. It may be that some Quixotic Briton, with more valor than discretion, will rush hastily in with a challenge; but one such attempt is likely to prove enough. Certainly if he should venture across with a yacht under the maximum he will take a very great risk.

The present year is likely to be a notable one in the Cup annals, for the Cup has been saved twice; once by the skill and fair sailing of General Paine and once by the quasi legal action of the holders, which has locked up so safely that there is little chance of a future challenge and still less of a race under equal conditions.

SPEEDWELL.

THE accompanying diagram represents the midship section of Mr. Henry Bryant's new cruising schooner, now building by

Smith, of South Boston. The leading dimensions and elements of the yacht are:

Length over all	107ft.
Length on l.w.l.	90ft.
Beam, extreme	23ft. 3in.
Beam, l.w.l.	21ft. 10in.
Draft	13ft.
Least freeboard	3ft. 11in.
Overhang forward	1ft.
Length of fore body	51ft.
Length of after body	39ft.
Area of midship section	197sq. ft.
C.B. from stem	49.88 ft.
C.B. below l.w.l.	2.98 ft.
C.L.R. aft of stem	51
Ballast, short tons	56
Keel, 42ft. long, short tons	35
Area lower sails	6,030sq. ft.
Bowsprit, outboard	30ft.
Main mast, deck to hounds	63ft.
Main boom	63ft.
Main gaff	37ft.
Maintopmast	31ft.
Foremast, deck to hounds	58ft.
Foretopmast	28ft.
Mastheads	9ft.
Foremast from stem	24ft. 11in.
Mainmast from stem	36ft. 3½in.

The bowsprit will be a round spar, with no jibboom.

PROBABLY THE FIRST CENTERBOARD.—*Editor Forest and Stream:* John and Townsend Stites, brothers, were born and lived all their lives at Beesley's Point, Great Egg Harbor, New Jersey. John Stites died about 1865, aged 81, and Townsend a few years later. They both told me that when they were boys all their boats carried lee boards, but that a colored man whose name they gave me, and which I have forgotten, put a centerboard in his skiff, and it was the first one that they had ever seen and heard of, and that its superiority to the old lee board was so manifest that they all adopted them. This is a simple statement of what the Messrs. Stites both told me. Their descendants still live at Beesley's Point.—C. R. MOORE (Bird's Nest P. O., Virginia, Oct. 26).

RESTLESS.—Col. Singerly's steam yacht, built this year, will be cut in two and lengthened during the winter by her builders, Houston & Woodbridge. She will have a second steel boiler and a new Trout wheel.

THE STEAM LAUNCH EXPLOSION.

As the owner of the little steam launch which exploded on Sunday week is still in the hospital with two of his companions, no inquest has yet been held over the killing of the two Cunningham brothers. According to the story of Carl Schmidtke, the owner, the boat was a new one but the engine was old, though retubed for him and tested in the shop to 160lbs. The boat had never been inspected, and it is claimed that she was just completed and had never been run, and that application was to have been made at once for a license. As to this story, there are hundreds of small launches about New York which are never inspected or licensed, and whose owners are never called to account by the authorities. If one is caught by accident he has the same story ready—just about to apply for an inspection; so he is let off with a reprimand. Wherever there is a lake or river throughout the country others of the same sort are found, most of them uninspected and run by unlicensed and incompetent engineers.

The man who has a good boiler and knows how to run it has little fear of inspection, but the craft we speak of are largely cobbled up from the junk yard and scrap heap, anything which will make steam being good enough. This class of boat demands a most rigid inspection, but it is a difficult matter, owing to the large territory embraced in the various districts and to the small force of inspectors in many cases. The leniency generally shown also tends to make the matter worse, as there is little fear of the law among owners. It is on account of these difficulties that the law should be enforced to its fullest extent when a case can be fully proved. The penalty is very heavy, from $100 to $500, and if it were strictly enforced in only two or three instances in any locality it would bring all the owners in the vicinity to terms. The attention of the inspectors is generally directed to the larger vessels and where there is a pressure of business the small fry are apt to be left unnoticed except when some occurrence like the present calls attention to it. The necessity for a thorough supervision and inspection exists, however, and it rests with the inspectors and their chiefs to see that these boats receive the attention they deserve. A trip about New York and up some of the creeks and docks about the suburbs in a swift launch would reveal many a small launch entirely unfit for use whose existence is unknown to any but the few interested in her. The law as it is enforced is a fair and just one, and there can be no excuse for the owner of a properly equipped craft. It is only the second-hand rattle traps that really fear to pass an inspection that would certainly condemn them.

CLARA AND CINDERELLA.

Editor Forest and Stream:

In your last issue your correspondent "X.," by implication, seems to assert that the Clara and Cinderella met this season, and that the latter was within 2 minutes of the former. This is an injustice to Cinderella. The race alluded to was sailed at the end of last season, and was lost by Cinderella on account of a shift of wind which broke her off on the wrong side of a buoy, necessitating a short tack. At the time this was made Cinderella had closed up Clara's lead and had the race, which was nearly over, in hand. This season the two boats have not met, as Clara's owner concluded that his ship was not right and refused to sail, in which course he was probably right, as Clara was certainly off, and Cinderella is from 5 to 10 minutes better than she was before the extra 4 tons of lead were put on her keel. Then, too, last season Cinderella was very badly sailed and lucked, while this year she has been sailed to perfection by the old Orivia crew, headed by Mr. Bryan Alley. Clara is a very fast boat of her type, but no man who saw Cinderella lay out Hildegarde last summer at Larchmont on the 4th of July, in the beat from Captain's Island to Execution west buoy, Hildegarde being nearly 10ft. the longer vessel, would doubt that she likewise is a goer of much merit. With equal handling, and in any weather but the lightest, Cinderella would carry my money, and this without prejudice for or against either boat.

In very light airs I believe the extreme cutter to be the fastest boat ever built, but when laid over they have not, at the same angle, the side resistance of the centerboard. I would much like to see a centerboard put in the Thistle, the trunk coming to the cabin floors. Thistle's shape is very perfect, as shown by her down wind speed, but she manifestly lacks side resistance when heeled. I do not see any objection to a compromise ship such as would be made by centerboarding Thistle. She would seldom use the center fin, but it would be ready, and like Jim Bowie's pistol, she might not need it but if she did it would be very handy. M.

NEW YORK, Oct. 31.

[Clara and Cinderella met once this year, the former losing her bowsprit and giving up, but Cinderella had beaten her fairly up to the time of Clara's mishap.]

NEW YORK Y. C. MEETING.—The fifth meeting of the year was held by the New York Y. C. on Oct. 27, with Com. Gerry in the chair. It was moved and carried that the club subscription to the Burgess fund be increased from $500 to $1,000. After the treasurer's report the America's Cup committee presented a full report of the late races, copies of which were ordered printed after the report had been accepted with thanks. The revised deed of gift was then read and offered for adoption. No opportunity for discussion was allowed, the matter having already been finally arranged between Mr. Schuyler and the committee. No alternative was left to the members but a formal and nominal recognition of the action of the committee, which was passed in the following form: "*Resolved*, That the deed of gift of the America's Cup be entered at length upon the minutes of this club; that the secretary be requested to furnish to all foreign yacht clubs a copy thereof; that the club accept the cup won by the schooner yacht America upon the terms and conditions stated in the deed of gift executed and delivered by George L. Schuyler, as surviving owner thereof, to it, bearing date October 25, 1887, and hereby ratify and confirm the acts of the Commodore and Secretary of this club in joining in the execution and acceptance of said deed of gift." Mr. Sweet's resignation as a member was next taken up and not accepted, on the ground that his challenge for the Cupdid not unfit him for membership in the club holding it; a general motion to this effect being passed. As the challenge from the Royal Clyde Y. C. in behalf of Mr. Sweet, lately received, was for a boat not yet built, and as it is not in accordance with the deed of gift, it was not accepted, but a copy of the new deed of gift was ordered sent to the proposed challengers in order that they could challenge in accordance with its provisions. Forty new members were elected.

"THE NAUTICAL MAGAZINE."—*Editor Forest and Stream:* It was probably a typographical error which made you quote the notice of "Steam Yachts and Launches" last week from the London Nautical Gazette instead of the *Nautical Magazine*, an old established and well-known publication which deserves a wide circulation among American yachtsmen. It is an excellent authority and always full of interesting matter concerning nautical topics of the day.—OLD SALT.

LAUNCH OF THE CARRIE E. PHILLIPS.—On Oct. 29, the new Burgess fisherman was launched at Story's yard in Essex, going off handsomely in the presence of a large number of spectators. A chain parted as she neared the water and listed her to starboard, but she righted. When afloat there was not tide enough to allow her to leave for Boston as she drew 10ft. and the Essex River has many shoal spots. She will be fitted out at once and may be ready by Saturday. Like all of Mr. Burgess's boats she is painted white. She will carry ten dories with two men each, besides her captain, Maurice Powers, a cook and an extra man, making 23 men on board.

NEW CUTTERS.—Besides the 40ft. cutter for Kingston, and the 43ft. cutter for Hamilton, Ont., Mr. Kunhardt has just sent complete plans and specifications for a fine little cruiser 23x5½ft. to Buffalo. She is to be built at once. Her draft is 4ft. 6in., and with 22in. freeboard, gives 5ft. 3in. height under hatches. She will have 3,000lbs. iron on keel and 375 sq. ft. in lower sail. The rig is that of a pole mast cutter. The deck is flush with skylight over cabin, a forecastle hatch and one over the sail room.

NEW YACHTS.—Mr. Burgess has in hand a design for an 80ft. l.w.l. schooner of the Sachem type, with clipper stem, for a New York yachtsman. Lawley & Sons will build her. They will also build a singlesticker of 40ft. l.w.l. for Mr. James Means, and one of 29½ft. l.w.l. for New York.

GRAYLING has received part of her lead keel, increasing her draft 25in., and her sides have been scraped preparatory to a coat of white paint. The main boom and gaff will be replaced by longer ones, and she will swing a larger mainsail.

YACHTS FOR SALE.—We have particulars of a steam yacht of 529 tons, 176ft.×20ft. for sale, a cruising vessel; and also a cruising yawl of about 80ft. l.w.l. and 18ft. 6in. beam, similar to Cythera, for sale at a low figure.

EUREKA.—This wonderful gas and air motor, which has never been run since first built two years since, is now being fitted with triple expansion engines. The gas propulsion proved a complete failure.

THISTLE.—On Nov. 1 Thistle arrived at Greenock after a run of eighteen days. Her best day's run was 285 miles, the worst 75.

DAISY.—This launch, formerly the Henrietta, has been sold by Howard Jaffray to Allen Thorndike Rice.

NORMA.—The Fish engine now in this yacht will be replaced by a triple expansion at Bath, Me.

GALATEA.—On Oct. 29 Galatea arrived at Queenstown after a passage of eighteen days.

Answers to Correspondents.

MICHIGAN WANDERER.—The orders for the soldiers in the Park and the rules and regulations are as follows. We presume you can obtain a copy by applying to the Interior Department.

CAMP SHERIDAN, Wyoming, June 2, 1887.

ORDERS No. 37.]

1. Orders No. 5, dated Camp Sheridan, Wyo., Aug. 21, 1886, is hereby revoked.

2. The enlisted men of this command, when on duty within the limits of the Yellowstone National Park, are charged with its protection, and will under all circumstances enforce a strict compliance with the established rules and regulations.

The soldiers occupying the detached stations for the protection of the Park will not only enforce the rules and regulations, but will exert themselves to discover and prevent the spread of forest fires, to protect visitors to the Park from any abuse or extortion by stage drivers or other persons, and generally to preserve respect for law and order.

In the enforcement of the regulations of the Park and the foregoing instructions, soldiers will conduct themselves in a courteous and polite but firm and decided manner.

They will not hesitate to make arrests when necessary, reporting without delay to the commanding officer by telephone or otherwise.

By order of Captain Harris. GEO. W. GOODE,
Second Lieutenant First Cavalry, Post Adjutant.

RULES AND REGULATIONS OF THE YELLOWSTONE NATIONAL PARK.

DEPARTMENT OF THE INTERIOR,
WASHINGTON, April 4, 1887.

(1) It is forbidden to remove or injure the sediments or incrustations around the geysers, hot springs, or steam vents; or to deface the same by written inscription or otherwise; or to throw any substance into the springs or geyser vents; or to injure or disturb, in any manner, any of the mineral deposits, natural curiosities, or wonders within the Park.

(2) It is forbidden to ride or drive upon any of the geyser or hot spring formations or to turn loose stock to graze in their vicinity.

(3) It is forbidden to cut or injure any growing timber. Camping parties will be allowed to use dead or fallen timber for fuel.

(4) Fires shall be lighted only when necessary and completely extinguished when not longer required. The utmost care should be exercised at all times to avoid setting fire to the timber and grass.

(5) Hunting, capturing, injuring or killing any bird or animal within the Park is prohibited. The outfits of persons found hunting or in possession of game killed in the Park will be subject to seizure and confiscation.

(6) Fishing with nets, seines, traps, or by the use of drugs or explosives, or in any other way than with hook and line, is prohibited. Fishing for purposes of merchandise or profit is forbidden by law.

(7) No person shall be permitted to reside permanently or to engage in any business in the Park without permission, in writing, from the Department of the Interior. The Superintendent may grant authority to competent persons to act as guides and revoke the same in his discretion.

(8) No drinking saloon or barroom will be permitted within the limits of the Park.

(9) Private notices or advertisments shall not be posted or displayed within the Park, except such as may be necessary for the convenience and guidance of the public upon buildings on leased ground.

(10) Persons who render themselves obnoxious by disorderly conduct or bad behavior, or who violate any of the foregoing rules will be summarily removed from the Park under authority of the statute setting apart the Park "as a pleasuring ground for the people," and providing that it "shall be under the exclusive control of the Secretary of the Interior, whose duty it shall be to make and publish such rules and regulations as he shall deem necessary or proper," and who "generally shall be authorized to take all such measures as shall be necessary or proper to fully carry out the object and purposes of this act."

L. Q. C. LAMAR, Secretary of the Interior.

H. B. S., Williamsburg, Va.—The jib should sit flat if properly cut, but the luff rope must be heavier than if set on a stay, and the mast must also be well stayed.

M. H., Philadelphia.—Please put me in communication with the best people near here supplying peat moss? Ans. Write to Mr. G. I. Herbert, 21 Broadway, New York.

H. E. W.—The subject of times of flight of shot was very extensively treated in the FOREST AND STREAM a few years ago. We will reprint the conclusions next week.

J. M.—1. Use vaseline, or finest grade of machine oil. 2. The powder will compare favorably with other brand; its absolute superiority or inferiority is hard to be determined.

C. E. L.—I have purchased the mastiff bitch Boss Bess (A.K.R. 3372). Please give her pedigree, age, etc. Do you consider her fashionably bred? Ans. By Boss (A.K.R. 2218) out of Bess (A.K.R. 2217), whelped Dec. 22, 1885.

W. R. S.—The design would probably cost $150, including full details and specifications. "Small Yachts," by C. P. Kunhardt, is the best book on the designing and building of all craft under 45ft. Pappoose is 36ft. l. w. l., 13ft. 6in. extreme beam, and 7ft. 3in. draft.

SKOWHEGAN.—1. The wild rice will not hurt the bass. 2. For mode of planting wild rice see late numbers of this paper. 3. We do not know where you can get an ice boat ready made. Write to Capt. P. C. Rogers, Hyde Park, N. Y., and he may put you on the track of one.

MAN AND OTHER ANIMALS.

A brand of blasting powder is marked "f f," and the marking probably has the same meaning as in music—very loud.

There are more bears in Fulton county this fall than there have been in any season for 20 years back. Three large black ones have been killed there this month.—*Albany Journal.*

The counties where wild animals do most abound are mad with the State Controller because he refuses to accept the scalps of foxes and wildcats in payment of taxes.—*Memphis Avalanche.*

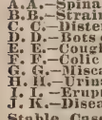
A Danbury man lost his dog. After he had given up all hope of finding the animal it came home wearing a collar marked: "Whosoever finds this dog will return him to the Rev. — —."

Some poor men thrive in Florida. Four years ago James Brown went into Polk county with only $2 and a large family. Now he has a good farm and comfortable home, and in the meantime has made $1,500 by killing 370 deer and 4 bears.

The will of the late Spencer F. Baird, of the Smithsonian Institution, bequeaths all his property to his widow during her life, and then to his daughter during her lifetime. Should both die without heirs what remains is to revert to the Smithsonion Institution.

A hunting exhibition has been opened at St. Petersburg, in the Michael Riding School. It consists of a collection of weapons and appliances used in the chase, horses and dogs, and an ornithological section. It has been organized by the Society of Huntsmen and Falconers with the assistance of several English exhibitors.

As A. P. Foss, the head machinist in the Webster and Pembroke Mills repair shop, was cleaning the leaves from the gate in the Webster Canal he saw a live chicken floating down. He reached down with a rake and pulled it up, and lo and behold there was a pickerel on the chicken's leg, and it had got such a hold that it couldn't let go, and Mr. Foss pulled the chicken and fish both to land. The pickerel weighed 2lbs. 7oz.—*Suncook (N. H.) Journal.*



A Mrs. Smith, the wife of a farmer who resides near Sunbury, Pa., went to the house of John P. Haas, a neighbor, some months ago, to sell some butter, and while in the front yard a dog belonging to Haas jumped at her and bit her in the arm. The bite was not a severe one, and soon healed up. Mrs. Smith, however, brought suit in the Court of Common Pleas, and the jury rendered a verdict in her favor for $400 damages against the Haas estate, Haas having died since the suit was brought.

A few evenings ago a flock of partridges which had been feeding on the marshes opposite Lyon's Creek Landing, where the Patuxent is about a hundred yards wide, wishing to seek their roosting grounds on this side, deliberately walked into the water and swam across instead of flying. Our informant, believing they had changed their nature and became water fowl, did not deem it a violation of the "partridge law" to secure a few birds as they emerged from the water. He succeeded in capturing six, which he enjoyed for breakfast next morning.—*Calvert (Md.) Gazette.*

Probably never before in any part of the country where game so little abounds has there been a shot fired with the same effect, under similar circumstances, as the one which Andy Dixon, of Glascock county, made a few days ago. Dixon killed four squirrels at one shot and wounded a fifth. The squirrels were out on the limbs of a tree, and not in a nest or hollow. A negro named Warren Davis a day or two ago killed four squirrels at one shot. Three of them were young ones, and they were trying to take a hickory nut from the mouth of an old "frisky tail." In these days when a hunter kills even one squirrel at a shot it is counted a good many.—*Savannah News.*

Pheasants are coming into market in great numbers. One boy of fifteen years, who lives down on Union Ridge, near Lake River, W. T., has sent enough to McGuire & Co. within the past four weeks to amount to over $90, and he has shot them all himself. The hunter out about Grant's Pass, who has sent so many scores of deer to this market this season, finding that the fore-quarters did not meet with ready sale, has taken to shooting the hind-quarters only. Yesterday he sent in ten of the latter ends. It is no trick at all to shoot a deer in the country, as City Surveyor Paget went out to the Sandy on Sunday and killed one. The hind-quarters of a remarkably fat bear were exhibited at Malarkey's yesterday and were admired by all lovers of "bar's" meat.—*Portland Oregonian, Oct. 11.*

The Fluttering Fly.
PATENTED MAY 4, 1886.

THE FLUTTERING FLY. Patented May 4th, 1886.

With the exception of our Patent Compensating Reels and Section Bamboo Rods which we introduce to the public, this fly, invented by Mr. Wakeman Holberton, is unquestionably the greatest and most radical improvement in fishing tackle ever made. The chief points of manifest superiority of this method of tying flies over the old-fashioned way are:

1st—The wonderfully life-like and fluttering motion this fly has when moved on the water.

2d—The fish is almost certain to be hooked if it touches the fly.

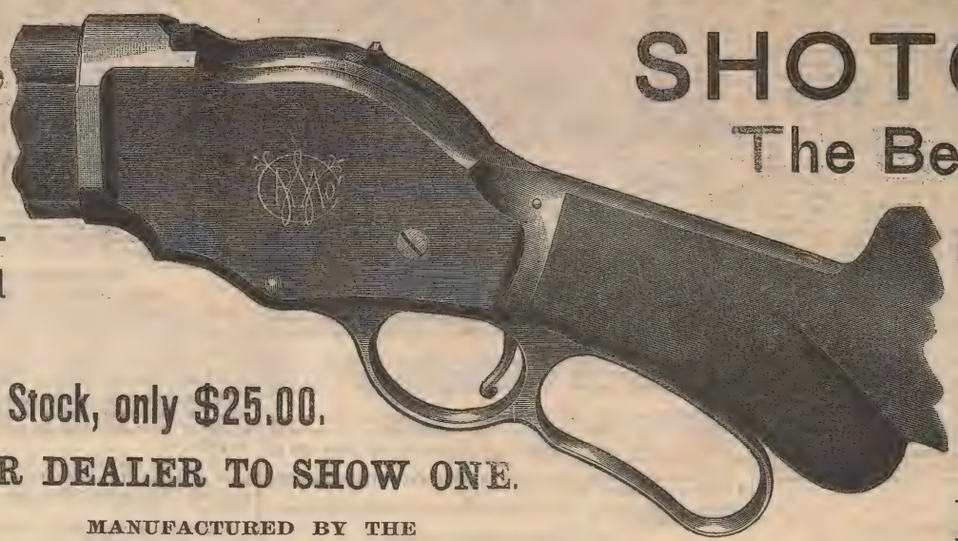
3d—Any of the present favorite combinations of color and form can be tied in this way. Thus, those who believe that fish are attracted by particular colors or forms of fly, can have their old patterns in the patent style.

4th—These flies not only offer less resistance to the wind in casting, but more resistance to the water in drawing. Hence one can do as good work with a small hook tied this way as a large hook tied as before. Experience proves that flies dressed this way can be tied on hooks two sizes smaller than one would use on old-fashioned flies.

We take this means of notifying dealers and fly-tyers that we shall prosecute any infringement of our rights under this patent to the fullest extent of the law. Our course, in regard to the protection of our patents and copyrights, is known to some people. We assure such people that the same old course will be pursued by this firm.

We add a few extracts selected from the numerous and unanimously complimentary press notices of this fly. We could add many letters from well-known and expert anglers if we were willing to drag the names of private gentlemen into our advertisements.

Scientific American: "When so arranged the wings offer less resistance to the air in casting. As the fly is slowly drawn toward the angler the wings expand, and give it a fluttering, life-like motion, much more alluring to the fish."



Forest and Stream: " * * * more like a natural insect than the old patterns whose wings close when being drawn through the water. * * * Great merit lies in its superior hooking qualities. A fish cannot nip at the wings or tail, but swallows the hook before any part of the fly."

American Angler: "There is no question as to the killing qualities of this fly. All fish are attracted more by the action of the fly than by color or form. * * * This fly will certainly, when drawn against the current or over a placid pool, *seam* the surface with an attractive wake, and its expanded wings will create a fluttering motion, assimilating the struggles of a live insect. * * * We are told that few fish are lost by those who use this fly. We do not doubt it."

A NOTABLE ART ENTERPRISE

The Sportsman's Reverie.

A SERIES OF PICTURES FOR SPORTSMEN.

READERS of the FOREST AND STREAM cannot fail to recollect Mr. Thomas F. Watson's poem entitled, "The Sportsman's Reverie," printed in this journal about two years ago. Later on a few stanzas were added to cover other scenes of typical American sport with the gun. The author depicted vividly the varied visions which come before the view of the veteran sportsman as he sits in easy chair before the fire. Of the author and his poem the *Detroit Free Press* said in an appreciative notice: "The author is evidently a man of the most acute sportsmanly enthusiasm, as well as of nice literary taste. His poem is built upon a very simple plan. Before a cheerful fire—like Ike Marvel's hero—sits a veteran of rod and gun; he grows half drowsy over pipe and fire and the poet has caught—with a nice and sensitive appreciation—the reminiscences of a hundred hunts which flit through his brain. One experience after another is described with graceful pen touches; the quail, the woodcock, the snipe, the deer, fall before the crack of the gun; a long day's sport—a glorious day such as no man ever compassed between sun and sun—is described, even the trout, from the clear rapid, paying tribute to the prowess of a dreamland sportsman, until at last, with the fall of the quiet night shadows, the sportsman draws his boat to the shore, his tired retriever crouches at his feet, and, with his ducks, the final trophies of his sport, at his side, he looks back over the darkening water; and then, once again at his fireside, the end of the vision comes naturally and gracefully."

And now these "word pictures" of the poet have been complemented with the actual canvas pictures of the painter. Artist-poet and poet-artist have united to give us the poem in a magnificent setting. Mr. Robert Hopkin, the celebrated artist of Detroit, has painted a series of twelve pictures, each telling in color what the poem tells in words. From these paintings have been made superb heliotype engravings, each having beneath it the particular verse of the poem illustrated. The series is remarkable for strict adherence to nature fidelity in portraying action, and artistic merit.

THE TWELVE PICTURES:

No. 1 shows the hunter seated in an easy attitude in an arm chair, gazing reflectively into the fire on the hearth. Above the fireplace are the head and antlers of a deer. The sportsman's right arm is around the neck of his dog, which is resting on his haunches beside the chair. His left hand holds his pipe. The firelight flickers on the floor and around the legs of the chair.

No. 2 represents dawn breaking over a small lake. The night shades are fleeing. A mist is rising from the eastern end of the lake, of which trees fringe the edge. A plover is circling in the air, and in the foreground is a mallard lazily flying out over the glassy water.

No. 3 represents snipe shooting. In the foreground is the sportsman, his body twisted around to the left in the attitude of making a double on snipe. Standing beside him is the setter, waiting for the word to retrieve. To his right is the border of a wood, the branches bending to the strong wind. In the distance are the sails of craft on the lake.

No. 4—woodcock shooting—shows an opening in the copse around whose border a brook is winding. In the foreground, standing deep in the ferns and rank vegetation, is a setter on a point. Behind the dog is the sportsman in the attitude of shooting at a bird flying directly over him.

No. 5 shows a quail hunter in the foreground, walking along ready for the shot, which will follow the rise of the birds, on which the dog is drawing to a point. A haze is over all, and the sky is that of a day in Indian summer.

No. 6 depicts grouse or partridge shooting in the beech woods. The hunter is walking down a slope. The dog has come to a point ahead of him. The bird has flushed and the hunter is shown aiming. The pointer has stiffened into an attitude of strained attention, as he watches the bird fly away. The upper part of the sportsman's body is in the shadow, the lower part in the strong light of the sun rays.

No. 7 shows an angler reeling in a trout. A brook is tumbling down through the woods and over the rocks into the pool. The sky is cloudy and the sunlight is struggling through.

No. 8—deer shooting—is a forest scene. In the foreground a buck, just shot, is falling on the edge of a lake. Tearing down the slope behind him are two hounds. To the left, behind the roots of an upturned tree, are seen the head and shoulders of the hunter, whose rifle is still bearing on the deer.

No. 9 represents shooting over decoys. A gale is blowing and the water of the channel outside is lashed into whitecaps. In the bay the decoys are tossing in the chopping waves. In the foreground is a point of rushes, in which the skiff of the hunter is partially concealed. The flock of ducks, which has just swung in outside the decoys, is broken by the discharge of the first barrel. One section is wheeling out over the river. The other has broken off to the side and is wheeling out again to meet the first section. Some scattered birds are dashing above the head of the hunter, and he is twisted around in his skiff aiming at a bird flying above and behind him.

No. 10 shows flight duck shooting. The scene is a marsh, on whose broken surface the sun is setting behind the clouds. In the foreground, on a grassy point, are the hunter and his spaniel. The hunter is in a kneeling attitude and in the act of firing his first barrel. The spaniel is plunging into the water to retrieve the bird which has fallen to the first barrel. In the distance are flying ducks.

Nos. 11 and 12 represent the hunter retiring from the marsh and at home, and these two are among the strongest of the set.

The pictures are printed on the best 150lb. plate paper; size of paper 24×30in.; size of print 14½×17½in. The pictures have the tint and tint border, and the artist's remarque and signature, and form artist's proofs, an édition de luxe.

PRICE, $30 FOR THE SET; SINGLE PICTURES, $3.

The Forest Waters the Farm;

OR,

The Value of Woodlands as Reservoirs.

BEING THE LES ÉTUDES DE MAITRE PIERRE SUR L'AGRICULTURE ET LES FORETS.

PAR M. ANTONIN ROUSSET.

Translated by
REV. S. W. POWELL.

The introduction reviews the extraordinary movement of torrent taming in France, in preparing public sentiment for which the Studies of Master Peter played a noteworthy part. The book was written as a sort of science primer, setting forth the first principles of the relations existing between woodlands and agriculture. The principles and reasoning are not less applicable to the United States to-day than to France then.

Price in cloth, 75 cts.; paper, 50 cts.

ANSWERS TO CORRESPONDENTS.

CO-OPERATION.

IN union there is strength; why is not the wisdom of the old adage more generally adopted in our endeavors to conserve the game and fish supply?

For a pertinent example take the Massachusetts Fish and Game Protective Association, with headquarters at Boston. This is a society of large membership, decided influence and unquestionably high purposes. Yet through the State, among country sportsmen, there is found an undercurrent of distrust and jealousy of this Boston society, based largely upon the mere fact that it is a Boston, which is to say a city, organization, made up of "city sportsmen." We have often referred to the supposed or imaginary conflict of interests between city sportsmen and country sportsmen; and have repeatedly endeavored to point out that there should be no such conflict, for what is for the good of one class is in equal measure for the benefit of the other. The distrust and jealousy, however, persist, and by reason of their persistence much of the game and fish protective work undertaken in Massachusetts is thwarted and much more that ought to be undertaken is left undone. If city and country representatives of the cause could join hands in hearty accord and "pull together" we should soon see a change.

The Boston men are anxious to secure the active aid of outsiders. As one means of making known the character and purposes of their society, they propose to invite members of country clubs to attend the monthly meetings of the Association. It is expected that some of these club members will be present as guests at the next meeting on Nov. 21. The acquaintances to be formed in this way can hardly fail of beneficial results, and if with a better understanding of the common interests and purposes of each, city and country clubs can be induced to work in unison, there will be well-founded hope for speedily accomplishing ends not to be attained by working at loggerheads.

There ought to be in every State in this Union an association of local clubs, banded together for the express and single purpose of seeing to it that the authorities enforce the laws. Trap-shooting societies will never do this. The old organizations, game protective in principle and trap shooting in practice, have now for the most part died out. They have at least so far disappeared from public gaze as game protectors that new societies, organized to fill their places, could not be regarded as in any sense rivals or opponents. The way is clear for new State game protective associations; and if those well-intentioned individuals who are working bravely to establish a grand national association will instead of this concentrate their efforts upon the organization of State societies, their labors will not be so surely for naught as they are at present. Co-operation is a capital thing in its way, but compactness and concentration are also essentials. A State association made up of town and county clubs can do something besides talk. A national association made up of clubs from all over the country can do nothing but make speeches and pass resolutions. And resolutions as game protective cure-alls have had their day.

NEW JERSEY NON-RESIDENTS.

NEW JERSEY has a curious system of treating non-residents who may wish to shoot off a gun within her boundaries. The law says that no person not a resident shall hunt or kill game or catch fish "in this State without complying with the by-laws of the game protective societies organized or to be organized under the laws of this State," and it provides a fine of $50 with the option of lying in jail for violation. This law does not say that a non-resident must join a society. It only says he must "comply with the by-laws." Does that phrase "comply with the by-laws" mean "join the society"? It is so interpreted by the societies themselves. They arrest and fine non-residents on that very ground. Joseph Travis, of Philadelphia, was arrested and fined $50 and costs by Justice James Cassidy, of Camden, on the charge of gunning without a license, *i. e.*, a certificate of membership in the West Jersey Game Protective Society.

It is a very curious system. Several persons who have been made to pay up in times past have expressed a determination to carry their cases to higher courts for a decision, but they have always paid their fines and dropped the contest without actually making any test of the law. This is a great pity. A friendly suit to determine the intent of the law, the interpretation to be put upon its wording, and the authority given by it to these societies to seize non-residents and lock them up, would be watched with much interest and might teach some valuable lessons.

NOTES AND COMMENTS.

SUNAPEE LAKE, New Hampshire, has been systematically stocked by the fish commissioners, and the fishing is constantly improving. The lake is a beautiful body of water, at a high altitude, with charming surroundings. Its development as a fishing resort is an excellent example of what might be done with scores of lakes in New England and elsewhere, if public spirit and forethought were to be brought to the task. Sunapee will be one of the famous angling resorts of the near future, and the citizens of the State will reap the benefit in railroad and stage fares, hotel, boat, guide and other revenues.

We shall begin shortly the publication of a series of papers by Prof. J. W. P. Jenks, of Brown University, relating his experiences and adventures during the winter of 1874, while hunting in the Lake Okeechobee region of Florida. That was not so very long ago, but the changes there have been so rapid that the author's account of his wild life with wild game and wild outlaws will be like ancient history to Florida readers.

An Oxford, Md., company has been organized to prepare oysters for shipment abroad by a novel method, which has been recently patented. All there is to it is simply to fasten the shells of a live oyster together so that they cannot open. The oyster and his liquor fill the shell completely, says the inventor; but after being kept out of the water for a time the creature opens its shell expecting to feed, a portion of the liquor is lost, air takes the place of it, and the first stage of decomposition sets in. If the shell be so tightly clamped that no atmospheric air can enter, the oyster will subsist on its own juices for a period of sixty or eighty days, and at the end of that time will be in good condition to be eaten. This is not all theory; experiments have proved the success of the method. The new industry of oyster clamping is in full working order at Oxford. Iron wire is employed to fasten the shells, and the firm is filling a large foreign contract. If the process will work with oysters we see no reason why it should not be applied with equal success to clams, and here too the American fishermen who use clams for cod bait may find a hint toward the solution of the bait question.

Another specimen of amateur photographer's work comes to us from Dr. Henry G. Piffard, of this city, whose invention of a "photographic pistol" for photographing in the dark was recently noted. The method consists in igniting powdered magnesium on gun cotton and taking the instantaneous negative by the flash. Our suggestion that it would be possible by one pull of the trigger to photograph a coon at night and bag it too appears to have prompted Dr. Piffard to produce the portrait, which is that of a darky made with the photographic pistol at 9 o'clock P. M.

Senator John E. Kenna, of West Virginia, is a fox-hunter, fisherman and amateur photographer. He is enthusiastic in each of these pursuits, and excels in all of them. We are reminded of this by receiving a specimen of his work with the camera. It is a group of fishermen on Howard's Creek, Greenbrier county, West Virginia, in which the excellent portraits are recognized as those of Messrs. A. N. Cheney, W. D. Cleveland and the Senator himself.

Non-export game laws cut off the market-hunter, but hotel landlords frequently complain that they suffer too because sportsmen will not go shooting where they cannot send their game home or take it home with them. This is in a measure true; several instances have recently come to our notice, where men who had been accustomed to make an annual excursion to certain localities have now given it up for this very reason.

Memphis, Tenn., is a desirable point to start out from for Southern game. We have information that game of all kinds is unusually abundant this season in the Mississippi River districts reached from Memphis. The facilities for traveling from Memphis to the game regions of Mississippi and Arkansas are as good as possible, afforded by the several radiating lines of railroads and the Mississippi River and tributaries.

Redditch, England, it is said, turns out 20,000,000 fish-hooks every week. The total of the annual product taxes the imagination. If one is to believe all the talk of returning fishermen, a goodly number of these are swallowed by "the big ones that got away," but even then, the mystery of what becomes of all the rest is almost as great as that of where all the pins go to.

Among the good things in store for readers of this journal is a series of sketches relating the experiences of Sam Lovel and his friends in June and autumn camps. It has been intimated to us that before the papers are completed we may hear something of how Uncle Lisha fared out in 'Hio.

The AUDUBON SOCIETY has not done so much that no more remains for it to do. The membership is not so large that it ought not to be quadrupled. The sentiment against bird destruction is not so universal nor so emphatic that it needs not to be encouraged.

"Uncle Lisha's Shop" in book form is just as good reading as it was when printed in the FOREST AND STREAM Perhaps better, for it will bear a second reading and improve with it—which is more than can be said for nine-tenths of the books that come from the press.

The individual heralded as "Jo-Jo, the dog-faced Russian boy," or human Skye terrier, would make a decided sensation at a bench show, and it is surprising that no enterprising managers have had the forethought to secure him.

Senator Vest is preparing an article on the National Park for the *Century*.

The Sportsman Tourist.

A DEER HUNT.

"FOUR days in camp, four days of blinding snow
And bitter cold, monotony and smoke!
If this be pleasure 'tis a pleasure I
Shall henceforth shun with pleasure," Ernest cried,
As seated round the blazing camp-fire logs
We smoked and talked, the while the storm without
Wailed through the great woods like a Titan's ghost
Till near to midnight, when it passed away.
But when the first faint glimmer in the east
Bespoke the dawn, we rose and breakfasted,
Prepared our luncheon, laced our snowshoes on,
And, gun on shoulder, sought the open plain;
The blood of each one coursing through his veins,
And robust health felt to the finger tip.
O'er mile on mile of pure untrodden snow,
Save where the subtle fox had left a track,
Or playful rabbit bounded fleetly o'er,
Due northward toward a gently sloping hill
Some three leagues off, against a frosty wind
That came to meet us from the sullen north,
And tried to "nip" us as he passed us by.
We traveled on, good cheer in every heart,
Till three hours' walking brought us to the top;
And then we saw—oh, lovely, thrilling sight!
The joy of which none but the hunter knows—
Our game at last. For on the plain beneath,
Between us and the margin of the wood
That hemmed the barren in, lay all at ease
A dozen deer; due windward from us, too,
And scarce a mile away. "Ours! Sure as fate,
They must be ours!" thought all; and every heart
Beat higher with excitement; every eye
Beamed with the hunter's fire, as flashed the horns
Of the great leader in the morning air.
Then ere another hour four loud reports
Rang out against the wintry silentness,
Awaking echoes from a thousand caves
Which answered back again, and stretched at length
Four deer lay bleeding on the trampled snow:
While Ernest shouted, "Good! the leader's mine!"
And was as happy as a joyous lark
That sings in heaven on a summer morn.

NORTH SYDNEY, Cape Breton, Nov. 1. H. E. BAKER.

THE OPEN AIR.

A COLLOQUY.

Evening in a camp on the shore of a lake. Three men—one a guide—and a youth of twenty are reclining within comfortable distance from a log fire. The youngest of the group, turning his eyes overhead, speaks:

Henry. That was a night hawk charging down us. Why is it that he makes that tremendous whirr and swoop? Is he merely having his fling, or is it a business method? I should think he would frighten every bug and gnat off his preserve.

Paul. I don't know, I am sure.

[*The silence is uninterrupted for several minutes.*

Henry. I am tired and comfortable and would be at peace with the world if I hadn't broken my rod on that bass to-day. But, "let that pass," as they say in the play.

Paul. Haven't fishing and shooting and taking to the woods come to be a sort of fashion, of late? Isn't it what they call "good form" for people who can find the money and the time to go rusticating in some way at least once a year?

Peter. I think it is a good thing.

Paul. Of course, but I am suspicious of fashions. How much of it is not genuine? How much of it is done chiefly because it it the proper thing to do, because Lord Dunraven having gone, and Mr. Charles Dudley Warner having gone, for instance, and both having written so pleasantly about it, or because the President of the United States goes and takes his wife, or because it's confessedly "English," maybe, to shoot and to fish, why therefore "all the world" taking note thereof must go too, and not for any real love or appreciation of it. Is there anything in this?

Peter. Not so very much. But there is a class of persons who take perhaps one experience of outdoor living for some such reason as you express. Their after-experiences, if they take another, are had under the protection of a hotel or boarding house, bordering on the woods, and where the real thing is only in sight. A good many of the men are satisfied to spend their days dawdling in boats, and their evenings in flirtation and dress clothes—actually dress clothes, I am told. Thank fortune I never saw them there. But they are few I have no doubt. The charm of outdoor life works readily with most men. The fascination of it I have never analyzed particularly. The love of men for nature is an old story.

Paul. Perhaps the individuals I referred to are exceptional; as exceptional, for instance, as the man who has not music in his soul. I question whether they are much "fitter" than he either. But I have always thought that he was too harshly condemned. It is misfortune enough to be born into the world without appreciation for music without being accused of undeveloped treason into the bargain. But, speaking of it, is it a demand of our nature that brings you and me and so many others off year after year like this, making us lie on these hard stones at night and run the chance of missing the milk in our coffee in the morning and being caught out in the rain, or what is it?

Henry. Did you see that shooting star? There! there! What a fine tail it had. I don't think I ever saw one from beginning to end before. I am always looking the other way. Comets are preferable. They keep in one place while you look, and display themselves at a standstill. You are never startled out of your wits by some one clapping you on the back and crying out, "See! see! Ah, you're too late." I never knew of a comet, however, that you didn't have to get up in the middle of the night to look at, which is a drawback.

Peter. Men whose fondness is for fishing and shooting would, perhaps, explain it all by referring you to the excitement of sport. It stirs the blood, for example, to throw a fly on some good stream after trout. Every pool and rift and bend opens new possibilities. One forgets himself and all his worriments. You are looking for a rise and it don't come, and it still don't come. Then you get it, half unexpectedly. He isn't hooked. You try him again. The fly trails along the dangerous edge of the willow roots. Then he takes a good hold—he is a pound, two pounds, and he seems four. You battle it out with him and he goes into the basket. I have heard of a man who more than one morning came down to his salmon river ready for the day's business, and who as often went back to his quarters without wetting his line, so little, for some reason or other, did he trust his nerves to the excitement. A flock of ducks crowding into the decoys will set any man's heart thumping away. Even hunting the rabbit has excitement in it. You are continually on the *qui vive* as to whether from behind each clump of leafless bushes there will start the small white form across your path on the snow, and whether it will be away and out of sight before you can get your gun to your shoulder and bring him down. A light, please. But that's not half the secret of man's fondness for out of doors, I suppose.

Henry. Perhaps not, but it's enough, unless you go further and say that it is a poor day that brings no squirrels to the bag or fish to the basket. That is my doctrine. And if you two proceed to philosophize further on the subject I go to bed. I am tired enough already.

Paul. That is the old love of the chase. I suppose it is in our blood. With some it is the one coarse strain. I knew an Englishman, a gentleman and a "scholard," too, who, let a rat run across a dining-room floor, as rats will sometimes in well-regulated households, would positively get wild with excitement. While the women were getting on chairs and the other men getting out of the way, he was after the rat like a rat-terrier in a rat pit. His eyes blazed, and his expression grew set and determined and almost ferocious. I have seen him corner the beast, seize it at the back of the neck with his bare hand, and crush the life out of it between his fingers. Wasn't that in the man's blood?

Peter. Don't you think it comes from what our ancestors were compelled to by their necessities? Meat and skins were their pursuit. Then the art of men found easier ways of getting food and clothing, and with civilization the business of following game lapsed or rose, whichever it should be called, into the pastime of kings, the nobles, the rich and the people. It's natural, exciting and, moreover, healthful to hunt and to fish. There's reason enough.

Paul. But it is not the whole story by any means. I don't agree with Harry that to catch fish and bag squirrels is all there is of the attraction in outdoor life. When he shall have lived as long as I have and had as many unsuccessful days, I predict his fondness for it will be hardly less, if it is not greater, than it is now. This is our mother earth, and has been our father's, and in a way we recognize and appreciate her maternity. It is a delight to wander over her fair surface where the hand of man has changed her appearance the least; to lie on her broad bosom—in warm weather—and rest, as it seems to us we can only there rest, out of our tired and anxious bodies the weariness that comes to all mortals. That is refreshment. It is sufficient for you and me to have seen to-day on that slope over yonder the fresh green grass, to walk, as we did, through those woods where silence and dignity and peace seemed to reign as nowhere else, to have heard the liquid talking of the little brook back in the swamp. You are getting quite enough enjoyment now out of these surroundings—the lake, the stars up there and that lapping water. You can do without Harry's string of fish.

Henry. Good man, Paul, you talk like a book—like the little brook. Take a drink of this fine water which I dipped from afar in the mere, as it were. Don't let the wheels of loquaciousness lack oil for their dry cogs, so to speak, or would you prefer a glass of—what, William, a glass of ——

Peter. "Come to these scenes of peace,
Where to rivers murmuring
The sweet birds all the summer sing,
Where care and toil and sadness cease."

Harry. Et tu, Brute!

William. Mr. Henry, here is the glass of ——

Henry. Thanks.

Paul. That's the idea. Early in the life of man on earth he tilled the ground. From that source he has continued to get his chief subsistence. That has brought him out of doors and given him an inclination for things that lie out of doors—the phases of spring and summer and autumn, for instance. There partially originates the impulse that pulls and hauls at you and me after a long cooping up in the house. Who can tell? Like the starling we want to get out. So men invariably look with respect and regard on a garden. Men of affairs seem to retain a repressed love for a farm, and, if they can have it, take a country retreat in which to pass their declining years.

Peter. There is this, too, that is not to be overlooked—the beauty that is out of doors. It is simple, true and unaffected. The artificiality that is ever recurring in man's attempted creations of beauty—his art—to mar and blight his work has no place in nature. That goes without saying. And yet with her the very heights of all conceivable imagination and display are commonly reached.

Paul. Yes, and I have for that reason sometimes idly thought why it should be that so many pictures are painted of her and why it is that we value them as we do. For, consider, the best of them, the only strong ones, do but reflect her in some aspect or mood, and yet there she is everywhere about us, to be viewed directly for simply the going out. Doubtless it is because that in this way alone are held fast and still for us scenes and expressions of nature that are of necessity shifting and changeable, or because pictures bring in from out of doors trees and vistas and landscapes, for instance, which to go abroad and see is beyond our ability or convenience. But, that speculation aside, the beauty that lies out of doors is a most powerful attraction. There are the colors and forms of grasses, of flowers, of weeds, for example; what an endless and charming variety! They droop and bend on the most graceful stems or are raised on stalks whose beauty is enhanced by their absolute fitness. Even the bare limbs of trees swayed in the winds of winter with their irregular branches and twigs never fail to please the eye whatever turn or twist they take. You have felt the spell of natural beauty on a river—some broad stream—when the sun has sloped so far in the west that the shadows have grown long on the water. The background is a hill, perhaps; beyond it and above lies the translucent blue of the sky. On one side the banks are wooded, showing deep recesses, tang'ed with creeping vines and bushes; on the other, they come to the water's edge in green meadows, fringed with crowding breaks and bending ferns. Next grow the rushes and plumes of water plants, lilies and weeds, and before them all, above, below and all about, the water ripples and eddies and breaks in sparkles, with quiet murmurs or in silence. Nothing could be fairer. The beauty of it transports, elevates and satisfies. It is one of a host of scenes equally fine. The wonder is that the men do not oftener leave their dwelling places indoors filled not unlikely with the gimcracks, the toys, the artificial embroideries and decorations of human device and go out and refresh themselves in the sight and reach of the divine creations beyond their thresholds. To some extent our inherited love of the chase and our inclination to throw ourselves on the lap of mother earth explain our love of out of doors, but beside these causes our sense and appreciation of beauty explain it.

Peter. You remember that Tennyson has a poem called the "Palace of Art." It describes a palace where the soul was to dwell apart from the world in the companionship of philosophy, learning music and art. The rooms of the palace were hung with pictures. They are from nature and illustrate its beauty as this poet can. What you are saying reminds me of them. He says:

"Full of great rooms and small the palace stood,
All various, each a perfect whole
From living nature, fit for every mood,
And change of my still soul.

For some were hung with arras green and blue,
Showing a gaudy summer morn,
Where with puffed cheek the belted hunter blew
His wreathed bugle horn.

* * * * * * * *

And one the reapers at their sultry toil,
In front they bound the sheaves. Behind
Were realms of upland prodigal in oil
And hoary to the wind.

* * * * * * * *

And one, an English home—gray twilight poured
On dewy pastures, dewy trees,
Softer than sleep—all things in order stored,
A haunt of ancient peace."

Paul. That is fine.

[*A lull in the conversation. Henry, who had withdrawn to his sleeping place under the boat, gets up, and after pulling some heavy logs across the diminished fire, muttering meanwhile some reflection on people who do not know enough to go in when it rains—albeit the night is clear and starlit—returns to his couch and is soon asleep. The others follow not long after. Being finally settled beneath their heavy blankets, Peter resumes:*

Peter. But that Palace of Art failed. The soul could not keep up its making merry as the builder of the palace would have it. The fine architecture, the fountains, the pictures and the company of the poets and philosophers failed to satisfy, and it begged for a cottage in a vale where it could mourn and pray.

Paul. There is yet a deeper secret. We are constantly groping for a hint or suggestion of another world—of the hereafter. Whence we come does not bother us so much as where we go after this life. That is the puzzle ever before us when we give ourselves time to think of death, of a future life, of infinity, and all that. It often occurs to me—it is no new suggestion—that this same contact with the outdoor world, the living in sight of mountains, beside the ocean, where the great expanse of water stretches on and on to join the sky, where the storms are the most felt, where the horizon, the edge of the earth, is visible, and all the mysterious phenomena are on display, that such a life brings men nearer to the bourne from which no traveller has returned, nearer to the Creator than any other. If thoughts of religion do not come to a man there, will they ever come to him? "The groves were God's first temples." Are they not his best?

Peter. You talk like one of Ruskin's books.

Paul. Let your mind travel up among those stars. Imagine following the line of light from that star—Arcturus, isn't it?—on and on to the star itself, and conceive that, as you move up, and up, and up, its apparent growth is hardly perceptible, although you travel thousands and thousands of miles. But infinitely little by little it enlarges, and at length discovers itself a great black planet wheeling in space, its distance from you still immeasurable. It may be tenfold larger than this earth on which you and I are mere specks. Beyond that star, in every direction, lie thousands of others, which if seen from it are mere pin pricks, as it now is from us. Then go the other way, down to a grain of sand on the seashore, and from that imagine the diminution to the atom of the physicists. No man whose senses are not dulled to stupidity can regard these things without awe and without marking the omnipotence in creation. Out of doors there is this suggestion; within the hint is a hundredfold less. You noticed the broad golden reflection that the sun made on the quiet water from the horizon to our feet as it set to-night. It was smooth and burnished, and looked as firm as a road. For some reason it aroused my dull imagination to a fancy—childish, perhaps. It seemed to me as if it might be a pathway to the other world—as if it led up to its very portals among the bright clouds. Surely any dreams of a future glory could hardly fail of fulfillment in the glory that must exist in the regions to which such a pathway goes. And on some midsummer day, one of a succession that have been hot and clear, you have observed those great cumulus clouds that stand motionless all the day along the horizon. As a boy I used to think that behind them must lie the promised land. To me they were the grand and stately barriers between this world and another that was at least as peaceful, bright and beautiful as this. Toil up and over their folds, soft and billowy, yet firm and steadfast as any hills, and behind them surely would be found the cities of the Lord. I don't much doubt but that such sights help out the dull faculties of mature minds as well. And storms, impressive as they are seen from a window, convey an adequate sense of their unlimited but restrained power only out of doors—and not in towns and among houses, but off on the hills and prairies and by the sea. Then comes to a man a sense of his weakness and inse-

curity. Then he thinks, "What if there be no omnipotent hand in which I am kept?"

But these striking things of nature are not essential. I don't know that I can make my idea clear. Is it not in the Bible that the hills are spoken of as "hallowed?" If not, where is it? The fitness of that expression is understood if there is an appreciative acquaintance with the world of nature. It is hallowed; the world of cities is not. In the one there is a spirit, divine, infinite, abroad everywhere. A voice tells of it to those who are attuned to hear. It speaks from quiet skies, from open fields, on calm and sunny days, from forests, from streams, from haunts of birds. The simplest thing that grows repeats it. Your same Tennyson says:

"Flower in the crannied wall,
I pluck you out of the crannies;—
Hold you there, root and all, in my hand,
Little flower—but if I could understand
What you are, root and all, and all in all
I should know what God and man is."

What, Peter, are you asleep, too? G. T. C.

A COUNCIL OF THE SENECAS.

IT was away back somewhere in the twenties, that I was a privileged spectator, during the performance of the rites and ceremonies, of an Indian council or festival; inproperly called by the whites a green corn dance. This festival was only a repetition of the annual gatherings which were then prevalent among the several tribes of the Seneca nation. Their council house was built of hewed white pine logs, 25x50ft., squared and dove-tailed at the corners, a low structure, old and time-worn, and had evidently been built and occupied by a generation that had gone before. It was situated near the Alleghany River and in front there was a grassplot of perhaps an acre, on which were many white oaks of ancient growth, while in the rear of the house was a dense thicket reaching up to the building.

On the first day of the gathering the time was mostly occupied by the young braves, in archery practice, which was at that early day made a specialty by both old and young. Nearly every hour during the day the squaws were dropping in from every direction, each loaded with the inevitable pack-basket, of a bushel capacity, containing the camp cooking-kit, and the white Mackinaw blanket rolled and strapped on the top. There came also several of the best hunters who had been sent out for deer, returning by twos and threes, loaded with venison; and when night closed in the numerous little camp-fires dotted the whole foreground, lighting up under the oaks, reflecting a canopy of the sere and yellow leaf of October.

The next morning the sun shone dimly through the hazy atmosphere of an October Indian-summer day, and the odor of cooked venison steamed up from a hundred soup kettles. By 10 o'clock the seats in the council-house (which were only rude benches) were filled. The old and influential men of the tribe occupied the front seats, while the young males filled the back seats, and here the affairs of the Nation were discussed for six long hours; during which time perfect silence reigned through the house, while the several speakers held forth with that deliberate reserve characteric of the old-time Indian.

At an early hour on the third day, as many of the assemblage (males and females) as could be seated, were gathered in the council-house. On the ground-hearth of a rude fire-place was a small bed of live coals, in front of which on a low stool sat an aged chief, a sort of spiritual adviser, a prophet who, I should say, by the marked respect which was shown him, was not without honor in his own country. He arose, and after speaking a few words to the assembled natives, turned his back to the audience and talked to the Great Spirit for a half hour or more, during which time he kept feeding the fire from the contents of a raw-hide pouch which hung from his belt, and from the smouldering embers floated an odor of burning tobacco, mingled with the invigorating fragrance of aromatic herbs and the pulverized bark of the green osier.

And much, t'was said, of heathen lore
Mix'd in the charms he mutter'd o'er.

When his petitions and thanks-givings were concluded he turned around and addressed his people for three-quarters of an hour. Having so imperfect a knowledge of the language I could only get the drift of his discourse, the substance of which was an exhortation to honesty and good works, and a solemn charge to shun the white man's fire-water; and he dwelt long and earnestly on the baneful effects which it had on the red man. But that old Indian did not live to see one-half the evil effects of intemperance that in after years so demoralized, debased and desolated his tribe.

A change of programme for the afternoon performance was evident by the removal of the seats from the center of the building, leaving a circular space between the front and rear door of about 25ft. diameter, in the center of which was a raised bench or platform about 4x6ft., and at each end sat an Indian, one of whom had a rude apology for a drum, made of a section of bark slipped from the body of a bass-wood tree, the split side being closed up with thongs, and it was about the size of a common nail keg, with a rawhide strained over one end, while the other had a dried gourd shell partly filled with small pebbles. Before I was really aware of it, the seats were filled without noise or confusion, while the number of those outside did not seem to be diminished much. An Indian, who subsequently proved to be master of ceremonies, mounted the platform dressed in a bleached cotton shirt, clasped in front with numerous large silver broaches, and girt with a scarlet red sash, a similar red scarf being tied around the head, leaving his flowing black mane hanging loosely over the shoulders. His moccasins and leggings were elaborately trimmed after the Indian fashion of those days. Over the left shoulder hung an empty quiver, and in his hand was a short, tight-strung bow. He of the drum commenced a monotonous beat, which drew in a mixed crowd of old and young, keeping step with the beat of the drum until a ring was formed numbering twenty-five or thirty. These, after making one circuit, suddenly piled out each door, and as if by magic the ring was as quickly filled with painted warriors. They were dressed similar to the manager on the platform with some additional headgear and most of them had a string of small brass plates, the size of oldtime pennies, which were fastened below the knee on each leg, and each carried a peeled rod about 2ft. in length and perhaps ¾in. in diameter. They now started on fast time, which was a sort of double beat on the drum, that is a heavy beat and a light beat very near together, and at a signal from the Sachem, every other one turned face to the one in his rear and the rods were used as foils. It was something like fencing in sword exercise, and the click-click of those sticks, the yink-yink of the brass plates, the flat-footed double stamp and the jerky rattle of the pebbles in the shell were all in exact time with the beat on the drum.

This performance continued until all had made the circuit of the ring, and as they made slow headway it required some time to complete the circuit, when they were brought to a full stop by a peculiar flourish of the bow by the Sachem who occupied the platform. Another signal set them going on another course of acting, which was changed at every round, and kept up during the remainder of the day. It was a rare display of pantomiming, representing every phase of their ideal warfare, and was the most unique performance that I have ever witnessed.

That night the gathering broke up, and the day following I walked from the old council house down the long vista toward the river. There was not an Indian in sight. That dusky crowd of the day before had vanished, and there were only the usual signs of a deserted Indian bivouac.

Opinions seem to be divided on the much vexed Indian question of to-day. Doubtless a few decades more will solve the problem without much legislative action.

GRANDVIEW, Tenn. ANTLER.

PHASES OF SPORT ABROAD.

CORFU, Greece, Sept. 19.—*Editor Forest and Stream:* I have often thought, during many years of travel in Europe, Egypt and the Levant, that I would like to send home some notes concerning traveling, hunting and fishing. Of hunting I have had opportunities in plenty to send home interesting accounts, for we have spent a number of hunting seasons in different parts of Europe. I say send "home," for although I have lived many years abroad, my heart still clings to "the land of the brave and the home of the free," for my birthplace was Beverly, Mass., and I "growed up," as Topsy said, in the near vicinity of the "Hub." Last week I received a copy of your paper, and because we have such fun here laughing over the Greek hunters, I concluded to screw my courage to its sticking point and send you a few lines.

Since leaving home I have accompanied my husband, who is an indefatigable hunter, on the most interesting of his trips in different parts of Europe. My first one was for a day only, for hares and partridges at Ecaussines, about twenty miles from Brussels, Belgium, where my husband had hired a chase, consisting of 1,500 hectares (1 hect.=2 acr. 75.2 sq. poles) for 500 francs ($100) a year. The chase, aside from helping to kill time, did not amount to much, for although a hunting permission costs 45 francs ($9) which is a great deal of money in that country, and the hunting rules are rigidly kept, yet there are a plenty of amateurs also in the neighborhood of cities, therefore game is kept short. There one can go now and then, and must be satisfied if able to bag a couple of hares and a half dozen of partridges.

It was a different thing though when we went to Vianden, Grand Duchy of Luxembourg, a beautifully situated little town on the banks of the Our and commanded by the imposing ruined castle of the Counts of Nassau. The host of the Hotel des Étrangers, a young widower, had a chase of his own and was hunting crazy. He had two good dogs. The season for roe begins there generally in the middle of July, but we went for the commencement of hare and partridge shooting in the middle of August. Every morning from 3 to 6 o'clock, according to the distance to be traveled, began the halloo in the house—whistling for dogs, hurrying each other up, crying for coffee, scolding the dogs, the dogs themselves continually whining and barking for pleasure—until after an hour of this, one was glad of the chance of bidding them adieu and wishing them "Waidmann's heil" (hunter unhurt). But every day the booty which was brought home was satisfying in quantity and quality. My husband soon had numerous invitations to private hunting grounds. Later when the snow fell, commenced the "Treibjagden," where the hunters are placed on both sides of a ravine or on the ridge around a big hollow. Those who take part should be posted so that no game passing through would be out of gunshot. In an opposite direction dogs are let loose, and men and boys, under command of an experienced hunter, beat the bushes with sticks, whistling, screaming, hallooing and making noises with old trumpets. For a short time quiet reigns with the hunters, while bedlam-like comes up the sound from below. Of a sudden *yip, yip* is heard from one dog, then comes the cry from the driver of "fox" or "hare," then one dog after another joins in the grand chorus, the hunters are on the *qui vive*; one hears guns until the noise is deafening and the air is full of powder smoke. It is grand to witness on a cold, frosty morning, just as the lazy sun thinks it really time to rise from his couch. No hunter dare leave his post until the one who is at the head of the hunt blows the signal; then follows the meeting, and the "Jäger Latein" spoken of in "Camp-Fire Flickering," No. 221, commences. This one had seen such and such, another (a notoriously bad shot) would have killed his fox, which came direct for him, but a bush was in the way, and for all he fired, the right moment was lost. The stories are repeated so often, each time gaining a little polish, that in the evening, over beer and with pipes, the real original piece of the story is rather small. I have seen after a "treibjagd" a goodly quantity of game stretched out, for all that country can boast of no big ones; twenty to thirty hares, weighing each from 4 to 8lbs., four to eight foxes, and one or two roes. At noon, after perhaps three or four "drives," the hunters assemble, and over a good repast, which the host of the hunt provides, consisting generally of hot roasted potatoes, roast beef, ham, bread and a sufficient quantity of wine, the *pros* and *cons* of the hunt are talked over. I had some rare fun on those occasions, having made myself a dress of gray woolen cloth, trimmed with green, the skirt short, falling to just below the knees to the top of some stout, nailed, high boots, with trousers of the same, reaching down over the tops of the boots, with hat to match; and I was always invited to all such hunts, and one St. Hubertus chase was held for my express benefit. Sometimes a gun was added to my equipments, and although my shooting exploits generally consisted solely in frightening the game, it did not diminish the fun.

While at Vianden, my husband shot an old "keiler" (boar) which had been the terror of all the peasants and the destroyer of all their crops, particularly their potatoes. It weighed over 340lbs, had immense tusks, half worn off by age. The head was stuffed and now serves as an arms for a hotel in that village.

In December the salmon also come up the Our in hosts, springing up over the falls as if for sport, they do it so easily. They are caught in great numbers in nets placed by the falls and are speared by night from boats to which great torches are attached. The American salmon and a hybrid of that species and the European are both taken there. I have heard that this year the same sickness has broken out among them, as three years ago, and plenty of dead fish are to be seen floating around on the waters.

Our next hunting place was the "Hochwald" (high-woods) of the Hunsrücken, three hours from the Moselle, where besides the game already mentioned, the stag was added to the list, for there they are to be found in quantities satisfying enough to every hunter.

Now comes the best of all, hunting chamois in the Alpen of Lichtenstein. Many a time has the writer climbed with the hunters mountains there varying from 1,398 to 2,283 metres high (one m.=to 1yd. 2in. 4.5 lines). And many a herd of these graceful animals has she seen, varying from one to four dozen. The old males are generally alone or found in the neighborhood of two or three others. Two splendid shots did the writer also witness there. The whole of Lichtenstein belongs to Prince Johann II., of and from Lichtenstein, and the chases are held exclusively for him, although many years have elapsed since he was there. He lives in Vienna and is in poor health. The old hunter with whom we received permission to go, was one of the many employed for guarding the game against poachers, also for supplying the prince with game. One day we were with him in the Alpen, walking "Indian file" over a narrow footpath with a mountain looming up above us on one side, and a deep ravine yawning below us on the other, when almost simultaneously we noticed, some 200 metres high above, standing out on a crag, a chamois, as still and motionless as if carved from the stone itself, watching us intently with its beautiful great eyes; and disdainfully, too, as much as to say, "Here am I king, what harm can ye do me? I watch you poor plodders of the earth below with interest, feeling myself safe." But alas! After consulting together, my husband and old Lampert concluded, as the height and distance were so great, that it would be judicious to fire together; kneeling on one knee to be firmer, they fired at the word. I stood watching. The chamois made a half sommersault, happily to one side, where it fell into a gully filled with loose stones, and came sliding along down just ahead of us, but not dead for all it had two deadly shots. I am accustomed to seeing game shot, but as the chamois came into its enemies' hands, and I saw its proud, sad eyes, I experienced a queer sensation in the throat, and my eyes were not free from tears.

Another time when alone with my husband, we noticed through the glass a chamois lying asleep underneath some trees on the opposite side of another wide gully. Notwithstanding that the distance was great my husband made himself ready to fire, by moving a little forward and pulling grass out of the way. It took so long that I became impatient, at last crack went the rifle, the animal got up, moved two or three steps and lay, rather than fell down. He was distinctly to be seen through the glasses. After much calling to the old hunter, we got him near enough to scream out the circumstances and describe the place. But it was hard work to get there, to find and bring it away. At last he succeeded, but scolded and grumbled because it was so heavy. It weighed 68lbs. and was shot at about 300m. That night, after having been a week up in the Alpen, we walked home almost the whole distance, down hill, and over a good road when once on it, old Lampert carrying the chamois, I his gun and equipments, while my husband took charge of the rest of the things. The usual weight of those animals varies from 40 to 50lbs.

The following season we spent in Bavaria and in the Orient. One day on the banks of the Jordan, my husband, who was a short distance ahead of us, saw some half dozen boars clearing away in full haste over the desert, where they are hunted on horseback. Between Jerusalem and Damascus we saw some antelope, but always too far away to shoot. At Kefr-Hauwar, a place rightly called "Wind," we also visited the tomb of Nimrod, the first great hunter.

Last winter my husband hunted from here out in Albania until the soldiers were stationed there, then the sport was stopped, because if one gives "backsheesh" for the permission to shoot, one is still liable to be arrested, taken away into the mountains and kept there until a big ransom is paid for his release. The other day we were over in Albania for wild pigeons; the first day only a few were shot, the second day over eighty, by a party of four.

Now let me give my readers some idea of how hunting is carried on, and how the followers of Nimrod are rigged out here in Greece on one of the Ionian islands. The hunting permit here costs four francs (80 cents), and every man and boy is the happy possessor of one. For guns, one finds almost exclusively old one-barreled muzzle-loaders which are sometimes as long if not longer than the hunter himself. A decent dog is hardly to be found on the island; those used are curs, mongrels of the most disreputable kind, even to those no bigger than your black and tans. Imagine a hunter sallying out with such a gun, and such a dog, without shoes, or if he has shoes on they resemble moccasins with long turned up points, which are embellished with red and yellow tassels. Everything that flies, short of butterflies, is shot. The amusements of the present time are the beccafichi or fig-peckers; it is true that they are nice to eat, but such little bits of things—the daintiest dame could easily manage one at a mouthful. Singing birds also of all kinds are killed, from wrens to yellow-hammers. If one comes to the island, before its second song is trilled out it falls a victim to his pursuer's gun.

Rain is impatiently awaited now, for then follow the quail; if the weather clears immediately they clear also further on their migratory trip, but if storm with wind continues the hunters can expect a few days' sport.

TREE-CLIMBING RATTLESNAKES.

Editor Forest and Stream:

Some years ago I sent you an article for publication in your paper, enumerating a few instances coming under my personal observation, in which rattlesnakes had been found by me in trees and bushes during my ramblings on the western frontier. I wrote that article in reply to a note from one of your correspondents, who, as nearly as I can remember now, ridiculed Audubon's statement, I think, to that effect, and stated or implied that it was physically impossible for rattlesnakes to climb at all.

From what I have learned since I am inclined to the belief that the habit of our western species of rattlesnakes of climbing rough-barked trees, especially if these lean a little to one side, in pursuit of small mammals, birds and their eggs and young, is much more common than is ordinarily supposed to be the case.

A friend of mine, a young cavalry officer, recently stationed at Fort Huachuca in southern Arizona, an enthusiastic naturalist and a close observer, with whom I had been corresponding on this subject, writes me as follows:

"I have known of three cases of rattlesnakes being in trees.

"1. Once I was climbing a tree for a humming bird I had shot that had lodged in the top of this tree, and in a crotch of a limb I found a small male rattlesnake, and came nearly putting my hand on him.

"2. A small rattlesnake was found in a very large tree near our camp. A large peg had been driven into the tree, on which to hang nosebags. While the sergeant was handing them up one day, he was struck at by a rattlesnake hidden above the nosebags. I killed and skinned the snakes in both cases. These two instances happened in September, 1885.

"3. The third case occurred about April 30, 1887. I found the snake, a rattler, as I was climbing the tree to examine a hawk's nest. The tree was about 2½ft. in circumference, the first limb 2ft. from the ground. Two trees came from the same root, and half twisted together for a foor or 15in. The limbs were about a foot apart for the first 5ft., then the whole tree was a mass of fine limbs. The nest was placed in the top about 15ft. from the ground. The snake was a fair-sized one, about 3½ft. long. He was wound about the nest and coiled in a position to strike."

This tree-climbing habit seems, so far as my own knowledge goes, to be confined to our western species, but I have not the least doubt that the eastern and southern representives of this family are guilty of it as well, and as FOREST AND STREAM is so widely circulated in all parts of Uncle Sam's domain, I hope some of your readers who can throw further light on this habit of the rattlesnake will do so through your columns, especially as there is so much to be learned yet about the life history of these interesting reptiles. CHAS. E. BENDIRE.

WASHINGTON, D. C., Oct. 27.

WHAT IS INSTINCT?

IT is the popular and almost universl impression that instinct is a special gift of the creator, and not merely an inheritance from an ancestor. It requires but little investigation to prove the fallacy of this opinion. A fox is said to instinctively fear a man or a dog. Why? Because his ancestry had very good reason to do so, and he has inherited the feeling. To illustrate how a new instinct may be created, let us take a suppositious case. A fox is clearly not afraid of nor disposed to flee from one of his own kind. Let us imagine some foxes transported to a country where there are none of their kind, but instead an animal closely resembling a fox, only larger, much stronger, and very savage. Upon first seeing this new animal the fox might well be deceived, and would approach him with no other fear nor caution than they would exhibit at sight of any large specimen of their kind. But if the fiercer animal should turn upon the foxes and devour one or many, the sweet confidence born of ignorance would be quickly dispelled and the foundation of an instinct would be laid. That is to say, all those foxes which witnessed the deed would thenceforth give a wide berth to the counterfeit foxes. In other words, fear would then dictate flight from the stranger as the only means of safety. After one or two generations the young would impart the fear, and resort to flight at once upon catching sight of the devourer of their ancestors. Thus a new instinct, having a very sound utilitarian basis, would be developed. On the other hand, this new-born and inherited fear, the instinct, could be destroyed if the savage animal could somehow be divested of his savageness, and induced to treat the foxes like friends and brothers.

Ducks take to water by instinct—which means simply that their ancestors found water a very pleasant, healthful, and even necessary thing. They are watchful and afraid of hawks and large game fish, for the opposite experience of the same ancestors. Men and monkeys instinctively fear snakes, which is only saying that snakes have not been gentle and loving companions of other men and monkeys, back in the history of the respective races, and that the experience was transmitted as a strong mental impression. A woman is frightened by some object—say a dog or cat—and her babe may show instinctive dislike or even fear of all dogs and cats. If the babe arrives at mature age, and has on the way several unpleasant experiences with dogs and cats, the inherited dislike is intensified, and the descendants of such person would be likely to possess the original dislike in the form of a positive fear or hatred. If, however, there be no unpleasant experiences, but pleasant ones, the inherited dislike would probably disappear in the posterity.

Young wild turkeys, hatched under a hen, take to the woods because the inherited love of a wild, free life is superior to their liking for their second mother and for the restraints and comforts (?) of civilized life. Young grouse and quail hide under leaves and brush upon sight of the hunter, for the reason that he embodies to them a terror born of the decimating acquaintance of many generations of ancestors with other hunters. So the young birds shrink from the dog—their ancestral enemy—but have no fear of cattle, which never injured any of their kind—so too, dogs and other animals will not eat certain things that the experience of their ancestors would show to be hurtful.

The wonderful constructive capacity of the bee is often cited in evidence of the direct gift theory of the origin of instinct; but we have not to look far to find reason for the conclusion that it is only another case of heredity.

Old birds compared with younger ones become instructors in nest building; and so bees that have lived and worked through one season probably serve as guides and tutors to their younger brethren in the succeeding one. And then bees are born in a comb, and their "earliest recollections" must be of the peculiar form of its cells. What more natural than to imitate their ancestors when building a new home or an addition to the old home? What could be more unnatural and strange than not to do so?

But even if the above did not account for the comb-building capacity of bees, the law of inheritance does, for it applies to every organic structure. In fact the rule is that the lower the animal or insect in the scale of general intelligence, the greater his ability to follow the practices of his ancestors. Man, the most highly developed animal, has less "instinct" and greater power of abstract reasoning than any other. He is an apt illustration of the inverse relation of "instinct," *i. e.*, inherited capacity and tendency, to the degree of general intelligence or mental development.

Space will not permit me, and it is needless to multiply examples. Enough has been given to prove that instinct is merely an inheritance born of and embodying the experience of ancestors. It is inherited habit of thought or action. POTOMAC.

THE JACK SNIPE AS A RUSTLER.

Editor Forest and Stream:

I have to-day (Oct. 23) for the first time seen in your journal of March 24, 1887, my letter giving an account of a few jack snipe wintering in a very high altitude, passing unscathed through many cold snaps, one having the low temperature of 35° Fahr. Otherwise I should have long since recorded in FOREST AND STREAM the outcome of this erratic conduct of Jack.

The last record given was as to his being seen on Feb. 28, 1887. Afterward he was seen only one time during March, when on being flushed he rose high and took a flight to the north, doubtless to some spring that had by this time become "open." He was not seen afterward, but on April 1 three snipe were flushed at a spring about one mile below my ranch that had become "open" or free from ice. I take it that these were the snipe that had wintered in my meadows, as no open water was known for miles around. I felt curious to know on what food these snipe subsisted during the winter. I had no good reason to believe that they had eaten the bread and scraps of meat placed in their way, and think they must have lived on water plants, as it appears improbable that worms, their favorite food, could have been obtained at that season. I was at one time tempted to kill one of these birds in order to examine his crop to find "On what meat doth this our Cæsar feed" that he should pass unscathed through such a winter. From motives of humanity this thought was at once discarded. Birds that had proved themselves such "rustlers" had earned a right to live.

As was told in my first communication, at the time, Feb. 2, with temperature at —35°, the snipe was keeping himself from perishing by keeping his exposed legs in warm water, two of the genus *homo* perished from cold by disregarding the ordinary rules dictated by prudence under the circumstances. This is a well-stocked cattle range, yet during the winter about one-half of the cattle died from a combination of cold and starvation. Have not these snipe well earned the reputation of being "good rustlers?"

Apropos to the subject, a few days since, on Oct. 18, a jack snipe was flushed in the meadow. Can it be that this is one of the same snipe that wintered here last winter, that has become so enamored with the "bracing air" of this high latitude that he is desirous of trying the experiment a second winter? We shall see, and if he does, I shall report progress. The ground is not yet frozen, and he may yet pass south. This morning the temperature was —3°, and a search was made for him, but without success. Still he may be at some of the neighboring marshes. P.

WYOMING.

A JAPANESE SALMONOID.—A relative of our correspondent "Petra," residing in Japan, writes as follows: "The Japanese tell me that, as a rule, all fish are caught with nets, though occasionally the fly, with rod, is used. The 'ai' is what we call smelt. The new Japanese dictionary says, 'Ai, the name of a fresh-water fish, a species of trout (*Salmo altivalis*).' Fish here is cheap, and we eat a great deal of it, but there is no fish in Japan equal to our shad, and the oysters are small and dark." We referred this note to Mr. K. Ito, the Japanese Fish Commissioner who recently visited us, who says: "The Japanese fish referred to is *Plecoglossus altivelis*, Schlegel, and its Japanese name is more properly 'ayu.'" The genus *Plecoglossus*, which seems to contain only this one species, is one of the Salmonidæ, and, according to Gunther, is found in Formosa and Japan. It differs from the smelt in having feeble dentition, in having smaller scales, and in several other ways not exteriorly perceptible.

RECENT ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDEN.—Received by purchase—Two African porcupines (*Hystrix cristata*), one sandhill crane (*Grus canadensis*), and one whooping crane (*Grus americana*). Received by presentation—One common macaque (*Macacus cynomolgus*), two opossums (*Didelphys virginiana*), two gray squirrels (*Sciurus carolinensis*), one red-tailed hawk (*Buteo borealis*), two screech owls (*Scops asio*), one Ducorp's cockatoo (*Cacatua ducorpsi*), one coot (*Fulica americana*), two barred owls (*Syrnium nebulosum*), one golden-crowned kinglet (*Regulus satrapa*), one great-horned owl (*Bubo virginianus*), two golden eagles (*Aquila chrysaëtos*), one English blackbird (*Turdus merula*), one black coot (*Œdemia americana*), one lesser sulphur-crested cockatoo (*Cacatua sulphurea*), one garter snake (*Eutænia sirtalis*), and one alligator (*Alligator mississippiensis*). Born in the Garden—One common macaque (*Macacus cynomolgus*), and seven Egyptian geese (*Chelanopex ægyptiaca*).

Camp-Fire Flickerings.

"That reminds me."

224.

AN exciting, but rather foolhardy incident that deserves a place in the columns of Flickerings, occurred a few years since at Rockport, a small town on the Gulf coast between this place and Corpus Christi. I give the story in the words (as nearly as I can recall them) of one of the principal actors in the event, as related by him in the presence of a witness to the transaction. The question whether an alligator would attack a man under any circumstances had often been the subject of animated discussion among the members of the village, the affirmative and negative sides being about equally represented in point of numbers. P., one of the most ardent of the opponents of the affirmative side, was a young man of undoubted nerve, and although rather under medium size, he was possessed of more than ordinary strength and agility. He pooh-poohed the idea of the cowardly and ungainly saurian ever voluntarily attacking a human being or even defending himself from the attack of a man if there was a possibility of escape. P. frequently remarked during these discussions that should the opportunity ever present itself he would ride one in the presence of the whole community to prove the correctness of his side of the argument. The town is at the mouth of a small river. One night during a freshet an immense alligator came down the river, and reaching quiter water in the bay, swam along the shore and into a small basin near the wharf, where he was discovered early in the morning. The rest of the tale shall be in P.'s own words:

"Soon after I opened my store in the morning the boys began to drop in, one or two at a time, until six or eight were present. The conversation, at first on general topics, was gradually brought around to alligators. I took a hand in the discussion, and when some one presently remarked that 'they was mighty dangerous animals to fool with,' I shot off my bazoo to the effect that nothing would delight me more than an opportunity to show my utter contempt for the alleged ferocity of the 'gator by tackling him in his native element and riding him without saddle or bridle. 'That kind of talk's all right when th' aint no 'gators 'round,' remarked one individual, 'but I reckon if they was plenty of 'em out here in the creek you'd change yer tune.' 'Not much I wouldn't,' said I. 'Show me your alligator and I'll show you how to ride him.' Just then a small boy, breathless with excitement, rushed into the store with the information that there was a 'great big 'gator' in the basin near the wharf. About this time I began to smell a large-sized mouse, which savored strongly of a put up job. Here, however, was the longed-for opportunity, the chance to make good my boastful assertions, and there was no backing out without everlasting disgrace. So I announced my intention to ride the reptile forthwith. I buckled on my six-shooter, to be used, however, as I explained to the crowd, only in case of emergency, and sallied forth. Arriving at the wharf, I found about half of the population of the town present, the report having gotten abroad, in apparently annoying short time, that P. was going to ride the alligator.

"The tide had gone out and left the alligator landlocked in the basin, the water being from 2ft. to 2½ft. deep. I wasted no time in contemplating the scene or preparing a plan of attack, but started immediately for the brute, intending to get as close as possible without alarming him, and then, by a sudden rush, straddle him just behind his forelegs, and catching hold of them, pull them up over his back and await further developments, as I had no idea what he would do when he found himself in that predicament. I soon learned, however, that I had miscalculated either my own agility or that of the alligator, for he avoided my rush very cleverly, and got out of the way with surprising celerity. Again and again did I charge him, only to be baffled each time by the rapidity of his movements. I was in high glee, for although I had not yet succeeded in riding the animal, I was satisfied that I would do so eventually. I had entirely lost whatever of fear I might have felt on entering the water, and as I fondly imagined, had proved to the entire satisfaction of the crowd the cowardly and unresisting nature of the alligator. Our thrashing around in the water had stirred up the mud so that when the alligator lay quietly on the bottom only the dim outlines of his form could be distinguished. Approaching him cautiously during a brief resting spell, I succeeded in getting within a few feet of him, and with a sudden bound landed squarely astride his back and grabbed what I supposed were his forefeet, but which proved to be his hind ones.

"Then the interesting part of the performance began. Reaching his head around and bending his body like a cow's the reptile grabbed me by the thigh with his ponderous jaws, and, giving me a flirt, much as a terrier shakes a rat, threw me into the air to a height, as variously estimated by the spectators, at from ten to twenty feet. It seemed a hundred to me. When I first discovered my mistake in getting hold of the wrong end of the alligator, I involuntarily grabbed for my pistol, and had it in my hand when he threw me into the air. By some means it was discharged, and this gave rise to the report which was afterward circulated by some of the bystanders that I shot at the alligator as I was coming down. As soon as I struck the water on my return from my aerial trip, the alligator hit me with his tail and sent me spinning end over end for twenty feet, knocking the pistol out of my hand.

"When the melee first began some one had told a lad of fifteen, a warm friend of mine, that I was in trouble down at the wharf. Without stopping to inquire into the nature of the difficulty the boy rushed home for his gun, and reached the scene just as I rose blinded and bleeding from a dozen wounds after the alligator had struck me with his tail. The boy ran into the water and thrust the gun into my hands, and not a moment too soon, for the beast, now thoroughly aroused and angered, was rushing savagely upon me with his horrible jaws wide open, and would undoubtedly have crushed me into a jelly. I shoved the muzzle of the gun into his mouth, pulled the triggers, and then my strength and senses both forsook me, and I knew no more until I awoke several hours afterward in my bed, which I kept for three weeks.

"It must not be supposed that my friends among the

spectators stood quietly by and saw me about to be torn in pieces. None of them imagined any more than myself that there was any danger to me until after I had landed on the reptile's back, and from then until I fired the blue whistlers down his throat scarcely thirty seconds elapsed. My friends reached me just as I fainted and carried me out of reach of the alligator's dying struggles."

In conclusion I would say that if your readers could see as I have the frightful scar left on P.'s body from the wounds inflicted in his encounter with the 'gator, I have no doubt they would consider that he was justified in considerably modifying his estimate of an alligator's character. GUADALUPE.

VICTORIA, Tex.

225.

A FRIEND of mine was telling of rare sport hunting in Colorado.

"One day I was working my way up the Platte, with dog and gun, killing an occasional snipe and blue-winged teal, when I discovered two fine large ducks, feeding quietly near shore, some distance up stream and nearly opposite a mill. I called my dog in, made a short detour through a stubbborn thicket, came out in rather long shooting distance, fired one barrel, and got them both. They were beauties. Nice, tufted fellows, plump and very pretty in feathery sheen.

"Two men over at the mill called out lustily, cheering me at my good luck, it seemed; gesticulating and doubtless explaining to some one the capital shot I had made. The mill and the turbid river made a great noise, and of course I could not hear what they said. I only saw that they were very demonstrative and enthusiastic. 'Now, that's nice,' I thought. 'I will go over and present the ducks to them, and they will have a feast—ducks recently in from the rice fields of the South, rare ones, too, fat and juicy, on their way to the Arctic regions; something that people seldom get, and no doubt much superior to canvasbacks or mallards, or any of the high-priced articles.'

"You know true sportsmen are real generous with their game, as free-handed as millionaires, a great deal more so than common millionaires. They would much rather give a large fish, or a nice mess of game, to friends, to those who appreciate skill and opulent generosity than to have it themselves. There's nothing mean in the composition of the genuine sportsman.

"Well, I went way up the river to a fording place, and returned, ducks in hand, to the mill, holding the ducks up admiringly as I approached.

"'Those are fancy ducks,' exclaimed one of the men, not appearing hilarious, but quite in earnest.

"'Splendid,' I said, still holding them so that their plump forms and iridescent hues would show well.

"'Yes; I gave two dollars apiece for them last week—sent to St. Louis for them.'

"I can tell you one thing," said my friend after a pensive pause, "Such sudden changes are'nt good for a person. To come down from the genial sunlight of exultation into the dark and grimy valley of humiliation in one sad second, and come down hard, is trying on the nerves, and suicide beckons you pleasantly into a region of forgetfulness." EXPERIENCE WITH THE BIRDS.

DRIVING up I accosted the Domine, "Dan, I've been all over the scene of your old exploits. That swamp near Maston's house is turned into a noble bed of onions and cabbages; the swamp where I used to keep a tame woodcock to practice on is all in grass, and what with wet weather and moulting and migration I cannot find a woodcock. The game has nearly all gone. Bluejays and robins hold carnival in all our shooting grounds, but the shooting is played out. By-the-by, I met a chum of mine the other day, and he had been coon hunting and the coon tumbled out of the tree plump on his back, and hung to him like grim death. He had work to shake him off."

"Clarence ketched one in a twitchup some years ago, Captain, and a partridge in a trap baited for rabbits. Did I ever tell you of my going coon hunting out back on the farm? Silas had one of these old flintlock muskets, and off we and the dogs started. It was a good night to go cooning, and when we got out by the old cornfield the dogs ran a coon and treed him up in an old maple. Sile says, 'I see the critter;' and he tried to get the old gun off, but she sorter flashed in the pan. 'Look a-here,' I says, 'give me the gun.' So I took and primed her all O. K. 'Where's your coon?' 'Up there in the forks of the tree.' Sure enough I saw him, and he was an old settler. So I says, 'Sile, you take this here match, and when I give the word to fire, you just touch her off.' I pointed her. 'Ready, Sile; fire,' and he just touched her off. Down come that old coon, the dogs pitched on to him, and you bet there was a lively fight; but we got the coon. You were down in Virginia after the war, weren't you?"

"Yes, the Gov'nor sent for me, and told me I want you to go down to Virginia! When? Right away. That was as good as a marching order, and two days afterward I was on my way down there to take charge of a plantation of six hundred acres. The war had just closed; I had no time to think of dog or gun. Parties meant business, and there I was. I had hardly got down there before one day walking round I came on a flock of quail. How the little fellows did excite me. I said to the overseer of the quarry, what have you got in the way of a gun, and he showed me an old Harper's Ferry musket; looked like an old friend. Kick's no name for it; when you drilled your men with them at target exercise you could always tell whose guns went off, the men would spin round like a top. For a dog I had a bull-terrier, Jack; he could throw any cow on the place, and whip any dog within five miles, and was a first-rate watch dog; but he wasn't much on quail; he never had had much chance; there was no knowing how he might improve though! I knew I could depend on Jack making tall time round the thirty-acre lot, but the gun had to be tried. I loaded that musket very carefully with a charge of good strong blasting powder, five fingers, no scant measurement. If she stood that she would stand anything. I lashed the venerable relic, as I thought, securely to the top of an old gate, tied a long, strong piece of twine to the trigger, cocked her, lay down some ten yards off, and gave her a yank—Jack watching the proceedings with the greatest gravity. Dan, I wish you had been there to see the fun. With a mighty roar and plunge, that jerked the string out of my hand in a twinkling, cutting loose from her lashings with a whistle like a Whitworth shell, that old gun went up skyward end over end, heaven knows how high, up like a rocket and down like a stick. Jack gave one fearful howl and tore around as if the devil was after him. But the old gun was made of good stuff, there was no doubt about that, and I had no more fears of its bursting. I rummaged around and found some caps and good-sized shot, loaded up a second time scientifically, whistled for Jack and set out. I had a jolly tramp round that thirty-acre lot, and lugged the old fusil until I got tired. You should have seen Jack quarter his ground, head and tail up, at full speed, barking away. You would have thought there was a pack of hounds out. By and by, slap, dash he went through a bevy of quail. We all went off together; I pulled on sight and faith. I have an indistinct recollection of seeing a cloud of feathers float off as I spun round in a way that made my head swim. I think I blew one fellow into smithereens. That was the last I saw of the quail. Jack afterward fell into bad company, left quail for sheep, and paid the penalty therefor.

"Your shooting the coon with a musket put me in mind of the quail. But I tell you, old man, there was one morning's shooting down there I often think over. There were several old soldiers down there and my door stood always open; glad enough was I to welcome them under my roof and in peaceful contest talk over 'the wah.' Many a merry time we had 'way down in ol' Virginny.' I had a good double-barreled gun placed at my disposal, and one morning out in the barnyard I saw a lot of meadow larks flying around. So I walked back to the house and held a grand consultation with ol' Aunt Dilsey, the best cook in that part of the country. When she found I was somewhat of a Virginian we got along famously. 'I was raised down heah by Massa Jack, sah; I wasn't owned by no white trash, sah." Aunty was a mighty aristocratic old darky with her red bandana. I went up to the barn, loaded up and poked my gun through a chink in the side. Never mind, Domine, I was out on a lark. I let drive first one then t'other barrel, and I knocked over five; after awhile I blazed away again and so kept on until the birds got scarce, then I went out and picked up fifteen fine fat plump birds, toted them down to the house and handed them over to Aunt Dilsey. Then I sent over to Colonel S. and invited him to come over to my wigwam and have a lark, and I think he enjoyed the feast as much as I did."

"Curious how those quail will hold their scent. How do you account for it?"

"Well, they certainly retain their scent, Bogardus to the contrary notwithstanding, I think. The birds gets up and off like a flash, when he lights, he claps his wings against his sides and shuts off the scent. Then the only thing to do is to wait."

"Ever call them up?"

"Oh yes, but that's a rough way to kill them. I have seen it done, but I don't hanker after shooting them. A bird ought to have a chance for his life."

"You're right. Long ago I remember going out with Mr. S. You recollect him. He was a great friend of Mr. Frank Forrest's [Dan means Forester]; he had a good dog and was a good shot. We came on to a flock of quail, and drove them into a bog swamp, and followed them right up and found nary bird. I says to Mr. S., 'Hold on, let's go out and sit down awhile.' So we did, called off the dogs, and rested half an hour or more. Then we started to go back, and the dogs came to a point before we came to the swamp. Up got two quail, and I nailed them both, and Mr. S. got his bird. We went on, and I killed eight and Mr. S. got six, right in the swamp. Why, in Cudney's Swamp once I was coming through with your father, and we hadn't started nothing, and was a walking along, out comes old Flash and walks up to me, and looks me steadily in the face, then goes back into the swamp and begins to bark. 'The old dog must mean something, Domine,' and with that your father walks back, goes in and finds the old dog on a point, clucks to him, and up goes a woodcock, and your father kills him."

Blackie's pawing the ground, impatient for his dinner, so with a wave of my hand and a "Good day," I leave the Domine and drive home. CAPT. CLAYTON.

A CHANCE AT THE ANTELOPE.

SUSPENSION BRIDGE, N. Y.—For several years past it has been my good fortune to spend two weeks during the month of October with friends in Cass county, Nebraska, where I have always found excellent quail and chicken shooting, as well as some very good goose shooting. This season, being interested in a ranch up in the White River Valley, near Fort Robinson, I determined to try my luck among the antelope. I left Chicago over the old reliable Chicago & Northwestern Oct. 11, changing cars at Missouri Valley Junction for the Freemont, Elkhorn & Missouri Valley Railway and arrived at Crawford, Neb., Oct. 13. I was met at the depot by a hearty welcome from the smiling faces that have been absent for many a year and drove out to the "little sod shanty on the claim," where I remained for several days viewing the wonders of nature and drinking in the sweet pure air of northern Nebraska.

I found jack rabbits and ducks fairly plenty, and managed to amuse myself pleasantly for a few days, but where were the antelope? Only last season large bands could be seen within a mile of the house, now not even so much as a last year's track remained. So on Monday, Oct. 17, three of us started with team for Sheep Creek, Wyoming, distant about twenty-five miles. We took with us a good canvas tent, covered wagon and the necessaries for a ten days' stay. Charlie Smith, our genial guide, perfectly familiar with the route, led the way with the wagon, and I brought up the rear astride a well-trained Indian pony. Our route took us up along the White River valley to the head of White River, where we struck the old Laramie trail. We had not gone a hundred yards after striking this trail before I sighted my first antelope, and had an opportunity of testing my No. 3 long range Remington. It did its work finely at 350yds., and we secured a fine, fat doe without a loss of twenty minutes of time.

We camped that night near an extensive cattle ranch, known as No. 33 Ranch, and on the following day resumed our journey. When about ten miles south of the ranch we began to see plenty of antelope, and although they were very shy and hard to approach, we secured enough to gratify our ambition and keep us in fresh meat for some time. We were informed by some gentlemen at Sheep Creek that there were plenty of blacktail deer and quite a number of elk in the sand hills, ten miles from our camp, but as we were antelope hunting we did not go into the hills; and after spending a few days with the antelope we headed for home.

The morning we broke camp I sat on my pony and saw within a radius of one mile three large bands of antelope quietly feeding in the valley. It was a very pretty sight and one long to be remembered. Our trip was a very enjoyable one. I brought home several fine antelope heads which are being mounted and will soon ornament my office. Smith and Frank did the cooking; they are both good cooks, but season a little too high with sand for my taste, though under their care I find I gained about one pound a day, and I am sure I came home feeling well repaid for my trip and in better condition to cope with the trials of business for another year.

C. E. LEWIS.

PARK NOTES.

YELLOWSTONE NATIONAL PARK, Nov. 4.—*Editor Forest and Stream:* The affairs in the Park have settled down to their winter quiet. The last tourists for the year (two Swedish army officers) have left for Chicago. During the latter part of October we were visited by a cold wave, which ended in one very cold night for this time of the year, when the thermometer at the Mammoth Hot Springs registered 21° below zero. All the high mountains and table lands in the Park are covered with snow. The geyser basins and hot springs are comparatively free. The depth is not as great as it was last year at this time, when it was about 20in. The snow and cold snap started the game on their annual movement toward their winter range. A great many elk and blacktail deer have been seen lately by parties on scouting trips. Mountain sheep and antelope are seen on their usual winter range. No buffalo have been seen very lately in the Park. I hear it reported that a party of Englishmen killed three while out with one of the Ray Brothers from their ranch near Henry's Lake on a several weeks' hunt. The buffalo were killed, they say, on Warm Spring Creek. I hear of no recent violation of the game rules of the Park since the arrest of Frank Chatfield, whose horse, saddle and rifle were confiscated for his killing an elk in the southern part of the Park.

All work on the wagon roads ceased on Oct. 15, when the crews were paid off, the men leaving the Park to look for work elsewhere. There has been built during the summer 12¾ miles of new road, requiring the removal of a vast amount of timber for the roadway, which was cut 30ft. wide, with road graded up 18ft. wide, with ditches on each side. Six and one-half miles of road left uncomplete last season was finished. To make these roads required the building of two single truss bridges of 30ft. span each, across Obsidian Creek, 132 small bridges and culverts from 16ft. span down to smaller culverts of 3in. plank. The laying of 2,450ft. of corduroy 18ft. wide, covered with 18in. of dirt and gravel. Besides the new work done, repairs were made on the roads damaged by the melting snows, timber cut out after every wind storm, and 3,000ft. of saddle trail were made at the Grand Cañon. Lastly, all the unsightly, half burned log heaps, which have defaced the formation at the Midway Geyser Basin, were burned or removed.

About 5,350 days' work for men and 1,960 for teams were performed on the roads in the Park and $18,200 expended, about $6,200 of this sum was for repairs, there remains unexpended of the sum devoted to the Park $4,600 on which to resume work and repairs in the spring. The whole work reflects credit on Captain Sears, the engineer in charge, his superintendent and the workmen, who were in camps throughout the season. Very few men were injured, although several accidents happened, one man's arm was broken by a falling tree. Several men while asleep in their tents were shocked by lightning striking a tree under which their tents were pitched, those felt the shock worse whose beds were over where the roots ran through the ground. A sack containing giant powder was hanging in the tree at the time, the sack was set on fire and some of the sticks of powder were thrown 25ft. by the lightning, yet none exploded, otherwise several of the men would have been killed.

There is in the guard house at Camp Sheridan a man, James, who is held as a prisoner awaiting the action of the civil authorities; he is charged with being one of the parties who robbed the passengers on the coach between Gardiner and Hot Springs on night of the 4th of July, when they obtained about $17 and a few trinkets. A French gold coin led to his discovery as one of the "road agents." The other party implicated has not been arrested. What disposal will be made of the case it is impossible to tell, as there are no laws nor courts for the government of the Park. James will have to be tried before the U. S. Courts of Montana or Wyoming.

James is the party who was arrested for killing elk and trapping beaver in the Park at Norris last spring. His teams and other property were confiscated and he ejected from the Park. Later attempting to travel through the Park on his way from Gardiner to the Teton Basin he was again arrested and escorted out of the reservation with orders to keep out. How strong the evidence against him is for the coach robbery I could not learn, but it is supposed to be enough to convict. Your correspondent would be pleased to give the man who worked up the case and made all the discoveries leading to the arrest of James (and possibly the other robbers), credit for his share of the work, but has been requested by him not to do so.

The cabin in the Park on Hellroaring Creek which was used by a party of hunters last winter as their headquarters, while hunting for meat and specimens, has been burned, to prevent its use for like purposes again.

Cooke City, the mining camp near the northeast corner of the Park, is about deserted, only about fifteen people remain in the camp. H.

"SHADOW."—Williamsburg, Va., Nov. 5.—Have killed a few quail, and to-day we got a turkey, three of us. I had two long shots, but was not lucky enough to get one. Shall try them again Monday and start for High Point Tuesday.—SHADOW.

OLD GATES.

I DO not know how he came by that name, but he had borne it for several years and was well known by it to all the hunters of that region of country, when it was my good fortune to behold this gigantic specimen of the Virginia deer.

It was early in the winter of 1876, when Devinney, Frank and myself betook ourselves up into Laurel Ridge mountains in central Pennsylvania. There had come an unusually heavy fall of snow for the time of the year, and we had before arranged to meet when the first good tracking snow should come. So when the white flakes began to fall, the telegraph was put to work, and the arrangements soon made. When the noon train stopped at the little station where we were to leave the road for the mountain, three men arrayed in hunting rig alighted, to try for the first hunt of the season. We were so anxious to be under way that we did not wait to get dinner; but filling our pockets with crackers and cheese, we took a bee line for the "gap of rocks."

When we left the road and began the ascent of the mountain proper, we found it a trackless wilderness of snow, which was 18in. deep on the level, and when ascending the long steep stretches, it was more than 2ft. deep. You may judge the amount of labor it required on my part to get to the summit, which was one continual ascent, when I tell you that I had not walked three miles in any one day for a year. Frank was a long-legged, greyhound of a man, while Devinney was a hunter of thirty years experience. I did not say anything, but kept a stiff upper lip, and waded on, knowing that the struggle would not last forever, and if pluck would make up for deficiency of trained and hardened muscle, I would come out about as well as they did in the evening. After a long time some one called a halt to rest, and I was not that one.

We reached the summit and began the hunt. When we reached our stopping place for the night it was dark. We entered the house, and asked if we could get to stay all night. Besides ourselves, there were five other hunters in the house; but we stayed. When the supper was placed on the table, and I took a good survey of it, I thought I could easily eat everything there was on the table and then have room for more. But this was not the first time a hungry hunter's eyes were larger than his stomach; for when all eight of us had eaten all we wanted, and it was no small amount, there seemed to be enough for as many more.

The next morning we ate breakfast before daylight, and as soon as we could see, were on our way to see how the deer had passed the night. When near the summit of the range we saw an immense deer track. It was so large that it required close inspection to assure ourselves that it was a deer which had made it, and not a two-year old steer. As it was the largest deer track I had ever seen, I measured it, and found it to be 3¼in. wide. He had gone down the mountain, so we arranged that two should follow the track while the third one should watch the crossing on the other side of the ridge. We did this, and when half way down the mountain we jumped him out of a thicket. We did not see him, but we heard him going, and saw the proof of his immense power in the strides he made going up the steep and rocky ground.

When we came nearly up to where we had struck his track, we knew by his zigzag way that he was not badly frightened, and would lie down as soon as he had passed the ridge. We held a council of war to determine how to entrap him. We determined that Devinney, as the most experienced hunter, should take the track, while we should flank him on both sides. And all were to go slow, so as to find him in his bed. We followed this rule until we were near the summit, when Frank's anxiety to get the shot got the better of his senses, and I saw him begin to stretch those long legs of his. It was not long until I saw that he was so much ahead of the line, and was rushing up with so much noise, that the hunt was spoiled. So I swung around, as I was below them, so as to stay the deer if he attempted to go down the mountain. I had not much more than passed the ridge, where I could get a good outlook, when I heard them talking above me. I knew if he had stopped he would break cover when he heard them. I kept advancing cautiously, with my Winchester cocked and ready to fill his hide with lead if he came my way. In a few minutes I saw the glint of his back as it appeared above the logs as he was sneaking away, about a hundred yards below me. I just had time to get into an opening between two trees where there were no logs, and had no time to get a good sight even then, when with a burst of speed that I never saw equaled, he started for safer regions. As he flew past I pulled on him, but his speed was so terrific that I did not get there quick enough, and for that time I had lost my chance. But I had the satisfaction of knowing that I had seen and shot at Old Gates, the most noted deer on the whole range. Just where I had shot at him the ground was free of stones, and inclined in the direction in which he was going. We measured his tracks and found that many of his leaps cleared 30ft. at a bound, and I am sure his back was at no time more than 6ft. from the ground.

This was my first experience with him, but by no means my last. That deer fascinated all the hunters of the range, and we gloried in chasing him day after day, although we were so mad at him for the tricks he played on us and his persistency in leading us long and useless chases, seeming to take special delight in getting in our way on the coldest days, and in the roughest weather, and when we had followed him fifteen or twenty miles, with the thermometer twenty below zero, and at night be compelled to leave him in the same thicket from which we started him in the morning. What a cunning old rascal he was. Years of experience had made him very wise. He seemed actually to delight in being chased, and in laughing to himself as he reached home safely at night, that another hunter could boast of having shot at him, while he could tell the younger generation how many hundred bullets had whistled harmlessly past him. We judged him to be seven years old when I first saw him, and for the next ten years I either saw him or his track. Every hunter in the mountain had had a shot at him at some time, and several of us had sent the hot lead after him many times, but he seemed to lead a charmed life. Hundreds of deer were killed around him, but he went unharmed. I never knew any hunter who had the hardihood to claim that he had ever drawn blood on him.

I shall never forget one exceptionally cold day when he led two of us a chase. We started him in the morning. He dodged us and took the extreme edge of the mountain where it broke away into a valley, and keeping the ragged edge, where a goat would have thought twice before venturing, knowing that we would not look for him there, he passed us, went down through a deep hollow at a rattling pace and up the face of another mountain. Here he lay down behind a bush on a bald point, where he could see and laugh at us as we toiled along over the rocks, in danger of breaking our necks, for two miles. He waited there until we were within 200yds. of him, when he showed us his white flag and was off for the wilderness.

We followed for about a mile when we suddenly came to the end of the track. We took the back track and found where he had jumped off to one side and actually lay within 30yds. of us when we passed. When he saw us turn back he commenced breaking brush in another direction. He played us that way for half a day, and do what we would, he would have some new trick for the next turn. We shot at his flag several times, but when the bullet got there he was somewhere else. In the midst of our twisting and turning after him a mountain fog came down on us and we were lost. As we hunted our way out I thought several times I could hear his footsteps as he followed us, and his laugh as the hunters were hunted. Thus he lived among the mountain summits during the ten years that I knew him.

One cold morning in the winter of 1886 a hunter who had often shot at him, and who had boasted that he would some day bring him in, was out on the Five Points watching. Old Gates had been out late the night before, and as he was leisurely making his way home, thinking of his latest escape, when he came unwittingly in sight of the hunter. The long-wished-for opportunity had come. The long rifle barrel came steadily into line, the trigger was pressed, the bullet sped true to the aim, and the rifle which had always been true when aimed at other game, but false when turned against this old monarch, was true to its duty, and Old Gates sunk in his tracks and poured out his royal blood on the mountain top he had loved so well. When he was brought in the hunter was very much elated over his success, but as we looked upon that mighty form every one felt as if he had lost a friend. From that time hunting on that range had lost half its charm. We looked in vain for the giant's foot-mark, but it was gone forever. How appropriate that he should meet his death amid the high solitudes of the mountain summits where he had held successful lordship against all claimants for seventeen years! How glad we were that he did not meet the end through lingering wounds, but was permitted to sink down without a struggle and yield up his glorious life, and die as a king dies.

CLEVELAND, Ohio. HOMERUS.

BRUIN FINDS A CHAMPION.

SALEM, Mass.—*Editor Forest and Stream:* In your last issue you intimate that the New England and Canadian black bear is not the savage creature we have all been taught to believe him. I think you are mistaken in your estimate if you infer from the new style of newspaper stories that bruin has lost his brutishness. The black bear of Maine is to-day the black bear of yesterday, not a bit milder of disposition nor weaker of limb nor shorter of claw. Here are two reports to substantiate my view of the case, both from a Maine paper:

"Recently, an old man of eighty years, living at East Sullivan, who had been troubled for some time by the depredations of a bear, set a spring gun for him. Going to the trap, Sunday, he found the bear wounded. Attempting to despatch him, the bear attacked him and knocked him down, clawing his head and tearing the flesh badly. A neighbor came to his assistance, and with an axe attempted to kill the bear, which was still on the prostrate man. The handle of the axe being broken, he failed to kill him, and then loaded a gun and shot him and extricated the old man from his unlucky predicament. He was found to be badly hurt and it was necessary to take twenty stitches in dressing his wounds. The bear weighed three hundred pounds."

"Mr. John R. Sullivan and two other young men of Whitneyville, went up to Fletcher Brook last week on a hunting cruise, and while they went separately in different directions, Sullivan came up to four bears, two old and two young ones. The young ones ran up a tree, while one of the old ones stood up and showed fight. Sullivan (having a repeating rifle) fired and hit him. The bear was about 30yds. off, and made at Sullivan upon the jump; he kept firing at him until he was close up, and the fourth ball dropped him at the muzzle of the rifle. The bear was a large old customer, had lost part of a paw in a trap some time ago. The other bears let him alone, and as he had had a fearful time with old bruin, he did not care to follow them. This one was 7ft. long from his nose to the root of his tail; had some battles before, as a charge of buckshot was found under the skin of the head, which had completely healed over."

As a sequel to the first paragraph comes the news that the man, Simon Harvey, died of the wounds received in the scrimmage; and the weight of the bear has been run up to 400lbs. And here is a letter written to me by one of my brothers in Maine:

ROXBURY, Me., Oct. 2.—Yesterday I went up to my traps, and found one gone, hook and line; the bear went some five rods and snagged up, but tore the small tree all into slivers and went on. After this I was surprised to see how little trail the bear left. There were large ledges that she went over. The ground was very dry and the new leaves had fallen some after the bear had gone. At last I gave up for the first time and went home for Prince. The ground was so dry and it had been so long that I had but little hope that Prince could help me. When I got home Elder York was just driving away, but when he heard the news he put up his horse and went with us. We went up to the place and turned Prince loose; he knew what was up; he did not run off after rabbits, but would circle around and come back and start out anew. With the help of Elder York I ran the trail away from the ledges into the woods and followed it with great difficulty and very slow. Prince kept beating the woods ahead; bye and bye he did not come back, and after a while we heard that welcome and longed for sound. Prince had opened, and the great woods resounded with his angry barking. He was a long way off, but the day was so still we could hear. Elder York thought best to stick to the trail, but I did not fear to trust Prince, so we rushed on pell mell, and after a long race came to Prince and the bear. She was solid at last. We soon saw why she did not leave more trail; she had eaten the clog nearly all away; what was left was about like a stick of stove wood. She had but one forefoot, and that was in the trap. Prince was furious; he would snap her right in the side of her head time after time. I cleared her and let her go. Any one who believes that a bear cannot run down hill ought to have been there, she went down the hill as fast as a man could run. It was a mixture of bear, leaves and the dog. Prince would fetch her up, but she would rush on again at once. Soon Prince cried out with pain; she had bitten him, but he stuck to her. Elder York feared we should lose her, it was such a terrible scrimmage, and said if I could shoot the bear and not hurt the dog I had better do so. I got the little rifle ready and ran on. She soon landed on her back in the hollow, and on the instant I sent a bullet through her. It struck between her forelegs and went out of her back, making a big hole and tearing one lung. She up and off as though nothing had been done, but after a short run began to falter a little, so that the Elder struck her in the head with the axe; when he struck her the third time she went down and the big knife ended her.

Prince was proud it was easy to see, as he stood by the bear with me patting him on the back. Prince is set up higher than ever, he is getting so desperate I fear he will be killed by some bear. There is no trouble now in having a terrible time if we can find a bear track. The bear had cubs, she had already begun to eat beech nuts. I have lost seven sheep and lambs. She was raising her cubs on fresh lamb. Daniel Annis, Millsfield, N. H., has a hound that will hang on a bear three days and nights—has done it. We found it a hard case for one desperate dog to stop a large bear, even if she had no forefeet. Prince would probably put a yearling up a tree alone. I took the foot off from this bear sevaral years ago when she was a cub, and was being raised on my sheep just as she was raising her cubs this year. SILAS.

MARYLAND DUCKS.

TUESDAY was the first day for duck shooting on the Susquehanna under the Maryland law. The season begins Nov. 1 and lasts till April 1, but shooting can be done only on Mondays, Wednesdays and Fridays. The fall season for bluewing teals starts Aug. 15 and lasts till Oct. 1, during which no license is required. Within these limits black ducks, a few sprigtails and baldpates are shot; but it is no such sport as is enjoyed during the regular season.

The ducking fields on the Susquehanna River are known and talked about all over the United States where sportsmen live, and are probably the finest in the world. Ducks are found in abundance in other tributaries of the Chesapeake, in Albemarle and Pamlico sounds, in North Carolina, in Florida, in tributaries to the Gulf of Mexico, and in many other bodies of water, but they have no such flavor of the canvasbacks, black and blue heads that feed on the flats at the mouth of the Susquehanna River. The flavor is due to the peculiar diet upon which they feed. This is the wild celery. The ducking fields of the Susquehanna are sharply limited by statute. The northern line begins at the lighthouse on the shore, in front of the town of Havre de Grace, on the Harford county side, runs across to Carpenter's Point, on the Cecil county side, and the southern line is from Turkey Point, on the Cecil side to a spot half a mile north of Locust Point, and thence along Spesutia Island shore, keeping everywhere a quarter of a mile from the beach and the adjacent mainland, till the shore at or near Oakington is reached. The line thence runs along the shore to the starting point at the lighthouse. Gunners must keep strictly a quarter of a mile out. The distance from the north to the south line is probably four miles, and between the eastern and western limits about six miles. This embraces a large area of the finest feeding grounds for ducks on this continent. The best part of the shore is on the Cecil side. The celery is thick there and the ducks are not disturbed by the noises from the towns, though they do not have much rest from gunners on the legal days.

The wild celery is the wild duck's daintiest food. They will leave any other feeding ground and come to the Susquehanna shore. The water in which it grows is fresh, or very slightly brackish. Below Spesutia Island the water is saltish, and the ducks do not feed there in great numbers. This wild celery is a long ribbon grass, which grows so thick in summer that sometimes with difficulty a boat can be forced through it. It takes root in the mud, and its top comes to the surface of the water with the tide. In winter the top dies and is carried off in masses. The white, toothsome root, about 4 or 5in. long, is what the wild duck searches for. He dives for it, and feeds upon it with the greatest delight. It resembles somewhat fine wire grass. The peculiar character of the bottom, enriched as it is by the constant washing down of the fertile soil of Cecil and Harford, and the fresh water makes it grow in great abundance and gives it its peculiar taste. The grass does not grow to any extent below Spesutia Island. Ducks that feed in salt water, on fish and other food, are never of as good flavor nor as fat as those which get their living from fresh bottom. Old residents, who study closely everything connected with these shores, say the wild celery seems as thick here as ever—if anything, thicker. At the beginning of the season, before the high winds and tides have taken it off, it is not uncommon for the decoy ducks to get full of it, or "grassed," as the gunners say, which causes trouble. The shore, however, is getting more and more shoal, and it is feared that in from 10 to 15 years the gunning field will be decreased by at least one-half.

No gunner is allowed to cross the gunning line before 5 A. M. If he does he has to pay $25 fine and it may be forfeit his outfit. Rich and enthusiastic gunners from the cities sometimes pay the fine in order to continue the sport. Counting in all the shooters from both counties, about 250 licenses are issued yearly. At the opening of the season canvasbacks bring on an average $2 a pair, redheads 75 cents to $1 and blackheads 50 cents a pair.

The best shooting is on the opening day. The ducks are not frightened and can be more easily approached, and every gunner, having been eager for months to get a shot, goes to work in earnest. The best record ever made in these fields was about eight years ago, when on the opening day, William Dobson, of Havre de Grace, an expert gunner, killed from a box 540 and burst a fine gun before he stopped. He kept two men busy all day picking up dead ducks. The second gun got at times too hot

to hold. Ten or fifteen years ago 15,000 were killed in a day's shooting. In an average season there are here about 50 boxes and 150 bushwackers. The capital invested in the business is from $75,000 to $100,000. This includes boats, decoys, boxes, guns, etc. From 25,000 to 35,000 ducks have been killed in a season in latter years. They are sold everywhere. The best prices are given in New York, Washington, Boston, Baltimore and Philadelphia. No wildfowl can equal in flavor a Susquehanna canvasback duck.

From 3,000 to 5,000 were slain by all the gunners today. The varieties are black and redheads and canvasbacks. For some time past the ducking yachts, which their owners use here every season, have been preparing for the gunners. Among those here now, with their owners, are the Susquehanna, owned by Mr. Moore, of New York, of the firm of Tiffany & Co.; Reckless, owned by H. D. Polhemus and J. H. Demot, of New York; the sloop Carrie, belonging to J. G. Watmaugh, of Philadelphia; the yacht Carrie, owned by A. Hamilton, Col. Wagstaff and others, of New York; J. A. Russell, property of Messrs. Freshmuth, Green, Dando and others, of Philadelphia; C. W. Middleton's yacht Evadne, of Philadelphia; the yacht Widgeon, of Philadelphia; W. D. Winsor's yacht Lillie, Joseph Stickney's steam yacht from New York. The latter is 171ft. long. There are also the steam yacht Canvas Back, from New Jersey; Elsie, Rough Ashler, and others. These yachts are fitted and furnished in the most lavish style. The Susquehanna's cabin work, all of mahogany, cost $2,200. She is worth $6,000. The owners bring their friends with them, and when not shooting pass their time in comfort aboard their beautiful floating houses. They bring along servants, cooks, etc., and enjoy the good things of life. When the ducks leave here on account of the ice they not infrequently follow them south. Card playing, telling fish stories, and other amusements are common.

Gunners this year complain a good deal about the way ducks are being caught by trammel nets. These nets are made of three nets, one with an inch and a quarter mesh, between two made of large meshes. They are made slack and, weighted, drift with the tide. The owners say they set them in deep water for fish. The ducks dive for the celery, strike the net, force the bill through the big meshes, and become entangled in the small ones inside and are drowned. The owners say they are after fish, and if the ducks get in they are not to blame. Others say that the nets are constructed specially to catch ducks in. When the Legislature meets, this matter will be brought before it.—*Baltimore American, Nov. 3.*

CONNECTICUT COMPLICATIONS.

HARTFORD, Nov. 2.—*Editor Forest and Stream:* I inclose a slip from the *Hartford Courant* of to-day, and I beg for a careful reading of the same:

H. H. Hewitt and his clerk, H. S. Elmer, were before the police court yesterday charged with selling snared partridges. Mr. Hewitt keeps the Litchfield county market at 561 Main street. Mr. A. C. Collins, the game warden, testified that he tried to buy a partridge there last Thursday that appeared to have been snared, and that Hewitt started to take it out for him but then refused. Mr. Collins saw seven birds in the bunch and was certain they had not been shot. Then a partridge was produced that was bought of the clerk Elmer the same day by Mr. N. Wallace. Mr. Wallace testified that he asked for birds that had not been shot and that Elmer said they had some snared birds, but had to be careful about selling them. Mr. Hewitt said that when Mr. Collins said the bird he asked for was snared, he refused to sell it for that reason. He also said that the birds in the bunch were afterward dressed and appeared to have been shot. Mr. Elmer denied that when he sold the bird to Mr. Wallace anything was said about the birds being snared. On this point there seems to be a question of veracity. The fun of the trial was in some of the other evidence. There was the bird, showing no marks of shot, but having a mark round the neck just such as would be made by the noose of the snare. One man testified that partridges died in a queer way. He was out the other day and fired at two birds, each of which was brought in by his dog, but had no shot marks. The birds fell when he fired. Whether they were scared to death he did not say. There was also testimony that partridges were accustomed to dash themselves against trees and break their necks or die of the concussion. A following witness clinched this by testifying that he also knew that they died in this way of oxcussion. It was also testified by J. D. Thompson of Coventry, that when his dog brought in a wounded bird he killed it by biting its neck. He added that everybody did so—which will be news to several worthy sportsmen. This evidence was apparently intended to account for the ring round the neck of the bird in court. If it were killed in that way, however, the man who got it must have taken the whole head in his mouth, and then turned the bird around so as to bite equally on every side of the neck. There was more highly instructive talk of the same kind. Judge White held that the burden of proof lay with the State, that there remained a doubt, and therefore discharged the accused.

You will note that the defense attempted to show that partridges (ruffed grouse) are sometimes killed by "oxcussion" or "excussion." This must be a very fatal disease, for the bird that I produced in court had the usual markings of a bird that had been snared. It may be news to the sportsmen of Connecticut that the lordly grouse has another enemy not mentioned by any living writer, viz., "oxcussion" or "excussion." Will some of the readers of FOREST AND STREAM enlighten an uneducated public so that this disease will not annihilate this king of game birds? If discussion or percussion should attack the grouse we might have a stringent law framed.

In your issue of Oct. 20 I said "any sportsman in this State that wishes to coöperate with me in trying to enforce our game laws kindly write me." My mail has not increased to any great extent since that date. That is right, gentlemen, sit down. The laws will enforce themselves, self-acting, as it were.

Thompson, of Coventry, Conn., testified that he went out a few days ago and got four partridges; he shot two and his dog caught two without a sign of a shot mark on them. He said he paid $20 for the dog and he (the dog) was a red Irish. I hope the owners of Elcho, Messrs Wenzel, Pierce, Roberts, Dunphy, will pardon me for speaking of the wonderful speed of this dog. Thompson chews the neck of such partridges, and the result of such work produces the same marking that a snare would. I was laughed at by the learned counsel who defended the party because I had never seen a partridge when frightened dash against a tree and kill himself or drop when I fired without a shot hitting the bird. I replied that "I would have larger bags if such were the case. The owner of the dashing red said he used a muzzleloading gun and he did not mention whether the dog was muzzleloading or if he was trained by "Training vs. Breaking," and I should presume he was not.

No doubt the gentleman from Coventry has never read of "The One-eyed Grouse of Maple Run" by the pen of genial "Shadow." The above person also said that he "shoots" three months in the year and has snared birds, also admitted that he owns no land.

We may, if we have another snaring case, convict, provided we have the section of the earth where the bird was snared and a rod or two of hedge with well defined tracks of the snared bird and the party who snared the bird who has never lost sight of the bird until sold, and can identify the same in court.

A. C. COLLINS, Game Warden.

Editor Forest and Stream:

I was much interested in an article by "Wiseacre," where he said that information was given him by a prominent market man that the gist of the woodcock came from Connecuticut. This I can verify, for I have just returned from a week's hunting trip to Colchester, Conn., and I am a informed by a credible witness that from 25 to 45 each of woodcock and ruffed grouse are shipped daily from this town via stage to Norwich and so to New York. The birds are almost all snared.

I found no difficulty with the owners of property as to shooting, for though everybody has some grievance, when talked pleasantly with a minute or two and they see that you are a gentleman and will do the fences no harm, they will allow you to shoot at will.

The great trouble seems to be that the boys in the pursuit of hares tear down much fence, and this is laid on the shooter. Now the market hunter shoots nothing but woodcock and grouse, for quail and rabbits do not pay enough to bother about; and few city sportsmen care to carry a load of rabbits around, and few want the confounded things at all.

Towns on the Connecticut River still ship via the Connecticut River Steamboat Company, through the connivance of the baggage masters, some game which is disposed of in New York by the baggage master, who makes his returns at a very much lower figure than actual sales to his boy snarers along the route.

Of the Connecticut game I found few or no quail; plenty of woodcock, the best of the flight birds had hardly come as yet, but good picking was to be had among the birches, and there were lots of grouse, though the sportsman who wants grouse needs a splendid dog, a good gun, lots of patience to boot, and he must know how to shoot, for a well-put-up grouse is harder to hit than a streak of chain lightning. ELK.

CAPE COD QUAIL.

A WEEK with the quail, a week full of glorious sport from sunrise to sunset. Once more we have enjoyed the long tramps over the old fields, through the clear cool air of the pleasant October days. Once again we have followed our trusty dogs to old familiar spots, where we nearly always find our favorites.

The 15th of October dawned clear and cool with the wind blowing fresh from the northwest, just the right kind of a day to make one feel like walking. A hunt over our old grounds disclosed as many coveys as usual, but of much smaller size than I ever saw them before at this season of the year; in fact, every season of late years quail seem to be smaller and smaller on the 15th of October, and this season they were exceedingly small. I need not hesitate to say, and it is corroborated by reports from different parts of the cape, that one-half of the quail were unfit to shoot at that time, not being more than two-thirds grown. Out of seven coveys found Oct. 20, two were so small that they could hardly fly and one was without old birds, which had been shot. One covey contained two different sized birds, part of which were about two-thirds grown and part just able to fly. The next day, the 21st, we had a severe rain storm, which cleared away that afternoon with a cold wind from the northwest, which doubtless proved fatal to most of the very small quail. The law ought not to be taken off of quail down here until Nov. 1. Many gunners, if the young quail in a covey are too small to shoot, kill the two old birds, leaving the young to perish, as they generally do in the cold nights of October without old bird to cover them. I have not heard of any large bags being made, a bag of 10 or 15 birds to two men in a day is considered a fair number.

The quail of late years seem to keep close to the small swamps and pines, where in years past they used to be found quite frequently in the old fields about the bayberry bushes. Your correspondent and two others left the house at 12:30 P. M., found seven coveys of quail, shot 18 and were back at the house at 5:30 P. M., having covered about four miles of ground. This was not a large bag considering the number of birds found, but they were in bad places, and one of the coveys put down in a cedar swamp into which we did not follow. The most pleasure was in seeing the dogs work, the three pointers, father, mother and son, pointing side by side the same quail, which they did several times in succession.

Ruffed grouse are more plentiful than usual this season; for a number of years this bird decreased for some reason that no one can tell, but I am pleased to learn that they are on the increase at present. CHESTER.

HARWICH, Mass., Oct. 29.

DUCKS IN GARDINER'S BAY.—Sag Harbor, N. Y., Oct. 26.—*Editor Forest and Stream:* Last winter our Legislature modified the law so that ducks can be chased down by steamers in Gardiner's and Peconic bays. Now, would a practiced gunner be seen on a steam yacht about every day in the week chasing ducks and scaring them to death?—for I think that is the way they get the most they do get. There is one yacht which has made this a regular business ever since the first ducks made their appearance, and I am told the owner was the principal man to get the act through the Legislature. He is about the only one that makes a business of it. We used to have fine beach shooting before that practice commenced, but there is none now. The ducks are driven from their feeding grounds and are now setting over in the ocean, tens of thousand of them, all the way from Fire Island to Montauk Point, because they are not permitted to stay on their old haunts. The yacht I speak of was just as busy last year, when its owner knew he was violating the law, and cared nothing for it. The gentleman who said the game laws are made for pot-hunters was sound; people who have more money than principle can do as they please and have the laws all made to suit themselves. It is too bad that good shooting should be spoiled by one or two who care for no one but themselves. I say give the birds a chance for their lives, and if they get away, let them go; but let us try by hard work to allow Gardiner's Bay and Peconic Bay birds to have an equal chance with those of the other waters of our State.—SOUTH HAMPTON.

DEER AND QUAIL.

ON Monday, the 24th inst. (October), a party of several persons went to a point about twelve miles north of this place, well prepared with dogs and guns, to see if they could get a good store of venison. The week previous had been quite rainy and they hoped they might have several days of fair weather. In such case no doubt existed that several deer would be their reward for all the trouble which they might undergo. They started out from their rendezvous at an early hour on Monday and succeeded in starting, but the animal was so lucky as to take a route in which none of the expectant sportsmen had taken a stand. During the drive a fine gobbler was killed. Soon after this the darkened sky, tired of its load, began to drop it on the earth, and by night, when they returned to camp, a warm fire and a change of clothes became necessary as well as comfortable. I reached the place about 1 o'clock, just as the rain began to fall, and concluding that wisdom required that I should avail myself of the shelter which the roof afforded, I remained within doors, communing with my friend Mud as he sat in front of a crackling fire made of dry blackjack wood.

On the way my untireable dog Argo, albeit fat enough to make excellent French sausages, in his range set a covey of birds in the corner of a field. I could not resist the temptation, and getting out my 14-bore choke (one of the nicest guns I ever saw) I requested Mud to hold the reins of our Bucephalus while I made a trial of my skill. The dog held his point most staunchly, and when I got within a few yards of him I ordered him on. At the spring a covey arose, and selecting one I gave him the right barrel, making a nice kill. At the report of the gun another got up, and I knocked it over. The others having taken thick cover, I did not choose to pursue. The birds were not grown. In fact a majority of the coveys are too small for sport.

It rained all the while the sportsmen remained on their hunt, and, in consequence thereof, nothing was done. Some of them had gone after opossums (I write it thus to show my orthographical knowledge) on Monday night, and had caught four nice fat ones. These, the gobbler, and the provisions they had brought from home, served to give them some excellent feasting.

One of the party is a great sufferer from that annoying trouble called hay fever. He had spent three days at the place during the past summer, and had been greatly relieved. The first night he did not sleep well; but all the others he was free from his trouble. If he had remained a fortnight during the summer, I think he could have bridged the chasm. There is little doubt as I think, that the water from the spring, which is a combination of sulphur, iron and sodium, will do any one troubled with hay fever a great deal of good. When the warm weather returns a number of persons mean to try its virtues.

During the present week I think of going up to Mountain Creek to see if there are any birds large enough to shoot. You shall be advised of the result. WELLS.

ROCKINGHAM, N. C., Oct. 31.

AVIS DIFFICILIS.

BANGS is a poet. Bangs would be a sportsman. Quoth Bangs: "'Tis the mellow autumn time. 'Tis the falling of the year. 'Tis the time when the poet and the sportsman should be abroad. I will hie me to the forests—to the haunts of the wary pheasant!"

The poet's soul is in sweet harmony with the occasion and the surroundings. As he warily approaches "the cover," his lips murmur this challenge to his expectant prize:

"O bird,
With plumage iridescent!
Beautcous pheasant!
I come in sport to slay thee,
With shot and shell to stay thee,
Wild bird!

"Yes, bird,
To dine upon most pleasant!
Delicious pheasant!
This hammerless I carry
Shall indite thine obituary,
Game bird."

Sounds heard. Whir-r-r-r-r——Bang! BANGS *loquitur.*

"O bird,
With spirit effervescent!
Sudden pheasant!
You caught me not quite ready,
My aim somewhat unsteady,
Quick bird!"

Bangs marks down his victim behind a log in the distance. Softly he approaches the spot and finds it—not there. As he turns disappointed away, he is constrained thus to apostrophize the absent fowl:

"O bird,
With body evanescent!
Fleeting pheasant!
'Tis hard to slay thee—very,
I'll postpone thine obituary,
Live bird!"

THE DOMINE.

STEUBENVILLE, O., Nov. 1.

OUT OF ITS ELEMENT.—Augusta, Ga., Nov. 3.—On the 21st of October I took a day's outing on quail. I had a scattered covey along a dry ditch, and in hunting them my dog came to a point. On reaching him and while expecting a bird to rise, the dog gave a sudden jump and caught a coot, called "blue peter" with us. This is the strangest catch I ever made on high land. This bird always precedes ducks here, and is aquatic. He was not within three miles of water enough to swim in, and I can account for it being on high land in no other way than having dropped from exhaustion.—J. M. W.

A VOICE FROM THE ROCKIES.—"Alrands, Oct. 18.—In for supplies and then off for Grey Bull for sheep and bear; have had good sport; our score is now 23 head (elk, moose, blacktails and antelope). Have seven very fine elk heads, one for you. We have had a fine trip and pleasant weather. The Colonel and I are in prime condition. We are hunting on a range of mountains 9,000ft. high; a side step steady up, and a general slip and slide down soon takes the fat off.—Gov'nor." I will send you full particulars of the expedition on the return of the huntsmen. —CAPT. CLAYTON.

TESTING A GUN BARREL.

Editor Forest and Stream:

It has been frequently a matter of conjecture to me what amount of strain a gun would stand, and my desire for knowledge has been greatly stimulated by some writers in the sporting press who laud a certain gun and others also who condemn the same weapon. As far as I have seen no one in the United States has gone to the trouble and expense of finding the limit of strength in any make of gun, nor have I heard any mention of such an experiment on the other side of the water.

Now, I think I have solved the problem pretty fairly as far as one make and grade of gun is concerned. Having resolved to find out what a gun would stand, I selected the one of my two guns for which I had least use, a Parker 10-bore, weighing 9lbs. 13oz., full choke in both barrels, which were 32in. in length. The gun was bored specially for No. 6 shot and made an average of 190 each barrel with 1¼oz. Leroy No. 6 and 4½drs. FG, 30in. circle, 40yds. It was of the $70 grade and was bought from Read & Son, Boston, three years ago. The gun had not been fired more than 350 times, with ordinary loads, so that it was to all practical intents as good as new.

The powder used in the test was Orange FG, and the shot Tatham's No. 10 chilled; they were measured in the combined powder and shot measure made by the B. G. I. Co., and the measure was always struck off level with the top.

A rest was constructed to fire the gun from. The bed was a squared log and spiked upon its upper surface was a square block with a groove cut along its upper surface in which to lay the barrels, and a long heavy squared piece of timber with a groove cut down its face to receive the butt of the stock. Underneath the bed were placed two heavy pieces of timber to raise the bed off the ground. The gun was secured in the rest by two half-inch ropes, one of which passed with a double turn round the barrels at the point of the fore end and stretched back to a piece of wood nailed under the bed log to prevent the rope slipping forward. The other rope passed with a double turn around the pistol grip and stretched back was secured in the same way as the other. The ropes, when in position, were twisted up tight with a stick, tourniquet fashion. This held the gun fast and the ropes stretching back held the gun up against the rear block and prevented jumping.

The gun was fired by a thirty-yard cord attached to each trigger, and the barrels were wiped out three times after the second, fourth and eighth shots; this was to see if the gun was leading to any great extent.

In the experiment I fired a series of four shots (two from each barrel) of each different load, using only four shells, which I drew and recapped as required, the shells were Winchester 2¾ brass. The experiment was made Oct. 27 and the following were the loads and results:

In loading the gun I inserted a primed shell at the breech, closed the gun and poured the powder in at the muzzle, followed by a pink-edge wad, the shot and a wad of paper.

The loads used were 8drs. powder, 3oz. shot in each barrel for first series of two shots with each barrel; 9drs., 3½oz. for second series; 10drs., 4oz. for third series; 11drs., 4½oz. for fourth series; 12drs., 5oz. for fifth series; 13drs., 5½oz. for sixth series; 16drs., 7oz. for seventh series.

The first damage appeared at the third shot of the third series, when the stock split in two longitudinal cracks from the lock plates right through the grip. The grain of the wood ran in a line with the barrels, instead of in a line extending from end to end of the stock. I lashed the split stock, but the next shot broke it off, bent out the trigger guard and slightly bent the left trigger. As the trigger guard was in the way without the stock, I took it off, sawed off the broken end off the stock, and butted it against the rear block with a piece of wood under the locks to raise the triggers clear of the bed log. Things continued in this state till the third shot of the fourth series, except that each recoil drove the broken end of the stock about an inch into the rear block and jammed up the locks with broken splinters, which I had to stop and pick out. At this shot the cracked left trigger was bent and doubled up under the plate, and the upper strap or tang was bent down at the end. The next shot bent the tang still more, and bent in the rear end of the left lock plate.

On firing the first shot of the fifth series (the right barrel) the gun turned over and striking on the other trigger both barrels went off almost simultaneously, the result being that the bent left trigger was nipped off and the barrel therefore disabled. I always loaded both barrels at once and cocked both hammers at once; my object was to see if the explosion of one barrel would set off the other, as has happened to the guns of some of your correspondents, but this was the only occasion on which such a thing happened, and it would not have occurred had the gun not fallen upon the trigger. During the remainder of the experiment I was therefore confined to the right barrel.

No further damage occurred during the rest of the shooting till I reached the first shot of the seventh series, except that the gun turned over again and cracked and bent up the right trigger. I found it difficult to prevent the gun turning over at the shot after the loss of the stock. The load for the last shot was the trifle of 16drs. powder and 7oz. shot. This burst the barrel, making an aperture 5¾in. in length, commencing ¼in. behind the shoulder of the chamber, and extending in width from the edge of the upper rib nearly to the upper edge of the fore-end; a piece of brass shell was also blown out; the extension rib which was inserted 1¼in. within the barrels was intact, but the upper rib from that to within 5¾in. of the muzzle was ripped off and bent forward 2in. The fore-end lump was broken out and the under rib from that to within 13in. of the muzzle was torn away from the right barrel but still adhered to the left barrel. The space between the ribs was filled in with plaster of Paris, and this also was blown out; the right trigger was broken off, the left lock-plate bent in at the rear corner and bulged out in the middle, and the left barrel was bulged out quite perceptibly. The fore-end was a complete wreck, smashed into splinters, many of them small enough for toothpicks; the iron work was, however, intact.

Now as regards the frame and action, I could not see from a close examination that they showed any signs of strain, the action worked with perfect ease, the bolt locked and the barrels fitted as closely as when the gun was new; indeed the frame, action, extension rib, barrel lumps and the rear ends of the barrels could be put on another gun and no one know that they had been through such a trial, I think this says a good deal for the Parker action.

After examining the gun I shipped it to Parker Bros. with a report of the experiment and a request that they examine the gun thoroughly and let me know the result.

J. CAMPBELL.

THE GAME CAMPAIGN.

CENTRAL LAKE, Mich., Oct. 30.—Several gulls were seen yesterday, flying over the lake. They are, I believe, never seen here except when in attendance upon the annual school of "herrings," and it seems likely that these fish are working this way.

Our deer hunters are looking sadly at their rifles, and a very few of them intend to look for deer next Tuesday; but these animals are now so scarce that it seems hardly worth their while. Still, there are a few left.

It may be of interest to those of your readers who have visited this part of Michigan, to learn that the final survey of the D. C. & E. R. R., from Kalkaska to Mackinaw, has been completed. It passes through Central Lake village, about twenty rods west of Smith's old hotel, and there seems a reasonable probability that the road will be built.

KELPIE.

AUGUSTA, Ga., Nov. 2.—*Editor Forest and Stream:* The season has fairly opened for game, and the shooting is better than I have ever known, especially on ducks. Ten days ago a heavy rain set in with the wind from the northeast, and this brought the ducks in countless thousands, some remaining in the locality while the great bulk kept on toward the coast. On last Friday I walked to the river side, and saw drove after drove flying down the Savannah River. The rains continued nearly a week, and filled the lowland fields (clay soil) with water. Thousands of ducks have stopped in these to feed among the high weeds and grass, and the slaughter has been great. This style of shooting is peculiar for us, as in all my experience I have never had just such a one. I have been out three afternoons, only half a mile from the city, and have seen lots of ducks in the open grassy fields, and about dark they fly in from all directions to roost and feed. All the ducks I have seen are the large English ducks. Heretofore we have hunted the sloughs and water holes, but they seem to avoid these places and drop in the fields where there is water. Hunters report quail, woodcock and snipe in abundance, and I should judge the report correct from the quantity on sale. I have been out but once since the open season, and made a fair bag on quail—J. M. W.

WATERVILLE, Me., Nov. 6.—Kennebec county, although one of the longest settled portions of Maine and one containing many large towns, still offers fair sport to the hunter and the fisherman. One who is a skillful shot can get a good bag of ruffed grouse in almost any of the country towns. The numerous streams and ponds afford fairly good duck shooting in the fall and spring. The swamps abound with rabbits, and foxes are plenty, offering the best of fun to one possessing a good hound. Gray squirrels and raccoons are also found. As to fishing, trout are nearly a thing of the past, but the ponds and streams, in which the county abounds, are well stocked with pickerel, perch and black bass. The best fishing for bass is to be found in Lake Messalonskee and Lake Cobossecontee. Taking into consideration the fact that a sportsman may in this county hunt and fish where and almost when he wishes, one may go further and fare worse for sport than in old Kennebec.—E. T. W.

BOSTON, Mass., Nov. 5.—I have been off shooting several times and I have not for many years seen such a poor season for game as this. We did have one flight of marsh birds Aug. 20 to 24 (which was the best on the Cape for years), but the native woodcock were a dead failure almost everywhere in the eastern part of the State. Partridge are quite scarce, probably on account of the wet summer; and as for quail I don't believe there is one bevy where there were four last year. Some say they were winter killed; some say that they did not pair (there are a good many bevies of old birds found), but all agree that they are scarce, much more so than last year. The flight woodcock went by as usual, very quickly, but some gunners had quite good luck while it lasted; have heard of as high as fourteen in one day. I don't know for myself, as I was too busy at the time to try them.—J.

MASARDIS, Me., Nov. 2.—The hunting season has been unusually fine and a great amount of large game has been shot in this county. I have heard of six moose and about twenty deer and caribou. A few days since Sawyer and Greenough, fur hunters on Otter Brook, ten miles from Oxbow, shot two moose not far from camp. They went out after partridges to bait traps with and came upon three moose in a logging road. They allowed the third one to escape. The headwaters of the Aroostook are now the best big game preserve of easy access in the State, and would continue so were it not for skin butchers and lumbering operations. It was at this place a few years since that a party of Indian butchers, with over thirty moose hides in their possession, successfully resisted arrest by a game warden.—C.

DUTCHESS COUNTY, N. Y.—My first note gave rather a gloomy view of woodcock shooting, with my favorite setter off for the happy hunting grounds, a worthless dog palmed off on me, a gentle reminder of rheumatism, and no gun fired off for two seasons. It was high time to be up and doing: I sold doggy for what he would fetch, enlisted an old acquaintance, who furnished a good dog, while I threw in horse and wagon, loaded up and sailed in; hunted two weeks steadily "from morn till dewy eve," and we bagged nearly forty woodcock. I kept my end of the log up, as we took out these birds from three or four swamps not far away, we think we did well. My nephew had fine sport over in Ulster county bagging some 120 woodcock and partridges.—CAPT. CLAYTON.

HORNELLSVILLE, N. Y., Nov. 6.—Ruffed grouse were never so plentiful before; the Hornell Gun and Game Club takes care that the snarer does not get in his work. When we find a hedge we appoint a committee to watch it until we catch the fellow in the act of taking a snared bird, then it is pay the fine or go to jail. Our District Attorney Robinson will have no nonsense about the game laws. As a result of our watchfulness I report that E. Shear, of this place, killed in one day over two Irish setters twenty ruffed grouse.—J. OTIS FELLOWS.

AN EYE-OPENER FOR MOSSBACKS.—Grand Rapids, Mich., Nov. 3.—*Editor Forest and Stream:* The monthly report of Game Warden Wm. Alden Smith for month Sept. 27 to Oct. 26 reads thus: "There were twenty-nine arrests reported as follows: Dr. Wessinger, of Allegan county, not guilty; Chas. Kasiscka, Berrien county, fined $5 and costs; Henry Richards and Joseph Vizna, $10 each and costs; Lewis Gilbant, not guilty, all of Baraga county; I. F. Nelson, Delta county, fined $10 and costs; James A. Saunders, Genesee county, 25 days in jail; Frank Richardson and James Stanford, Baraga county, $5 each and costs; Ellsworth Bacon, Bert Bartholemew and Eugene Deane, Newaygo county, $5 each and costs; H. Sutton and C. Gregory, Jackson county, discontinued; John Banister, same county, $5 and costs; Steve Wichoock, $5 and forfeiture of net; William Tuch, $5 fine and costs; Adam Wichoock $25, Tonie Wichoock forfeiture of two nets, Stephen Wichoock suspended sentence, all of Manistee county; Chas. Joe and Chas. Jenneraux, of Mason county, adjourned 60 days; M. Taylor, David Wilson, Eber Stevens, John Leate, Montcalm county, $5 each and costs; Dan Mongoose, Marquette county, $25 and costs; Charles Comptingame, Menominee county, $50 and costs. A total of $200 in fines alone." This is a veritable eye-opener; it shows that Smith means business; and the Mossback is rubbing his eyes and asking himself what it all means.—ALPENA.

CHAMBER AND CHOKE.—Toronto, Can.—*Editor Forest and Stream:* I would be much obliged if some of your readers, who understand the matter, will say what is the use of the shoulder at the end of the chamber in breech-loading guns, in which the cartridge is inserted. I have a 12-bore breechloading doublebarrel gun, by a good English maker, which when it came into my possession kicked fearfully with a charge of 3drs. of powder. A clever, practical gunmaker here, to whom I took it, removed the shoulder at the end of the breech chamber, entirely curing the gun of kicking, and at the same time improving its shooting. It is now a regular cylinder, gradually narrowing to 12-gauge at the muzzle. Does not such a condition of the interior of the gun constitute a species of chokeboring, and does not the contraction at the muzzle delay the charge sufficiently to give the increased power of a regularly choked gun? Why should not all guns be bored in this way?—J. S. W.

A NEW YORK GAME LAW SYNOPSIS, suitable for posting, has been prepared under the direction of the Fish Commissioners, and may be had on application to the secretary, H. H. Thompson, 373 Cumberland street, Brooklyn.

AFTER ELECTION.—Baltimore, Md., Nov. 3.—I will go to Augusta county, Va., after our State election, and will write you from Buffalo Gap in reference to hunting in that region.—E. S. Y.

HE HAS A BONANZA.

DURHAM'S CREEK, N. C., Oct. 24.—*Editor Forest and Stream:* I take the liberty of writing to you in order to advise you of a plan whereby you may please your sporting friends, and at the same time afford yours truly a chance to turn an honest penny. It is this: I have about 4,000 acres of land down here that is literally alive with game of all sorts (except bear). The game consists of deer, wild turkey, quail, woodcock and snipe, rabbits, squirrels, coons, opossums, gray foxes and an occasional wildcat. The waterfowl on the Pamlico River are wild geese and swan, and all game ducks that are found on the Chesapeake. Fish and oysters can be had at all times through the winter. I have ample house room for 15 or 20 men, and would furnish deerhounds. Setter dogs are not to be had here. The land is posted, that is, protected by law from outside hunters. Forty-two head of deer were killed in here last winter from Jan. 1 to Feb. 15, besides many more that I had no account of. It is no uncommon thing to shoot from two to seven head on a favorable day.

My plan is to rent the land and house room to a club, they to do their own cooking, etc., or I would furnish good plain board, and keep their dogs at a reasonable rate. The ways of getting here are by O. D. S. S. line to Washington, N. C.; or Bay line to Norfolk, thence by Norfolk Southern Railway to Washington, N. C. From Washington down river by schooner or steam tug. Mail twice a week. Telegraph office at Washington, distant 25 miles.

In cold weather game can be sent to New York city in about 40 hours. I can refer you to the officers of the U. S. revenue cutter Stevens, to Lieut. Haun, Lieut. Hanks or Chief-Engineer Dinsmore. Hoping that you will hand this to some one who may think it worth while to work it up, and excuse the liberty I have taken, I remain, yours faithfully,

I. S. KITTLE.

THE CRITICS AND UNCLE LISHA.

"UNCLE LISHA'S SHOP" is meeting with a pleasant welcome among the reviewers. Here are some of the words of praise that have come to our notice:

Delightful as a fresh breeze over a meadow of new mown hay.—*Bay City Tribune.*

There is not a Vermonter in middle life, especially if he now lives at a distance from the old home nest, who will not continually laugh and cry over this picture of the past. * * * Many of the domestic and neighborhood scenes are full of tenderness.—*Rutland (Vt.) Herald.*

The Milwaukee *Sentinel* points out the "quaint humor" of the book; the Portland *Argus* pronounces it "a graphic picture of a rustic community;" the New York *Commercial Advertiser* calls it 'a photographic reproduction;" the Kennebec *Journal* recognizes Uncle Lisha as "a character;" the Grand Rapids *Eagle* praises its chapters as a series of short sketches, "and very good ones at that;" the St. Johns (N. B.) *Globe* says "the incidents are related often with dramatic effect." The Ann Arbor *Courier* thinks the volume "a first-rate one for a little relaxation from every day life."

The scene is in a nook of the mountains of Vermont where old ideas and the twang of centuries stick together like ancient comrades.—*Cincinnati Commercial Gazette.*

During several years past we read with great enjoyment in the columns of FOREST AND STREAM a series of humorous sketches, totally unlike anything of the kind that ever appeared elsewhere, and which for raciness and variety of homely incident, and for mastery of the genuine "down-East Yankee" and French Canadian dialects it would be impossible to surpass. These sketches are connected with sporting subjects, but can be enjoyed by any one,

as their humor is so quaint that it does not require a sportsman to appreciate the shrewdness and humor of Uncle Lisha, the gasconade of Antoine the Frenchman, the grave but funny wisdom of Sam Lovel, or the peculiar characteristics of the others who figure in the narrative. The publishers have done the public a service in publishing these delightful sketches in a neat and permanent form, and the book ought to have a large sale.—*Belleville (Ont.) Intelligencer.*

The book is a charming record of true observation, close sympathy with men and nature, and accurate representation of Yankee and French Canadian dialect. Since Uncle Remus appeared on something the same plan, nothing more original and amusing has been issued by any American writer.—*Toronto Globe.*

There's considerable fun to the square inch in some of the chapters, as the reader "listens" to the yarns. An occasional pathetic incident adds variety to the book, which on the whole is a very interesting one. Some of the characters are faithfully delineated, and the dialect is as broken as anybody could desire; very natural, especially, is the chopped talk of the Frenchman, "Antoine." The reader, as he lays the book down, will be inclined to regret the departure of 'Lisha and Jerushy and the closing of the shop.—*St. Albans Messenger.*

Faithful portraitures of Green Mountain characters, with indisputably correct dialect of Yankees and Canadians, the character representations being very felicitous. We have heard these papers very highly commended by people of cultivated literary tastes, and they are warmly praised by Senator Edmunds, Dr. Jed. H. Baxter, Purveyor General of the United States army, and others equally well qualified to judge of their merit.—*Montpelier Argus and Patriot, Sept. 21.*

A clever picture of Vermont country life. The humor of the book is of the quaint, dry sort which is associated with the word Yankee, and there is often a great deal of shrewdness mixed in with the fun.—*Detroit Sunday News.*

MINORITORIOUS AND MAJORITORIOUS CRITICS.

Portland Advertiser.

* * * Involves a good deal of overdrawn dialect, too exaggerated even for Yankee land. The use of expletives also, as here employed, is something to be dreaded. * * * There is an occasional "cute" remark, and here and there a fairly good sketch of character or description of out-of-door scenery; but *such* dialect, as witness this, at a town meeting:

* * * "that them as is in the minority will feel as content to be minoritorious as them 'at is in the may-jority will be to be majoritorious."

Hartford Courant.

A picture of rural Vermont where the primitive manners, speech and customs have been preserved by an isolation unviolated by the march of progress. Chapter 1, "The School Meeting in District 13," might have been written by Craddock, the humor is so rich and the dialect so faithfully rendered. The exhortation of the moderator is quotable enough to pass into proverb, when he hopes "that them 'at is in the mynority will feel as content to be minoritorious as them 'at is in the may-jority will be to be majoritorious."

Sea and River Fishing.

WHO CAUGHT THE BIG BASS?

A STONE thrown twice by a strong arm from the mouth of Little Otter out into Lake Champlain would fall on Rock Island. If thrown Aug. 15, 1887, or thereabouts it might also have created no little confusion in the peaceful camp of the Bass-Killers who, two days before, had spread their canvas under the few stunted wind-blown trees which huddled together on the highest part of the island.

The Bass-Killers, voyaging southward from Plattsburgh, N. Y., in the good yacht Dolphin, had sighted Thompson's Point at high noon of Saturday, the 13th inst. "Whither away?" was the next question. Nobody knew exactly where the mouth of the Little Otter was. Somewhere in the sweep of the wide extending bay, we knew the waters of that once famous trapping stream must add their sluggish volume to the lake; but to what point of the eastern horizon should the skipper point the Dolphin's prow? This all-important question was finally settled by sending the Pedagogue and the Reformed Grocer ashore in the tender to propound the problem to the cottagers on the point. In due time the seekers after definite information returned, the Pedagogue's pockets bulging with apples and the Reformed Grocer keeping watch and ward over a large apple pie transferred from its original plate to a piece of board. While the Pedagogue distributed his worm-eaten, but very welcome fruit, the Reformed Grocer waved his hand to the southeast, where the waters seemed to melt into the horizon with no intervening shore and exclaimed:

"Head 'er that way, Cheese'm!"

"Cheese'm" was the nautical member *par excellence* of the party. His rightful designation was Chisholm, of the firm of Chisholm & Hobbs, but by way of retaliation for the fact that he had no nickname, like the rest of us, we barbarously corrupted what he had.

Chisholm headed the Dolphin southeast, and with a light breeze dead astern we laid a diagonal course across the bay. An hour's sailing brought us opposite Rock Island, where we promptly went aground, as the Thompson's Point cottagers had informed the Pedagogue we would; but he had been too much preoccupied with apples and other matters to mention the fact. We accordingly compelled him to strip the buskins from his long legs and explore the vicinity for deeper water. He discovered a channel leading toward the island, and with great difficulty we got the Dolphin off and floated her into a convenient little harbor on the shore side of the island. It was decided to pitch camp then and there, fate having cast us upon a very desirable spot, taking everything into consideration. So it was that the setting sun of Aug. 13 beheld some strange excrescences upon Rock Island—two tents, which from the horizon undoubtedly appeared white, a rude shanty for cooking purposes, and last, but not least, a strangely variegated flag, floating from a pole strapped to the highest limb of the highest tree on the island. The Bass-Killers were domiciled.

Sunday we spent in the over-indulgence of slumber and the invasion of the mainland for milk and eggs. Monday was very warm, and we loafed, getting tackle, rods, flies, etc., into condition for use. We were also visited by a party from shore, one of whom said that he was the fish warden for that township, but that business was dull with him because the Legislature of Vermont was not liberal and large-minded enough in the matter of emoluments. However, he informed us that it was the open season for all lake fish (as if we didn't know), and graciously informed us that we might go ahead and "ketch a wagon load of 'em for aught he cared." Thus sanctioned and commissioned by the local representative of law, we, the Bass-Killers, loyal citizens of the great commonwealth of New York, began active operations on Tuesday morning, the 16th of August. Having engaged the use of a small skiff from a resident fisherman and farmer, our piscatorial fleet consisted of aforenamed skiff and the tender of the Dolphin. As there were seven of us, this meant three men to one boat and four to the other, provided all would a-fishing go at the same time. As no one but Cheese'm was willing to be left out of the count on the first day, a formidable forest of rods might have been seen floating away from Rock Island at 6:30 o'clock A. M. of the 16th of August.

The boats were managed as follows: In the yacht tender, the Scribe, the Reformed Grocer and He-of-the-Big-Cup. In the skiff, the Pedagogue, Paregoric and Et Als. At this point, with one comprehensive bow, I will introduce the *dramatis personæ*. The Reformed Grocer (who furnished the supplies for the party and will collect dues when he can) was so called because of his remarkable aversion to the accustomed tricks of the trade. The slightest allusion to sanded sugar or coffee and beans throws him into a towering passion. His extreme susceptibility on this point makes it natural to infer that at some period of his life a great moral reaction has taken place. He-of-the-Big-Cup earned his compounded distinction from the fact that early in the campaign he appropriated the most commodious tin vessel in the outfit for his personal use, and sipped his quart of ambrosia thrice daily, while the rest of us were forced to be content with a paltry pint. Paregoric is a young doctor, supposed to have begun his practice upon infants afflicted with mild types of inevitable disorders. The Pedagogue needs no introduction. He wears glasses, and it takes an ant an hour and ten minutes to run up the leg of his pantaloons. Et Als is a rising young lawyer. He has already risen to the fifth floor back, and his shingle is only visible from the evening star. Cheese'm, skipper and cook, is an insurance agent. Last and least, the Scribe, comes in for a share of notice which he does not deserve. His first novel is out (of circulation). It fell flat as a pancake, and was done equally brown by the critics.

The morning sun, as I have as good as intimated, gleamed on six fancy rods, as the fleet of the Bass-Killers put out from the camp on the island. The captain of the tender directed her course to a reef about half a mile out. The skiff on the other hand (manned by less experienced fishermen!), made full speed for the river, and soon disappeared behind the curtain of reeds.

When the tender had approached within a stone's-throw of the reef, the oars were laid across the thwarts, and the boat was allowed to drift with the light south breeze over the shallows. He-of-the-Big-Cup stood in the bow and cast; the Reformed Grocer preferred to sit on the center thwart and troll his fly, while the Scribe whipped the water from the stern. As is likely to be the case, the least scientific performer got the first rise. In a very brief space of time the Reformed Grocer's reel began to buzz. The Grocer announced the fact with a yell which would have done credit to a Comanche, and got upon his feet so suddenly that the boat lurched and He-of-the-Big-Cup plunged headforemost into the limpid water. As the depth of the latter was not over 4ft. at this point, it was not long before the astonished angler reappeared, and gathering up his rod and hat, made for the tender with an expression of countenance which boded ill for the personal comfort of the Reformed Grocer. The latter, however, was so busily engaged with his finny antagonist as to be utterly oblivious of everything else. And well he might be, for he had evidently hooked a monster. The slender rod bent like a willow twig, and the reel fairly sung as the line went spinning out.

Suddenly the bass took a turn around the boat. He-of-the-Big-Cup saw the line coming, and his animosity immediately changed to the liveliest interest. "Look out!" yelled the Grocer. "You'll get me tangled up." He-of-the-Big-Cup plunged for the boat, but it was too late. The line came swishing across him. Dropping rod and hat, he grasped it, and to the unspeakable horror of the Reformed Grocer, proceeded to haul in, hand over hand, as though the oiled silk was a trolling cable. It was a *coup de-main* never before equalled in the annals of the Bass-Killers. Steadily, surely, swiftly the bedraggled angler roped in his victim. I shall never forget the look of intensity, of determination which sat upon that countenance. The water dripped unheeded from nose and ears and plastered locks. His eyes were fixed intently upon the swaying line and the swirl of waters where the lordly bass was fighting against fate. Now comes the expected rush, the leap in air. Like the spokes of a whirling wheel the arms of the angler gathered in the slack. Well done, Thou-of-the-Big-Cup! Now gently; keep his head out of water; don't let him swing off toward the boat.

"Jump out and land him, one of you!" gasped He-of-the-Big-Cup, with suppressed emotion. "Don't let him rub against the boat." The Scribe snatched up the landing net and slid over the edge of the tender. Side by side with Him-of-the-Big-Cup, peering out into the transparent water, stands the man of the quill. It is the last act of the drama. The Reformed Grocer, defrauded of his laurels, looks upon the scene, with mouth expanded, awaiting the issue. Nearer, nearer comes the exhausted bass. The net is slowly submerged; the Scribe is waiting his opportunity.

Look out!—a dash, a churning of the water. For an instant the broad back of the bass appears on the surface. The Scribe swiftly brings the net underneath. It is raised, and a triple shout goes up. There in the meshes flops the monster bass! The Reformed Grocer paddles the boat alongside. The net and its contents are carefully assigned to him. A whack of the bludgeon and all danger of escape is over. He-of-the-Big-Cup climbs over the bow. The Scribe climbs over the stern; and the Reformed Grocer rows us back to camp.

Presently the other boat returns—with a slimy pickerel! The Big Bass is suspended in front of the camp, with a card in his mouth announcing to all whom it may concern that his lordship, undressed, weighs 5¼lbs.

"Who caught him?" asked the Pedagogue.

"I," said the Reformed Grocer.

"I," said He-of-the-Big-Cup.

"I," said the Scribe. PAUL PASTNOR.

ON THE GASCONADE.—I.

"HELLO, Will, what do you say to a trip to the Gasconade?"

"Say? Why, that I want to go, of course. When do you start?"

"In two or three days. The party will consist, if you go, of yourself, Frank T., William M., and my boy, Alex. That'll make two Alexs, two Bills and a Frank. If the Bills can't pay us out we'll have to be Franked through."

"Humph!" was the reply, "we'll pull through well enough, the main thing is to get away from business, but I reckon I can manage it. You may count on me to go."

The first speaker was the narrator of this tale; the gentleman he addressed, the mayor of the city; Frank T. the circuit clerk of the goodly county of Lafayette, Billy M. a prosperous merchant of the place, and Alex., the twelve-year-old son of the writer. Formality is no part of an outing, therefore we will in this truthful story simply distinguish between our two Williams by speaking of the mayor as Will and of the merchant as Billy, being incited to take the liberty with the latter by the circumstance that while he has long since arrived at the years of discretion, he has, so far, failed to add to himself the dignity of a wife. He says that this is accounted for by the fact that he has arrived at years of discretion.

It was about the first of October, 1886, that I write of. The days were balmy and soft, the nights deliciously cool, but without frost; weather to make glad the heart of man, and with just enough chill in its nocturnal hours to discourage the mosquito.

I am writing this now, months after the occurrence, but with the temptation to renew them now at hand, as much for my own gratification as for that of the reader, and hence shall stray aside into occasional paths of fancy which may seem immaterial to a consecutive relation of incidents, but I trust when the last line is penned and finis is written after the account of this sojourn in the woods and upon the water, that those who love sport and nature may have accompanied me, as the backwoodsman would say, from eend to eend.

There is a good deal in Pope's idea of the pleasures of anticipation, and he is neither man nor sportsman who does not as much enjoy the preparation for an outing as the trip itself. It is not necessary to speak about the boy. We have been boys ourselves, and know how it is. The next few days were to him an epoch of unalloyed bliss. He rigged tackle in the daytime, and dreamed at night that he was catching bass as long as his leg. He abbreviated Gasconade to Gasky, mingled a little slang with his talk, but never spoke or thought of any other subject. His seniors, all old sportsmen, three of them soldiers of the civil war, therefore veteran campers-out, to tell the truth were not far behind him, and in their spare moments got together their duffle.

Do you want a list of it? Well, here it is. One good, heavy A tent; each fellow his roll of bed clothes, gum blanket, coat and an overcoat. A mess box containing a boiled ham, a side of breakfast bacon, a big bag of beat biscuits, a pound cake. In tight tin buckets, 5 pounds of granulated sugar, 3 pounds of good coffee, ground; 5 pounds of lard, and 3 pounds of nice, yellow butter. Flour, meal, baking powder, a quarter of a pound of tea, salt, black and cayenne pepper, pickle, a sauce or two, and, don't avert your head, some onions. However unrefined this esculent may be at home and among delicate and æsthetic people, it is an indispensable adjunct to a well-ordered outer's *pot-au-feu*—in this instance the French means stew pot on a camp-fire.

You can see, that fish or no fish, game or no game, our party did not mean to go hungry.

As to a cooking kit we had the usual array of camp kettle, frying pan with a detachable handle for convenience of packing, coffee pot, two or three stew pans, ten plates and cups, knives, forks and spoons, cup towels and dish rags, for this individual, who was, by preference, the cook, as the cook generally rules the roost in camp as elsewhere, wants the dishes washed after every meal as spick and span as would any woman at home. The cooking utensils are made to nest, so that with the table ware inside of them they occupy altogether about the same space that would a common three-hoop bucket.

All of the above were packed in a strong box, three feet long and two feet wide, with a hinged lid, which when thrown back and resting on a firmly fixed peg or two made an excellent table. This box is furnished with rope handles at each end, so that it may be checked as baggage upon the railroad.

It is very easy to get along with much less than we have enumerated above, but this party believes in having a good time when it is out in the woods, where it does not go to "rough it" but to smooth it, to take out the wrinkles, placed there by the every-day cares of life. Therefore, it looks well after the creature comforts. Those who prefer to do otherwise may follow their bent; when we go out and you call to see us in Raccoon Hollow or at Possum Bend you can generally be pretty sure that we'll give you a square meal.

After the duffle comes the tackle. Well, each fellow has his joint pole, mine an old-time friend that has been upon many a jaunt—ash butt and second and third joints, with three or four lancewood tips. It is a little heavy at the butt, maybe, but it is always there. The mayor has a light, fancy little thing, pretty to look at and nice to handle, but it came to grief as we shall narrate in the proper place. Frank and Billy have substantial bamboo rods, the boy a cheap but strong affair. In our ditty bags we have all manner of fancy baits—flies, spoons, artificial minnows, &c., but withal plenty of good, sound tackle, with reels, some old, some new, but all sensible machines not likely to get out of order. In my ditty bag I find, besides, a neat little "housewife" containing needles and thread, buttons, pins, &c., very convenient to have sometimes. Things that "when you want 'em at all you want 'em bad." Then there is a bottle of black stuff—not a black bottle of stuff, but just as I write it, a bottle of black stuff—oil of pennyroyal, castor oil and tar. A coat of that on the back of your hands, the middle of your forehead and the end of your nose, will render them impervious to the attacks of mosquitoes and black gnats. We had

neither on this trip, but, as Mrs. Toodles told her better half when she bought a bargain in a doorplate bearing the name of Thompson, there's no telling in this world what may happen and it is well to be prepared for all emergencies. A long minnow seine, two minnow buckets, live nets, a lantern, a number twelve breech-loader and 42 Winchester complete the outfit—at least I think so. If I have neglected to mention anything we should have had it is because I have forgotton, not because it was missing from the list. How could it be otherwise with two old mai—, bachelors, I mean, with nothing else to think of for a week.

So, at 8:40, P. M., on a certain day last autumn, we left Lexington, all comfortably seated in a chair car on the Missouri Pacific, a railroad that has as well equipped trains as are to be found in the United States.

When a man has his eyes and ears about him he can always see something of character. Someway, a railroad car is a good place to observe it. Everybody knows how he is impressed with the cad in the velvet vest, with the big fob and the expansive shirt front. There is as plainly written in his lineaments and his movements, self-satisfaction and the pride that he takes in a fat pocket-book, as if he were speaking it in the vernacular. People become themselves after they have been jolted, dusted and be-cindered in a train for a few hours. The petulant are petulant, the cross are cross and the patient are patient.

Now for two incidents to prove this. Just back of us was a middle-aged curmudgeon—not that the curmudgeon appeared upon the man at once. He was fairly good-looking, rotund, appeared to be well kept, and upon his partly-bald head he had the usual skull cap. At a station, enter a young gentleman and lady, the latter as pretty as a dream in May. They are going through. Nowhere are there two seats together that they can get. The one next the curmudgeon is vacant. The lady is placed in it by her companion, who goes forward to see if he can find two chairs together. Directly he returns, unsuccessful. He seats himself two chairs away, when the lady somewhat timidly says to our friend the bear: "Sir, could you kindly exchange seats with that gentleman; we are going through and would like to sit together?" "Humph?" grunted the person addressed. Thinking that he had misunderstood her, the lady repeated her request, when he rudely ejaculated, "Naw!" and turned his back upon her. The girl subsided. Poor thing, how sorry I felt, but I could not help her. What emotions and sensations that porcine person deprived these two of. Evidently lovers, the evening being coolish, how sweet to nestle under the same blanket and furtively squeeze hands occasionally. There be cruel moments in this world of ours.

The other picture! Well, it is a very simple one, with a little darky for its hero. Just opposite me, soundly sleeping, well dressed in brand new togs from cap to shoes, sleeps the sleep of the just, a good-looking negro lad eleven or twelve years of age. A gentleman with him, evidently a gentleman by his appearance and manners, every once in a while covers the boy with the big blanket that slips down from the motion of the rain. He seems to care for him as tenderly as he could if he were white and his own. In a conversation before morning, as we were each stretching our legs in the smoking room of the car, the gentleman, who was a southern planter, told us that the boy was the child of one of his servants and that he had, seven years before, been stolen, during an exodus of the negroes to Kansas. That he had recently heard of and followed him to that State, but had been compelled by the removal of the people who had him to go 600 miles further. That he had finally found him, and was now taking him to his mother. It is often said that you must never judge people hastily. That depends. I saw the two men whom I have here described but a few hours, and I was never "introduced" to either of them, yet I would stake a great deal that I have "sized them up" correctly, and that one was a curmudgeon and the other a gentleman.

All this time, our party, scattered up and down the coach, was variously occupied. Our Frank old bachelor divided the time between snoring and smoking, and "tother one,' our Billy, being a native born Puke, was amusing himself after the manner of his kind, making a sound like a desperate attempt at ejaculating New York, between a word and a snort and with his head out of the window. That is a way he has when he rides on a train. The Lord only knows what he would do if he were to go to sea.

All in good time our train reached Pacific, where we were to change to the 'Frisco for Crocker, from which place we were to debark for the Gasconade. The hour being so early the town was pacific indeed. Even the dogs were asleep, and for some time not a sound greeted us as we walked about the streets. Finally the doors of the hotel were opened and pretty soon breakfast was announced by mine host. Billy was still a little pale, but the way William made the beefsteak fly was a caution. The coffee was fair, the potatoes first-class, let a Teuton alone for that, and the beefsteak very satisfactory.

We arose from the table much refreshed. Billy, whose stomach had returned to its normal condition, found one of his immense boots, we had almost written it "boats," to be chafing his ankle, and hunted up a shoemaker to doctor it in some way. Moral—Never permit anybody to persuade you into buying heavy wading boots, or heavy boots of any kind to go outing in. Either a broad-bottomed, low-heeled, light boot, or a similar shoe, is the thing for the woods. Something large enough, not too large, and soft. If it is a boot it should be loose in the instep, so that it can be easily pulled on or off when wet.

After a while the 'Frisco train came along, and our two trunks and lesser impedimenta were quickly loaded in. We found good places, and were very politely treated by the conductor and train men. From Pacific, the agent, Mr. Dickerson, had kindly inquired by wire about the two boats engaged for us at Arlington by that prince of sportsmen, Dr. I. G. W. Steedman, of St. Louis, then chairman of the State Fish Commission, so that when we reached that place we found them upon the platform awaiting us. They were quickly put into the express car and away we went again up the mountain.

The 'Frisco is a beautiful road to travel over, and we cannot see why so many persons go away from Missouri to find the picturesque when they have it in such perfection in our own State. We shall have more to say as to that in connection with the Gasconade when we get there.

We reached Crocker at 4:30 o'clock P. M., just twenty hours away from home. This is a village in Pulaski county, about five miles from the point at which we intended to begin our fifty-mile descent of the Gasconade River. Here we employed a gentleman named Craddock, who, we are told, divides his time between acting as guide and philosophizing upon political economy, to haul our boats and other traps to the river. It was not many minutes after we reached the station until our cortege was en route. The two Bills and the boy walked in advance with the artillery. I perched myself on the bow of one of the boats as ballast, and to draw out the gentleman from Kentucky; and Frank, who carries a stiff leg from a Minie bullet received at the Battle of Pea Ridge, seated himself elsewhere in the wagon.

It was not hard to make the gentleman from Kentucky talk. It hardly ever is. We did not introduce ourselves to him, as we knew he would want us to engage his services, and we did not desire to be chaperoned, but he saw our names upon our boxes, and we hadn't gone a mile and a half until he called us by them as pat as if he had known us for twenty years, and he didn't use any handles to them, either. Why should he? What is the use of conventionality in the woods? He was a useful fellow—he talked a blue streak. He never ceased to talk, except to expectorate. He told us the biography of several of the public men of southwest Missouri, assured us of the intimacy of his acquaintance with Frank Cockrell, and that George Vest would have gotten him a position of Indian agent, post trader, or something of that kind, if another fellow had not unfortunately gotten the place, much to the sorrow of George and of himself.

He told us that the road we were traveling over had been made by an enthusiast named R. M. Boatwright, who had discovered guano deposits in an immense cave on the Gasconade, near where we were to camp. That he had built the road, in many places cut into the solid rock, at a cost of $1,800, and had spent $3,000 or $4,000 more for machinery to prepare this guano for market, when he considered that his fortune was made, as the chemist told him that this article, when produced by bats, was much more valuable than the variety in which Mr. Blaine dealt in Peru. After the guano mine was fully developed Mr. Boatwright shipped five cars of it to Baltimore, where it was sold, bringing $400 less than the freight alone amounted to, and so the speculation had fallen into innocuous desuetude.

Mr. Craddock told us that he was a first-class bass fisherman, and we believe in that he told the truth; he assured us that it was impossible for us to find our way down the river without his pilotage; that we wouldn't know where to find the water in the river, the springs to camp by, or the places in which best to lure the wary bass. These oracular utterances delivered he would expectorate and await an answer. None coming he would resume the thread of his discourse.

He lingered lovingly on some of the experiences which he had had taking down the Gasconade fishing parties whose principal occupation seemed to have been to fill themselves with bug juice. He inquired in an indirect manner as to the character of our tipple. He advised us to lay in a plenty of eggs. Evidently his idea was that fishing parties could not exist without eggs to eat and whisky to drink. He concluded by assuring us that we would at least have to employ him for a few days just to show us how to start off.

By that time we had reached the river, and we very unceremoniously went to dumping our paraphernalia out of the wagon. As we got through, Mr. Craddock intimated to one of the boys that it had been a rather long time between drinks, and was informed that while we regretted any inconvenience it might be to him there was not a drop of wine, brandy, whisky, beer or any other intoxicant in the crowd, not even a phial full for snakebites. His form straightened, his nose elevated of its own accord, his lip curled, he received the shekels for his drive in sad and pitying silence, he turned away and shook from his feet the dust of such an unprovided camp as that. Forsaken and unbefriended in a strange land we went into our bivouac.

So here we are, twenty-four hours out from home, cosily camped on the banks of the Gasconade, our two boats floating lightly on its waters, which but a few yards higher up come foaming down in rapids, making a roaring sound that inspires us with that uncertainty of what dangers may be before us which constitutes the spice of adventure. Our first camp was named Trigg. It was upon a point of land between the road and the river's bank, under some grand trees.

A very few minutes sufficed to pitch the tent, start a fire, fry some bacon, get a cup of coffee, and fall to. It was a beautiful evening. The crescent moon had early disappeared, and left the stars to reign over the night with their mellow light. The tree frog chirped his little song, the wind sighed gently through the swinging boughs, and to the grand refrain of the tumbling waters we talked over old adventures, speculated on those before us, and finally snugging ourselves among our rugs and blankets fell to sleep to dream of big creels and a happy time.

The next morning came bright and clear, and we had an opportunity to see what the river looked like. Above the camp were the rapids of which I have already spoken, opposite where our boats were moored a broad, smooth piece of water, but evidently shallow, a ford. The boats were lightly riding to their painters. Both were long, shallow, scow-shaped affairs, of a bright red color, drawing the least imaginable depth of water. The larger one was provided with oars, the smaller one with two paddles.

Breakfast was hurriedly disposed of and the boats quickly loaded. Frank, Billy and the lad took the boat with the oars and were given the mess chest and the dog. By the way, I forgot to tell you about the canine. When our Kentucky friend left us the night before there remained behind him a handsome setter dog. He was intelligent and obedient, but deaf. He was very affectionate, and like a woman infatuated with the wrong man, he wouldn't be shaken off; so despite many shifts and devices to get rid of him he stuck to us through the trip, and when we traveled was a regular passenger in the big boat. The boy named him Scraps, because he lived, perforce, upon the crumbs that fell from the fishermen's table and, we regret very much to say, these crumbs were sometimes rather meager in quantity. At others there was plenty and Scraps fared sumptuously every meal, so that at any rate he "averaged up" pretty well, which for a stray dog is doing about as well as could be expected. He had fallen into the hands of men who love a good dog and could not misuse him, otherwise there were occasions when he indulged his propensity for water by swimming to the boats when the occupants were fishing that would have brought to him a dose of cold lead. We do not know that it is anywhere laid down in books that dogs are amphibious, but certainly that one seemed to be so. When it was desirable at times to leave him on the shore he would swim and reswim the river from side to side, up and down, for incredible distances, and finally wind up with his piteous whine in persuading our old bachelors to take him aboard, where, faithful beast, he was as fully contented in the companionship and sympathy of man as he would have been upon rugs of down in a palace of alabaster.

And so at last we are afloat upon the bosom of the Gasconade, Will and I in advance, lightly paddling our canoe and piloting the way when we come to those places where the aforesaid bosom becomes ruffled and turbulent. There be heaving and tumultuous bosoms even upon rivers, as we learned full well before we got to Arlington again. I know of no better place than this to tell you what the Gasconade is. I can't say that I admire the name particularly. It is not musical, and I can but bear in mind that it comes from the province of Gascony, the principal characteristic of whose people is, that they are boasters, so much so that the verb gasconade in our language means to boast, to bluster. Maybe you will say, "But that seems to be a very appropriate concomitant to fishing, does it not?" Well, we shall see. If I tell any big tales about our catches, or the weight of the fish we capture, that will do. Just now I do not mean to do so; but good intentions, I know, are said to make pavements in a very bad place. At any rate, Gasconade in this instance is a noun and not a verb, and it is the name of as beautiful a river as the eye of man need care to gaze upon.

A. A. L.

Lexington, Missouri.

ANGLING PATENTS.

THE following is a list of patents issued by the United States during the years 1882, 1883 and 1884, relating to angling and fishculture, taken from a list of all patents relating to fish, the methods, products and applications of the fisheries in the report of the U. S. Fish Commission for 1885, prepared by Robert G. Dyrenforth, Assistant Commissioner of Patents, U. S. Patent Office. In the original there is a description of each invention and the claim with an illustration, which those especially interested may consult. Many of the articles are of real value, while some of them are mere pot-fishing devices or are complicated absurdities: of the worth of the inventions we will not judge, leaving this to individual taste:

Signals Telling when Fish Take the Hook: Marcene H. Whitcomb, Holyoke, Mass., Feb. 7, 1882; David B. Tiffany, Xenia, O., June 12, 1883.

Spring Hooks: Richmond A. Wentworth, Appleton, Me., Aug. 29, 1882, and Aug. 21, 1883; Charles J. B. Gaume, Brookly, N. Y., Feb. 13, 1883; Cicero Fisher, Temperance Hall, Tenn., June 19, 1883. Merrill R. Skinner, Hamburg, N. Y., Oct. 9, 1883; Frank DeForest, DeSoto, Mo., Sept. 12, 1882; William N. Greer, Watertown, Dak., July 3, 1883; Karl Müller, Hornberg, Baden, Germany, Feb. 7, 1882.

To Prevent Fish Swallowing the Bait: William C. Bower, Union Springs, Ala., Dec. 30, 1884.

Hooks With Baiting Needle: William E. Hemming, Redditch, England; Assignor to Charles F. Imbrie, New York, Feb. 28, 1882. Spring Hook (Spoon): W. T. Love, Buffalo, N. Y., April 25, 1882, and 25, 1883; Louis C. Wylly, Patterson, Ga., July 18, 1882; Lysander S. Hill, Grand Rapids, Mich., Nov. 7, 1882; Chrystopher Hymess, St. Louis, Mo., March 13, 1883; Louis Kessler, Ludington, Mich., July 10, 1883; Artemus Lord Dawson, Elk Point, Dak., Dec. 4, 1883; William Dudley Chapman, Theresa, N. Y., March 18, 1884; Charles H. Hibbard, Grand Rapids, Mich., March 25, 1884; Harry Comstock, Fulton, N. Y., Jan. 30, 1882; Ernest F. Pflueger, Akron, O., Feb. 13 and Aug. 28, 1883.

Trolling Hook (Squid): Newton A. Dickinson, Chester, Conn., March 18, 1884.

Leaders or Casting Lines: Carl L. Bollerman, New York, Dec. 4, 1883.

For Rotating Fly or Bait: Archer Wakeman, Cape Vincent, N. Y., Aug. 12, 1884.

Fly-Books: Francis Endicott, Clifton, N. Y., assignor to Charles F. Imbrie, New York, N. Y., May 23, 1882; Chancellor G. Levison, Brooklyn, N. Y., March 11, 1884.

Floats: Oliver G. Wilson, Gallatin, Tex., July 18, 1882; Ralph W. E. Aldrich, Northampton, Mass., Jan. 9, 1883; Victor Vidal, Jr., Pignans, France, Dec. 11, 1883.

Tackle Case: Henry F. Price, Brooklyn, N. Y., April 10, 1882.

Line and Hook Guard: W. W. Byington, Albany, N. Y., Dec. 9, 1884.

Sinker and Hook Holder: Sylvester E. Smith, St. Louis Jan. 24, 1882.

Hook Holder: Henry Van Altena, Milwaukee, Wis., June 12, 1883.

Sinker: Hale Rix, San Francisco, Cal., Sept. 18, 1883.

Reels: Julius Vom Hofe, Brooklyn, E. D., N. Y., assignor to himself and Charles F. Imbrie, New York, Jan. 17, 1882; Warren Ohaver, and Taylor O'Bannon, Indianapolis, Ind., assignors to the American Reel Company of same place, Jan. 31, 1882; Franklin R. Smith, Syracuse, N. Y., assignor of one-half to Willis E. Barnum, of the same place, June 20, 1882; James B. D'A. Boulton, Jersey City, N. J., assignor to William Mills and Thomas Bate Mills, New York, July 11, 1882; George H. Matthews and John T. Ostell, Montreal, Quebec, Canada, Sept. 12, 1882; Edward C. Vom Hofe, Brooklyn, N. Y., Jan. 23, 1883; George H. Palmer, Fair Haven, Mass., assignor to Thomas M. Bissett and Thomas J. Conroy, New York, July 24, 1883; Thomas H. Chubb, Post Mills, Vt., July 31, 1883; John Dreiser, New York, Aug. 14, 1883; Anton Lang, Brooklyn, N. Y., Aug. 21, 1883; Frederick Malleson, Brooklyn, N. Y., Sept. 4, 1883; Henry C. A. Kasschau, New York, Sept. 25, 1883; William N. Lockwood, Campville, Conn., April 1, 1884; John Kopf, Brooklyn, N. Y., assignor of one-half to Thomas B. Mills, of same place, Oct. 7, 1884.

Method of Making Reels: John Kopf, Brooklyn, assignor to Thomas B. Mills, of same place, Dec. 16, 1884.

Reel Fastenings: Louis A. Kiefer, Indianapolis, Ind., Feb. 21, 1882; William B. Doubleday, Binghamton, N. Y., assignor to Henry H. Doubleday, Washington, D. C., Sept. 18, 1883; Gilbert L. Bailey, Portland, Me., March 4, 1884; Henry F. Price, Brooklyn, N. Y., Aug. 5, 1884; Hiram Eggleston, Manchester, Vt., assignor to Charles R. Orvis, of same place, June 6, 1882.

Tic-Guides for Rods: Thomas H. Chubb, Post Mills, Vt., Aug. 29, 1882.

Ferrules and Couplings for Rods: Thomas H. Chubb, Post Mills, Vt., Sept. 12, 1882; James E. Langdon, Torrington, Conn., Sept. 25, 1883; Justice Webb, Georgetown, Ky., Aug. 12, 1884.

Rods: George P. Andrews, Staffordville, Conn., Jan. 10, 1882; William Mitchell, New York, Jan. 9, 1883.

Rod Tips: Thomas H. Chubbs, Post Mills, Vt., May 8, 1883.

Tension Equalizer for Rods: Richard Smith, Sherbrooke, Quebec, Canada, June 26, 1883.

Landing Nets: Jasper N. Dodge, Detroit, Mich., Jan. 16, 1883; Otho M. Muncaster, Washington, D. C., Feb. 13, 1883; Richard J. Welles, Chicago, Ill., assignor to William Mills and Thomas Bate Mills, Brooklyn, N. Y., March 6, 1883.

Mixture for Fish Baits: Carol F. Bates, Hughes Springs, Tex., Oct. 21, 1884.

Bait Kettles, or Minnow Buckets: Willis H. Sherwood, Saint Joseph, Mo., June 3, 1884; Richard K. Evans, Washington, D. C., June 3, 1884; George W. Barton, Bethlehem, Ky., July 15, 1884; Thomas W. Rudolph, St. Louis, Mo., assignor of one-half to Chas. D. Moody, Webster Groves, Md., July 15, 1884; Charles F. Busche, St. Louis, Mo., Oct. 27, 1884.

Sportsman's Game Carriers: Edward Bourne, Alleghany, Pa., Feb. 14, 1882; Addison White, Huntsville, Ala., May 1, 1883.

Fishways: C. W. Trammer, Great Falls, Md., Oct. 16, 1883.

Fish-Hatching Apparatus: Marshall McDonald, Washington, D. C., assignor to himself and Stephen O. Brown, of the same place, September 5, 1882; Livingston Stone, Charlestown, N. H., May 15, 1883.

TROUTING ON THE PASSADUMKEAG.

II.

THE Doctor declined to give any account of their trip up the river until after supper, as they had partaken of nothing but a hasty lunch since leaving camp in the morning; so securing the cubs with our bundle straps we all sat down to supper, well knowing that it would be useless to try to elicit any account of the day's doings until the rigid, determined expression on the Doctor's countenance cleared up, and he considered it his duty, however, to inform us that the bear must be skinned the first thing after supper, and the ownership of the same decided by lot; as for the cubs he thought he had a legal right to one of them at least, as they had nearly ruined what little wearing apparel he had, to say nothing of sundry scratches about the knees, somewhat deeper than the clothing.

Supper being finished and our duty having been made plain to us, we proceeded to move the carcass of the bear from the boat to the light of our camp-fire, and under the direction of Adams, who was well up in the art of preparing skins for ornamental purposes, we decided that this skin would be the most useful as well as ornamental made into a mat, as the fur was fine and glossy-black, so in skinning we took great care to remove the feet and claws with the skin intact, as well as the head, leaving the upper part of the skull with the jaws attached to the skin. We cut some stiff slender poles which were quite springy, and proceeded to stretch the skin by placing them lengthwise and crosswise, bending each pole so the spring would stretch the skin in the right direction. This being accomplished, preserving compound was rubbed over the flesh side, and it was hung up to dry. Lord and Pettengill had in the meantime prepared such parts of the carcass as they considered the most edible, and consigned the remainder to the river.

Our work being now done the Doctor informed us that the laborer was not only worthy of his hire, but the late worker was entitled to an extra supper, and although not up to all the mysterious arts of cookery he had prepared with his own hands a lunch which he now proposed to stake his reputation upon, whereupon he proceeded to rake from the coals of our camp-fire three lumps about the size of a man's head; they resembled rocks, but after brushing the ashes from them we found them to be composed of blue clay and were informed that each lump contained supper for two. A few smart raps with the hatchet sufficed to break the lumps into halves, first disclosing a mass of feathers embedded to the inside of the clay ball, then the body of a—"can it be a partridge?" No, but they were done to a rich brown and fragrant with appetizing odors, "truly a lunch fit for the gods."

After lunch we repaired to our tent to listen to the Doctor's account of the capture of the bears:

"We paddled up the river as far as the Lower Taylor Brook, which we reached about noon, only stopping once to try the trout at cold springs, where we caught several very fine ones. While we were quietly resting on the right bank at the mouth of the brook, our attention was called to a strange whining noise in the river a few rods above us. On looking, what was our surprise to see a large bear swimming across the Passadumkeag from the opposite side, followed by two cubs, which were whining piteously, evidently disliking their cold bath. The bear was heading for a point about three rods above, and evidently had not seen us, as she manifested no fear. Heald, with his Ballard across his knee, quietly waited for the bear to reach the shore. Heald raised his rifle to his shoulder, and at the same time giving a sharp whistle to attract her attention. She raised her head to listen, and on the instant the crack of Heald's rifle echoed among the hills. The bear made one convulsive struggle and sank to the ground just at the edge of the river, the ball had entered her brain just forward of the ear. Heald and myself sprang to the shore to intercept the cubs, while Pettengill took to the boat to head them off should they attempt to recross the river, a precaution which saved us the cubs, for as we reached the bank they turned and swam for the opposite shore. Pettingell was on hand, the bow of his boat not 6ft. from them, the stern near the bank. I sprang aboard, at the same time giving the boat a vigorous push in the direction of the cubs. We were upon them before they reached the opposite shore, and succeeded in getting a rope around their necks without much trouble while they were in the water. We then lifted them into the boat regardless of their teeth and claws, and hitched them up closely. They were sorry-looking objects, their resistance seemed to be wholly defensive. It was not without a pang of regret that we lifted the carcass of the dead bear into the boat. The cries of the little ones were distressing, they were trembling with fear, or the effects of their cold swim, but the warm sun soon dried them off, and if it did not elevate their spirits it certainly improved their appearance. We decided to return to camp at once, concluding that paddling a boat twenty miles and capturing three bears was a day's work not to be grinned at."

The Doctor's account of their day's doings, being thus briefly told, we retired to our couches, a tired but happy company.

We arose the next morning feeling none the worse for our hard jaunt and tiresome work of the day before. Our breakfast consisted (in addition to our usual fare of fried trout, baked potatoes and coffee) of a bountiful supply of broiled bear's steak, which our guides declared to be very toothsome. We decided, however, than an appetite for bear's steak would have to be acquired, and as time with us was precious, we concluded that trout were good enough for us. As the day promised to be lowry, we decided to remain about camp, as we had much to do. We first made a rude cage about 2½ft. square, in which to keep and transport the cubs. We found it no easy job to remove them from the box (into which we put them during the night) but with the aid of the straps which we had put around their necks, as a second precaution against escape, we finally succeeded in dragging them out without injury, and placed them in the cage. The Doctor proposed to devote the day to civilizing them. They were not at all inclined to be petted at first, but after two or three hours' persistent and gentle stroking about the head and face with a smooth stick, scratching their ears and rubbing them under the jaws, the Doctor so far overcame their fears that they allowed him to stroke them with his hand, and even seemed to solicit it. We then prepared some condensed milk by diluting it largely with warm water, and making it quite sweet, which, after a little patient coaxing, the Doctor succeeded in making them eat from his hand. While lapping the milk they kept up a constant purring noise, loud enough to be heard for several rods. After eating the milk, they went into the nest of dry moss which we had gathered for them, and soon were oblivious of all the restraints that civilization had placed upon them.

As the day advanced the clouds began to clear away, and by noon the sun was shining bright and warm. Heald suggested, "that as we were all languishing for something to do," we avail ourselves of this opportunity to pot our trout, which we had promised to take home to some of our friends (we had taken into camp several two-gallon stone pots for this purpose, together with such other materials as were needed to preserve trout in this manner). This suggestion was approved by the whole party, as this would call for more fishing, about seventy-five being required to fill our pots. The first thing to be done was to prepare our ground oven for cooking the fish. This Lord and Pettengill knew just how to do, and they proceeded at once to dig a trench six feet long by eighteen inches wide and one foot deep, this they filled with dry wood and set a-fire, which was left burning for two or three hours. As soon as the sun began to cast shadows upon the river, we each selected a favorite locality for casting our flies, and commenced the exciting sport. Lord and Pettengill were to dress the fish as fast as caught. The trout, if possible, seemed more plentiful than on the preceding day, the river seemed fairly alive with them. I believe it was possible for one man to have caught one hundred in two hours, with tackle and flies of suitable strength to permit of landing at once. Fishing as we were with single fly, and being from five to fifteen minutes in landing each fish, we had at half-past six caught seventy-three, an average of twelve to each man in little over one and a half hour's fishing. Our guides had them dressed and all ready to pack into the pot.

Our method of potting was to pack them heads and tails, as closely as possible, sprinkling over each layer a handful of whole spices. When the pots were full we put into each 1½ pints vinegar and 2lbs. of butter or olive oil, then putting on the covers and stopping the joints with clay, we raked open the coals and placed the pots near the bottom of the trench, covering completely with ashes and coals, where they remained without further attention for six hours, Lord engaging to remove them at the proper time. Prepared in this way trout are simply delicious, and may be kept for months if not disturbed. It being now 7 o'clock and our "labors," or rather pleasures, of the day done, while supper was preparing we listened to a brief lecture by the Doctor on the training of wild animals, with practical illustrations. After supper we mapped out our trips for the next two days, and wrapping ourselves in our blankets, were soon enjoying undisturbed repose. F.

UNITY, Me.

THE UPPER DAM TROUT.

BOSTON, Mass., Nov. 7.—The FOREST AND STREAM was never better appreciated than to-day, in the minds of its angling readers at least. That was a magnificent piece of newspaper work it contained last week, and it was all the better for the reason that it leaves no chance for doubt in the minds of anglers that trout have been taken the past season at the Upper Dam, between Mooselucmaguntic and Richardson Lakes in Maine, in a manner entirely unsportsmanlike, and in a way which, if followed up, would very soon lead to the depletion of trout in these remarkable waters to a greater extent than one not familiar with this region—even with that particular location—would be led to suppose. In the first place the Upper Dam stops the flow of the water of the entire Androscoggin system at that point—the water of two great lakes and one of smaller size, besides numerous ponds and streams. It is natural for the trout family to seek the upper waters at the commencement of the breeding season. Nature has implanted the instinct. It is the one great effort of the parent trout to deposit the spawn, their young, in the safer waters of the smaller rivers and brooks, where they can stay in comparative safety till grown sufficiently large to care for themselves in the deeper waters. Hence it is that the great majority of trout in Richardson Lake below the Upper Dam, at the time the breeding furor is on, are struggling to pass that obstruction and reach the streams above. It is true that some of the trout might seek the streams flowing into that lake at other points, but they are very small when compared with the great volume of water that passes the Upper Dam. Unfortunately, in the *Salmo fontinalis*, the desire to breed begins earlier than on the first day of October, at which date the law for their protection comes on. Indeed, female trout with nearly ripe spawn may be found at that point as early as the middle of August. The females are headed up the stream, and they are vigorously followed by the males. When trout are in the breeding state it is possible for any one, with even moderate skill, to devise means whereby they may be destroyed. They are all headed toward the breeding grounds, and they are so changed from their usual wary nature that they permit of the passage of boats directly over, and within a foot or two of them, without the least alarm. If one could but get the control of a single one of the gates at the Upper Dam, with the condition that no other gate was to be opened, and watch this gate carefully with the proper arrangement of hooks and sinkers at hand, he would be able to secure nearly every fish that desired to pass up the stream, and in this manner he would be sure of taking a very great proportion of the trout that inhabit the lake below.

Such fishing as this is what the FOREST AND STREAM has succeeded in so admirably bringing to light, though it is possible that it was only being pursued in a rather moderate degree. Indeed the parties shown up in that paper are not the only ones who have indulged in watching trout with lines on the bottom at that point. It has been going on for years, only the excess with which it has been practiced has led to its exposure this year. What has been going on is now perfectly plain, thanks to the FOREST AND STREAM, and the Maine Fish Commissioners will know what to do. They will know what sort of legislation to ask for at the session of the Legislature of that State in 1888-9. A warden is sadly needed to be stationed at the Upper Dam, but no angler that I have talked with desires that Mr. Stewart's offer to pay the expenses of such an officer be accepted. The universal expression is that no such warden is wanted there. If it be necessary to shorten the open season at that point by including September, then let it be done, is the idea of all the true anglers that I have talked with on the subject. Again, a suitable fishway is suggested; but that idea is also repudiated by some who have given the subject considerable thought. The exposure which the FOREST AND STREAM has made will put all trout jiggers at that point in their true light hereafter. Anglers with any show of pride will refrain from the practice. Indeed a copy of the FOREST AND STREAM'S articles printed in large type, should be framed and hung up at the Upper Dam, in order that the exposure be not forgotten, and that it might be pointed to in the case of the possible attempt of strangers to take trout in any manner other than with the fly like a real sportsman. Every person I have met that takes an interest in such matters, is highly pleased with the prospect that unfair and illegal fishing at the Upper Dam is now in a fair way to be stopped. SPECIAL.

THE MAINE JIGGING CASE.—In Mr. A. N. Cheney's letter, page 287, sixth paragraph, for "After breakfast time," read "At breakfast time." In ninth paragraph, for "but I did not see him fish the pond or stream below," read "but I did not see him fish the pool or stream below."

SALT-WATER NOTES.

BLUEFISH are our most general salt-water game fish. They inhabit the waters of our entire Atlantic coast and are readily taken with hook and line, and are really good food fish. I do not know that they or drum or sheepshead are found on the Pacific; I never saw any of them there. Drum and sheepshead are seldom taken north of New Jersey, but are quite common along the coast south of that latitude. The bluefish come to the New Jersey coast in May, when the menhaden come, and are found there with the menhaden until quite cold weather. They feed on menhaden and other small fish. When a school of bluefish are feeding they make such commotion that those who are accustomed to their habits at once know what it means; the same with Spanish mackerel off the west coast of Florida. There would be scarcely a gull in sight, and in a very short time hundreds would gather over the school, darting down to catch the little fish that the bluefish have driven to the surface of the water. These gulls must have a very far sight or a sense that we know very little about, to be attracted by a school of fish so far off. It is really a novel sight worth seeing.

Ten years ago bluefish were very numerous; it was really good and profitable sport trolling for them outside the beach and inlets and in the channels inside. I have known two men to catch two tons in two tides. I was once off Seven Miles beach, near Hereford Inlet, with the life-saving station men who set their gillnet while we fished for so-called red drum (spotted redfish). We caught five of the red drum weighing about 35lbs. each. We took with the net 347 bluefish, average 12lbs. each, and they were readily sold for 5cts. per pound. I speak of this to show their abundance. For some years past bluefish and menhaden have been disappearing from the coast. There are so few bluefish that very few seek them, and the menhaden fishery is not so profitable to the pursenets of fish factories. I have been informed that this fall there has been a greater run of menhaden and bluefish than for some years past, and a little harvest has been made by the pursenets. This would show that the bluefish and menhaden are not destroyed, but that such fish will again be on this coast. I have seen fleets of steamers and sailing crafts after the menhaden, so that I do not see how any fish could escape; their nets are only one inch mesh, and take in all kinds of fish. This is the case, I am informed, along the whole coast where menhaden are found. They and other fish must be very much more prolific than we have any conception of not to be exterminated by such netting. The public and sportsmen would be very loath to part with the bluefish. A 12lb. bluefish on a rod and reel is about as much as the fisherman wants to tend to at one time. I know of no stronger and vigorous fish.

Codfish come to this coast in November and are there all winter. They feed on small sand eels 2 to 3 inches long which abound on the sand bars, especially off Long Beach. The codfish are taken very readily with hook and line, and clam bait is used. They are caught from a quarter of a mile to five miles out to sea. They are quite numerous and one would think that a codfish fishery established there would be profitable. I have known boats to be launched from the beach and catch 500 to 600 a day, weighing from 5lbs. to 20lbs. each. Pursenets for the fish factory do not appear to disturb them.

PURVES.

PHILADELPHIA, Pa.

WEATHERSFIELD COVE, near Hartford, Conn., has long been a favorite fishing ground for net-fishermen, who have taken out bushels of bass and other fish. Last week some West Hartfort anglers caught William Frazier and Leander Taylor, of Cromwell, dragging the cove with a seine for bass and pickerel. Game Warden A. C. Collins, of Hartford, was called on, and the two netters were arrested and convicted before Justice Adams.

Fishculture.

Address all communications to the Forest and Stream Pub. Co

THE UNITED STATES COMMISSION.—Since the publication of our list of Fish Commissioners last week, the Assistant Commissioner, Maj. T. B. Ferguson, has resigned, and the President has appointed Dr. J. H. Kidder, of Washington, D. C., to fill the vacancy. Dr. Kidder was a surgeon in the U. S. Navy, and resigned in 1884 in order to devote his time and services to the investigations of the Fish Commission. He bought land adjoining that of the Commission at Wood's Holl, Mass., and built a residence on it so that he might be near the laboratory and the hatchery. He was a warm friend of the late Commissioner, Prof. Spencer F. Baird, and is a man well fitted for the duties of Assistant Commissioner.

THE NATIONAL FISHERY ASSOCIATION will hold a meeting at the United States Hotel, New York city, on Wednesday, Nov. 16, at ten o'clock, A. M., to listen to reports, elect officers, and adopt such measures as shall be deemed expedient for proper representation of the fishery interests of the United States in all matters pertaining to National or State legislation, especially in regard to the legislation which must follow the present diplomatic action of the Government.

A TRIBUTE TO PROFESSOR BAIRD.

NEW YORK, Nov. 5, 1887.—*Editor Forest and Stream:* I herewith inclose a eulogy of Professor Spencer F. Baird, which appeared in the last issue of the *Deutsche Fischerei Verein Circular*, thinking that possibly you would be glad to introduce it into your columns so that the countless number of friends in this country of the distinguished man may know what is thought of him in other lands.—GEO. SHEPARD PAGE, Corresponding Member of the Deutsche Fischerei Verein.

SPENCER F. BAIRD.

A noble friend in a far-away land—a benefactor of the German Fishery Society—has passed away. We mourn at the grave of an earnest, unselfish scholar, who, through a long life, has devoted himself to the interchange between America and Europe of knowledge concerning natural history and natural philosophy, and who has been for years untiring in his efforts to stock Germany with the riches of American waters. Without the expectation of either praise or thanks, he was ever ready to answer questions or give advice. More than this, he always offered to the German Fishery Society that which, after his careful consideration, he thought would be of most benefit to Germany and would be most easily acclimatized. To him the fauna of our country's streams is indebted for the addition, since 1878, of not less than four of the noblest fish of the salmon family, which having become thoroughly acclimatized are now our assured property. These are the landlocked salmon, the rainbow trout, the brook trout and whitefish.

We are also indebted to him for the black bass and catfish highly valued in America, from which we are promised much benefit. No less than 10,000,000 eggs have been transported to Germany from the boundless treasures controlled by the United States Commission of Fish and Fisheries.

We have also to thank Mr. Spencer F. Baird for the participation by America in the International Exposition at Berlin in 1880. He was very urgent in advocating it and the result was a most magnificent completeness of the American department, and it was at once declared the most instructive and important exhibit of any country represented, so that the greatest award of His Majesty, the Emperor, was assigned to Professor Baird.

May America acknowledge the worth of this noble man, and ever honor his labors and him, who through a powerful initiative renewed the almost decimated fishculture, and who has distributed in the waters throughout the east and the west of that mighty land the fish which were natives of but single streams and lakes in limited localities, who even had steam vessels built for the purpose of using them as hatching houses, and to whom every attempt was welcome which had for its aim the acclimatization in America of European fish. That in this last respect we have been able to be of service to our never to be forgotton friend, affords us much gratification. Two species (*Karpfe* and *Forelle*) formerly unknown on the American continent, were brought there from Germany, and astonishing results followed. The carp (if such an expression may be permitted) has begun a new life there. As it in the shortest time increased to almost unknown quantities, the Americans immediately began discussing the best means of taking care of the newcomer, and a publication has been established devoted exclusively to the culture of carp in the various regions of the Union.

We learn with satisfaction that Prof. G. Brown Goode, for some years a co-worker with Prof. Baird, will fill the vacant place. May the loved scholar, whom many of us remember, worthily follow the footsteps of his predecessor. He will at all times find us ready to work with him in the same spirit of brotherhood which bound us to the deceased.

Spencer F. Baird was born at Reading, Pa., on the 8th of February, 1823. He was Secretary of the Smithsonian Institution at Washington. He died on the 18th of August, this year, at Wood's Holl. He will long continue to live in the hearts of his German as well as his American friends. *Ave cara anima.*

BERLIN, Oct. 13, 1887.

PROPAGATION OF CODFISH.

WE take the following from the Cape Ann (Mass.) *Breeze:*

The United States Fish Commission, which has done so much valuable service for the New England fishing interest, is about to establish a fish hatching station at this place, and the Commission will, it is said, ask the Lighthouse Board for permission to erect a suitable building on Ten Pound Island. The contemplated movement is meeting with much favor from the principal fishing owners and fishermen of other New England ports as well as here. They have brought the matter to the attention of Captain J. W. Collins of the Fish Commission schooner Grampus, whose opinion is asked on the subject, and the necessity of establishing such a station for the artificial propagation of food fishes, as the fishermen believe that much benefit will come from it in the near future.

A large number of our fishermen who depend solely on the inshore fishing, say that unless something is done to stock the waters by artificial means, the fish near the coast will become extinct. They believe that the propagation and distribution of salt water fish can be carried on as successfully as has been done with fresh water fish, which the United States Fish Commission have done so well with in stocking all the great lakes and rivers. In 1878 and '79 the Fish Commission had a station here, and the first experiment of hatching codfish was successfully accomplished. From the results of their labor one and a half millions of young fry were hatched and deposited in the harbor. At that time codfish were very scarce along the shores of the Gulf of Maine, especially off Cape Ann and in Ipswich Bay, and the prosecution of fishing in those waters was generally a failure, and fish enough could not be caught to supply the local markets of Essex county. Two years after the Commission had deposited the young cod in this vicinity the harbor was seen to swarm with small codfish from nine to eleven inches long. It was then thought by the fishermem that the appearance of these small fish in these waters was none other than the result of the labors of the Commission. The years of 1884 and '85 found the fish off Cape Ann and in Ipswich Bay abundantly. They had grown to fair proportions, and were caught in large quantities by the shore fishermen on trawls and in gill nets; while the codfish were never seen so plentiful off Cape Ann as during the winter and spring of 1886-7, and the fish were of a very large size.

Captain Lovel Hodgdon, one of the best known and most successful fishermen on the coast, says the largest hauls of codfish he ever saw taken were taken last spring, within five miles of Eastern Point. He took 60,000 pounds in two days' fishing. For a period of eight weeks the fishermen caught several million pounds.

David Tarr, of the large wholesale firm of James G. Tarr & Brother, says that the large school of codfish which has frequented the coast of late years is due to the earlier efforts of the Fish Commission, and if they will only establish a station here and keep on hatching codfish that the inshore waters will become very prolific, and the shore fishermen in winter will get all the fish necessary to supply the markets and make good paying voyages. Captain J. W. Collins, who has had much experience in this matter, and whose opinion in all matters appertaining to fishing is second to none, (as will be seen by the following letter which he recently received on his return from his summer exploration around the coast of Newfoundland, Gulf of St. Lawrence, etc.) believes that the artificial propagation of codfish can be successfully accomplished, and that it will be of great benefit to the fishermen.

Col. McDonald, who is in charge of propagation and distribution for the Commission, is very desirous of establishing a hatchery on Ten Pound Island to be used for the propagation of all kinds of sea fish. We can see no reason why this place should not be one of the principal stations in the United States for fish hatching, since it possesses facilities unsurpassed. Sea fish of all kinds for hatching purposes can be readily secured at the proper seasons of the year, when in spawning condition. The advantages which may accrue to our fisheries by the combined scientific and practical work of the U. S. Fish Commission have often been demonstrated, but perhaps never more forcibly than during the present year.

Captain Collins in the Grampus sailed from here early in the season for an exploration around Newfoundland and Labrador with a view to locate the whereabouts of the mackerel, and on his return was asked by many his opinion with regard to the prospects found. After giving his views he received the following letter which explains itself:

GLOUCESTER, Mass., Sept. 29, 1887.—*Capt. J. W. Collins:* Dear Sir—You may remember, about the first of this month we asked you if you could give any information about the prospect of mackerel in and about the Gulf of St. Lawrence and adjacent waters. You said during your trip there in the schooner Grampus, from which you had just returned, you had observed very carefully all signs tending to show the presence of mackerel in any considerable quantity, and had not found any; and furthermore, you had kept a drag net out all the time you were sailing, and had found absolutely no food for mackerel, until upon your return trip you had got nearly home, on Brown's Bank, or this side of it, and there you found food in large quantities, which you considered to be a reasonably sure prospect, if mackerel were caught at all, they would be caught upon our own shores; which judgement has proved accurate and very valuable. On the 7th of September, a few days after our conversation with you, we received a dispatch from Capt. Cameron, of our schooner Gatherer, at Souris, P. E. I., asking for instruction how to proceed, saying the prospect looked to be fair there. Acting upon your opinion, we directed our captain to come home immediately. He started, and seven days later he caught 350 barrels of mackerel eight miles from Eastern Point, in Massachusetts Bay, and they were sold for $18 per barrel. The 130 barrels he had on board, caught in Bay St. Lawrence, were sold for $13.50 per barrel, and he had been ten weeks catching them. We think the researches and experiments of the U. S. Fish Commission have been of great value to us in many ways and to the country at large. The matter of hatching salt-water fish will eventually help very materially in reducing the cost of fish to the consumers. Permit us, in conclusion, to express our hearty sympathy with the work of the U. S. Fish Commission, and you in particular, as a representative of it, for your earnest and accurate work in this department. Yours truly, ROWE & JORDAN.

The large shore fleet which was engaged last spring in codfishing, and the great quantities of fish taken attracted much attention, for it was wondered by the most experienced fishermen how such a school of fish should be seen off Cape Ann. The following are a few of the many vessels and their daily catches, which are unparalleled in the history of the fishing on this coast: Schooner Abby A. Snow with 12 men in one day caught 44,000lbs., four miles off Eastern Point; schooner Rising Star, 10 men, 39,000lbs.; schooner Dixie, 8 men, 40,000lbs.; Breeze, 4 men, 20,000; Teddie, 3 men, 10,000lbs., and this increase was presumably all from the work of the Fish Commission. The result of such work as has been mentioned is doubly beneficial; not only is the producer benefited, but the consumer of fish is enabled to obtain a finer food at less expense than now, when vessels must go hundreds of miles from home ports to secure the finny treasures of the ocean.

HAGERSTOWN, Md., Nov. 6.—A new factor has been introduced into Washington county politics. Thursday night, while the Republicans were holding an outdoor political meeting in Clear Spring, a skunk, attracted from his mountain haunts by the startling assertions made by the orators, put in an appearance, and with little ado put an untimely end to the meeting.—*Baltimore Sun.*

The Kennel.

FIXTURES.

DOG SHOWS.

Dec. 6 to 8.—Third Annual Dog Show of the Central Berkshire Poultry, Pigeon and Pet Stock Association. W. T. Webster, Secretary, Lee, Mass.

Dec. 6 to 10.—Second Annual Dog Show of the Northern Illinois Poultry and Pet Stock Association, at Rockford, Ill. W. J. Hamley, Superintendent.

Dec. 14 to 16.—Third Annual Dog Show of the Winsted Kennel Club. Frank D. Hallett, Superintendent, Winsted, Conn. Entries close Dec. 3.

Jan. 23 to 27, 1888.—First Dog Show of the Agusta Pet Stock and Poultry Association, at Agusta, Ga.

Feb. 21 to 24, 1888.—Twelfth Annual Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent.

April 3 to 6.—Fourth Annual Dog Show of the New England Kennel Club, at Boston, Mass. J. W. Newman, Secretary.

FIELD TRIALS.

Nov. 15.—Robins Island Field Club's Annual Trials on the club grounds, Robins Island, New York.

Nov. 21.—Ninth Annual Field Trials of the Eastern Field Trials Club, at High Point N. C. W. A. Coster, Secretary, Flatbush, Kings County, N. Y.

Dec. 12.—First Annual Field Trials of the American Field Trials Club, at Florence, Ala. C. W. Paris, Secretary, Cincinnati, O.

Jan. 10, 1888.—Second Annual Field Trials of the Texas Field Trials Club, at Marshall, Tex. W. L. Thomas, Secretary, Marshall, Tex.

Jan. 16.—Fifth Annual Field Trials of the Pacific Coast Field Trial Club, near Kingsburgh, Cal. N. P. Shelden, Secretary, 320 Sansome street, San Francisco, Cal.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **5492.**

WESTERN FIELD TRIALS ASSOCIATION.—Kansas City, Mo., Oct. 30.—*Editor Forest and Stream:* I have received this morning the delayed entry of an additional dog for the All-Aged Stake, which please add to your list, namely, Mr. L. B. Sugg's lemon and white setter Bun Roy (San Roy—Queen Bess), 2yrs. 7mos.—R. C. VAN HORN, Secretary and Treasurer.

ROBINS ISLAND FIELD TRIALS CLUB.—The annual field trials will be held Nov. 15. The judges invited to serve are Judge C. E. Pratt, Mr. Jacob Pentz and Col. L. C. Bruce. There will be 2,000 new quail on the preserve by the 10th of this month and another thousand will be put out after the trials.

AMERICAN FIELD TRIALS ENTRIES.

FOLLOWING are the entries for the All-Aged Stake and Champion Stake of the American Field Trials Club trials next month. There are 41 setters and 9 pointers, a total of 60, distributed thus: Arkansas 2, Connecticut 1, Georgia 2, Kentucky 1, Maine 1, Manitoba 1, Mississippi 3, Missouri 1, Montana 1, New Jersey 10, New York 2, Ohio 8, Pennsylvania 2, Tennessee 17, Virginia 2, Wisconsin 6.

SETTERS.

JIM GLADSTONE (John Dress, Little Rock, Ark.), black, white and tan dog, March, 1885 (Paul Gladstone—Busy Bee).

MAY (James N. Maclin, Keeling, Tenn.), black, white and tan bitch, May 2, 1886 (Gath's Mark—Dell).

RENA (Chas. F. Loudon, Cincinnati, O.), black and white bitch, Feb. 2, 1885 (Ben Hill—Joe W.).

NOBLE C. (Walter H. Drain, Clarksville, Tenn.), black, white and tan dog, April 22, 1884 (Count Rapier—Belle of Hatchie).

ROD GEM (L. A. Boli, Hamilton, O.), black, white and tan dog, Oct. 18, 1885 (Roderigo—Gem).

BREEZE GLADSTONE (Wm. A. Buckingham, Norwich, Conn.), black, white and tan dog, June, 1885 (Gladstone—Sue).

EFFIE HILL (A. L. Malone, Palo Alto, Miss.), black, white and tan bitch, Dec. 26, 1885 (Prince B.—Donna).

ROCKS (W. W. Titus, Montpelier, Miss.), black, white and tan dog, June, 1882 (Lava Rock—Leddersdale).

DONA TELLO (Edward Hyde, Decatur, Ga.), orange and white dog, May, 1885 (Baden Baden—Grover's Daisy).

DAISEY F. (Dudley & Fisher, Nashville, Tenn.), lemon and white bitch, September, 1883 (Gleam—Dean).

DAD WILSON (J. Shelley Hudson, Covington, Ky.), black, white and tan dog, Aug. 9, 1884 (Cambridge—Dido II.).

KEYSTONE (S. L. Boggs, Pittsburgh, Pa.), black, white and tan dog, June 27, 1885 (Gladstone—Sue).

TASSO (Jerry Cockrell, Memphis, Tenn.), black, white and tan, October, 1883 (Startle—Nellie C.).

GAY GLADSTONE (B. P. Holliday, Prairie Station, Miss.), orange and white bitch, Dec. 26, 1884 (Gladstone—Florence).

MANDAN (R. B. Morgan, Akron, Ohio), blue belton dog, June, 1883 (Count Noser—Lola).

KING NOBLE (J. I. Case, Jr., Racine, Wis.), blue belton and white dog, Aug. 28, 1883 (Count Noble—Rosalind).

KING'S MARK (J. I. Case, Jr.), blue belton and white dog, April 12, 1886 (King Noble—Belle Belton).

DIXIE BELTON (J. I. Chase, Jr.), black and white bitch, March 27, 1885 (Dick B.—Belle Belton).

KING'S DAN (J. I. Case, Jr.), blue belton dog, July 26, 1885 (King Noble—Elsie Belton).

BESSIE B. (Leredo Kennel, Racine, Wis.), blue belton bitch, July 25, 1885 (King Noble—Elsie Belton).

BOHEMIAN GIRL (Leredo Kennel), black and white bitch (Count Noble—Mollie Belton).

JUNO A. (Memphis and Avent Kennel, Memphis, Tenn.), black and white bitch, May 14, 1882 (Druid—Ruby).

CASSIO (Memphis and Avent Kennel), black, white and tan dog, April 28, 1885 (Count Noble—Lizzie Hopkins).

JEAN VAL JEAN (Memphis and Avent Kennel), black, white and tan dog, March 7, 1885 (Mingo—Twin Maud).

ALLIE JAMES (Memphis and Avent Kennel), lemon and white bitch, March 7, 1885 (Mingo—Twin Maud).

CHANCE (Memphis and Avent Kennel), black, white and tan dog, June 1, 1885 (Roderigo—Bo-Peep).

NAT GOODWIN (Memphis and Avent Kennel), black, white and tan dog, June 1, 1885 (Roderigo—Bo-Peep).

OLLIE S. (Memphis and Avent Kennel), black, white and tan bitch, March 7, 1885 (Paul Gladstone—Lottie).

NELLIE CAMBRIDGE (Richard Dorman, Cincinnati, Ohio), black, white and tan bitch, June 18, 1885 (Ricket—Daisy Cambridge).

PRINCE (D. E. Rau, Lawrenceburg, Tenn.), black and white dog (Jeff—May).

CYCLONE (H. A. Renfroe, Cole City, Ga.), black, white and tan dog, Jan. 1, 1884 (Lightning—Dora Royal).

MAY M. (R. B. Morgan, deputy, Akron, O.), black, white and tan bitch (Duke—Fannie).

BUN ROY (L. B. Saggs, Memphis, Tenn.), liver and white dog, March 30, 1885 (San Roy—Queen Bess).

DUKE (A. S. Bishop, Pittsburgh, Pa.), black, white and tan dog (Doncaster—Flirt).

GLOSTER (James L. Breese, Tuxedo Park), black, white and tan dog, July 24, 1884 (Dashing Rover—Trinket).

NORTIER (John W. Besserer, Helena, Mont.), no particulars given.

DAN (W. B. Shattuc, Cincinnati, O.), liver and white dog, Aug. 9, 1884 (Cambridge—Dido II.).

COUNT PARIS (C. W. Paris, Cincinnati, O.), liver and white dog, May 2, 1886 (Count Noble—Dido II.).

CAMBRIA (Thos. Johnson, Winnipeg, Manitoba) blue belton bitch (Cambridge—Pet Laverack).

JIM BLUDSOE (J. W. Renfroe, Atlanta, Ga.), dog, Dec. 3, 1883 (Baden Baden—Daisy Dot).

POINTERS.

SPOT (J. B. C. Lucas, St. Louis, Mo.), liver and white dog, 1883 (Drake—Fan).

JOE PAPE (John Dress, Little Rock, Ark.), black dog.

BEAU OF PORTLAND (H. F. Farnham, Portland, Me.), black, white and tan dog, Nov. 18, 1885 (Graphic—Zitta).

PAP SMIZER (Chas. Wheaton and Gustave Sander, Dayton, O.), liver and white dog, July 24, 1884 (Meteor—Diana).

DUKE OF HESSEN (F. R. Hitchcock, New York), liver and white dog, May 9, 1885 (Luck of Hessen—Blarney).

GRAPHIC (Graphic Kennels, Netherlands, N. J.), liver and white dog, April 15, 1881 (Bonus Sancho—Fursdon Juno).

BRACKET (Graphic Kennels), liver and white dog, Feb. 8, 1884 (Graphic—Leach's Bloomo).

LAD OF BOW (Graphic Kennels), liver and white dog, March 19, 1884 (Graphic—J. Price's Climax).

BEPPO III. (Graphic Kennels), liver and white dog, May 26, 1884 (————Meally).

GRAPHIC III. (Graphic Kennels), liver and white dog, Feb. 18, 1886 (Graphic—Leach's Bloomo).

MEALLY (Graphic Kennels), liver and white bitch, July 12, 1881 (Statter's Pat—J. Price's Climax).

REVEL III. (Graphic Kennels, Netherlands, N. J.), liver and white bitch, Feb. 2, 1883 (Graphic—Beryl).

LASS OF BOW (Graphic Kennels, Netherlands, N. J.), liver and white bitch, March 19, 1884 (Graphic—J. Price's Climax).

BLOOMO (Graphic Kennels, Netherlands, N. J.), liver and white bitch, August, 1881 (Bang II.—Weppel's Belle).

NICK OF NASO (C. J. Peshall, Jersey City, N. J.), liver and white dog, April 15, 1885 (Naso II.—Pettigo).

ROD (W. B. Stafford, Trenton, Tenn.), liver and white dog, 1884 (Meteor—Dell).

REX (W. B. Stafford, Trenton, Tenn.), liver and white dog, 1886 (Mainspring—Dell).

JOY OF PRINCE (J. A. Purcell, Hickory Grove, Va.), liver and white bitch, Aug. 23, 1885 (Purcell's Flockfinder—Ion).

CHAMPION STAKE.

GATH'S MARK (James N. Maclin, Keeling, Tenn.), black, white and tan setter dog, May 23, 1884 (Gath—Gem).

RICHMOND (James E. Gill, Franklin, Pa.), liver and white pointer dog, July 27, 1883 (Vandevort's Don—Beulah).

RODERIGO (Memphis & Avent Kennels, Memphis, Tenn.), black, white and tan dog (Count Noble—Twin Maud).

C. W. PARIS, Sec. and Treas.
CINCINNATI, O.

INDIANA FIELD TRIALS.

THE entries for the Indiana Kennel Club's first annual trials at Bicknel, Ind., Nov. 7, came too late for publication last week. The list is as follows:

ALL-AGED STAKE.

CHANGE (S. H. Socwell), black and white setter dog (Dashing Don—Daisey Starlight).

TOPSY W. (M. R. WILLIAMS), black, white and tan setter bitch (Sweep—Lady Pape).

LARK P. (Curtis Wright), black, white and tan setter dog (Glen—Topsey S.).

JIM BLAINE (Joseph Becker), orange and white setter dog (Don Nilson—Nellie B.).

POLLY II. (J. B. Stoddard), white and black ticked setter bitch (Josh Whitcomb—Polly).

BEN LANIER (Harry S. New) lemon and white pointer dog (Jo Bowers— ——).

KING DON (King Don Pointer Kennels), seal brown, white and ticked pointer dog (Vandevort's Don—Vandevort's Luck).

GLADDES (P. Tindolph), black, white and tan setter bitch (Gladstone—Sanborn's Nellie).

PENDRAGON (S. H. Socwell), black, white and tan setter dog (Count Noble—Floy).

JACK W. (E. M. Usher), orange and white setter dog (Sargent—Eva).

THE DERBY.

ZETTA KING DON (J. B. Carnahan) lemon and white pointer bitch (King Don—Queen Faust).

GLENNIS (H. A. Comstock), red Irish setter bitch (Chief—Grace Glencho).

QUEEN OF TENNESSEE (W. A. Evans), black, white and tan setter bitch (Gath's Hope—Freda).

CHERRYSTONE (Devonshire Kennels), liver and white pointer bitch (Trinket's Bang—Pearlstone).

LOU ROY (Royal Robinson), liver and white setter bitch (San Roy—Nettle).

DAISY ROY (Royal Robinson), liver, white and tan setter bitch (San Roy—Nettle).

DASH (John A. Hunter), red Irish setter dog (Royal C.—Belle).

SHOT (Joseph Bicker), red and white cross-bred setter dog (—— —Nellie B.).

LINK (Geo. Sluthour), liver and white pointer dog (pedigree not given).

ROSE (Harry S. New), red Irish setter bitch (Elcho— ——).

A RACCOON HUNT.

THERE may be more invigorating and health-preserving sport than hunting the raccoon, but there certainly is nothing fraught with so much danger. Our party of five left Philadelphia last week bound for Peach Bottom, an isolated village on the banks of the Susquehanna, for a week's gunning. We had scarcely reached our destination and washed our hands at the Hotel de Bostick before the subject of coon hunting was broached, every one expressing themselves favorable to a trial. It was impossible to go that evening, so a date was fixed ts suit all parties and the matter dropped until it was time to start. How we occupied our time between the proposition and the date fixed is scarcely worthy of mention, suffice to say that not being experienced gunners, we traversed miles of hills and woodland without bagging much of the coveted game. Anyhow, the night arrived for the discomfiture of the coons. Upon the man arriving with three of the best foxhounds we have seen for some time, we prepared ourselves for the chase.

At about nine o'clock we started out, nine in the party. The night was intensely black and only for the useful lanterns which we had there would probably have been some trouble ere we had traversed 100yds., the roads being a little more rugged than our main thoroughfare of Philadelphia. After walking about a mile we were brought to a stand by the owner of the dogs calling a halt. In the quiet of the night he had heard the distinct howl of his favorite hound yelping as only foxhounds can when on a hot trail. After carefully listening we were informed that the dogs had treed a coon about half a mile away and nearly at the top of a mountain. The next question was how to reach them. The hill where we stood was certainly too steep, being nearly perpendicular, so walking a little distance we found a more inviting entry and made a start upon hands and knees, carrying our lanterns on our arm. We had not proceeded many steps before one of the party missed his footing and in less time than it takes to tell it, was precipitated to the bottom again. However, not being fatally injured he mad another attempt and finally caught up to the party, using language "not suitable for publication." With several scratches from briers, stabs from locust thorns, we finally reached the dogs at the bottom of a sycamore at least 60ft. high. There was no doubt as to the coon being here, as these dogs are never false. The youngest of the party then ascended the tree while the dogs at once stationed themselves at intervals a little below the tree waiting for their prey to be shaken down.

In some cases the tree is cut down, but not where it is accessible by a good ascensionist. When near the top the boy located the object of his search, and gave warning to the people below to be on their guard. He then reached the limb whereon Mr. Coon was reposing. With a couple of good shakes the animal made a leap downward, striking in his descent an old limb, which snapped off and caused quite a discomfiture among the dogs, for they followed the broken limb instead of the coon, and the coon gained a fair advantange in the run. The dogs trailed him for about a mile, finally driving him to earth at the foot of some rocks, in a dangerous place for the party to venture. In fact, had it been daylight instead of night, I would not have risked my neck for the best farm in the locality, and I can safely answer for the rest of our party. With the aid of pipes and cigars we endeavored to drive our friend from his earthly home with smoke, but he evidently was used to fumigation or had another exit, for our efforts were fruitless and the hole was abandoned.

After a tramp up hill and down dale for another hour, the dogs all this time working assiduously, we heard a word of warning from the oldest of the three to the effect that a second coon had been driven to a tree. The hill we climbed this time was even worse than the first, being thickly overgrown with laurels and locusts. However, we managed, after an unusual amount of exertion on the part of the fat man of the party, to land at the dogs, who were barking at an old dead tree with two butts, and both of them hollow. For some unlucky reason we started to smoke the most inviting trunk, thinking the coon must be there, but he evidently had escaped, much to the dissatisfaction of the dogs, who knew more about it than we did. In the attempt to smoke the tree the lieutenant of the party had set fire to it, and do all in our power we could not extinguish the flames. The hunt now looked as though it would terminate in a forest fire, the tree being surrounded by dead leaves and timber; but with the shrewdness of old foresters, our chaperone took charge of the situation and ordered a space cleared all around the tree, and then awaited developments. The sight in itself was grand, but the outlook was not so rosy, the idea of incendiarism striking us in our weak points. Luckily, however, we prevented further damage after two hours' hard work.

Some of the most nervous of the party wanted to give up the chase at this point, but the majority persuaded them to continue, so on we went. We had traveled now upward of ten miles, which would surely be equal to fifteen along good roads; but bent on killing a coon we proceeded. In the course of half an hour the captain heard the dogs and was informed by their tonguing that they had treed a possum. When half a mile away the owner of the dogs could tell by the tongue what they were after, coon, fox, possum or polecat; and could easily define whether it was holed or treed.

We ascended the hill and sure enough the possum was treed. To make sure of this fellow we had to shoot him, the tree being too small to climb. The gunshot struck his hindquarters and down he came; but no sooner had he done so than away he went like the wind, followed by the dogs who grabbed him before he had gone 30yds. and soon had him disemboweled. We descended the hill with much difficulty, our lieutenat coming down in a sitting posture, from the effects of which he is to-day eating his meals standing up.

The success we had attained in killing a possum seemed to appease our appetite for coon hunting, so we decided to return home along the Peach Bottom Railroad. We were now about three miles from the hotel at 2 o'clock in the morning with our lights burnt out. This state of affairs looked rather gloomy with three miles of narrow-gauge between us to tramp on, the Susquehanna on one side and deep precipices on the other. However, we concluded to start, and any one who has tramped on a narrow-gauge railroad at 2 o'clock in the morning can imagine our discomfiture and sympathize. We reached the hotel about 3 o'clock and were welcomed by the cook, who, always on the lookout to please, had prepared us some quail on toast. The remainder of our trip was spent gunning for birds with fair success. We could advise our readers to give this place a trial in a month's time for ducks, as they are very plentiful. S.

PHILADELPHIA, Pa.

PERFORMING WOLVES AT THE WESTMINSTER AQUARIUM.

THE directors of this popular pleasure resort have provided a good many rare shows for the amusement of the public, but nothing so perfectly strange and new has been produced as Mr. Rudesindo Roche's troupe of trained wolves. Performing dogs are plentiful enough, we have a troupe of eleven horses at the Avenue Theatre, we had Gougou and his learned pig at the circus last Christmas, elephants, too, and all kinds of wild animals have been trained to do tricks for public entertainment, but wolves are something quite new in this line. The afternoon performance that I attended at the Aquarium I learned afterward is not so complete as that gone through in the evening. When I arrived Mr. Roche was in the middle of his "show." A high railing is fixed round the Aquaria stage, and the cart containing the sixteen wolves, each in a separate compartment, is wheeled into this ring. The proprietor, attired in a military costume, directs his pupils by voice, and carries for his protection nothing but a couple of whips, one of the short riding description, and the other like an ordinary driving whip. The first impression the sight of these creatures makes upon a doggy man is their resemblance to a smooth gray collie with prick ears. They go through all the regular tricks of the ring—standing on chairs, leaping over hurdles, etc. I was rather struck with the surly manner in which they did everything—there was very little of that pleasure in their work that dogs exhibit so strongly. The whip has to be brought into play very frequently, but never unnecessarily. One can easily see that these savage brutes, however well trained, can hardly be called tamed. A snarl accompanies everything they do, and when rated they crouch like a beaten dog, curl up their lips, and snap viciously at the whip—and emit a very canine yelp when punished. They know perfectly well what they are told to do, but they have to be made to do it. Some of them are less ferocious; one or two are even friendly. I noticed also that when Mr. Roche praised these they wagged their tails with pleasure and "grinned" like collies. The effect is very uncanny as they trot round the inclosure, with light, stealthy, springy steps, and their shifty eyes watching the master, who gives his commands with sharp precision, and they obey the command with military quickness. Two of them mounted a table and then clambered up one on each of Mr. Roche's arms and balanced themselves there, at the same time licking his face; he then let them take meat out of his mouth. The last turn is putting his head into the mouth of one of them. When the performance is at an end the pack are kenneled one by one. In the cart are two rows of dens, one above the other, and eight in each; at a distance they look like lockers with the doors open. Each wolf, as he is called by name, springs into his compartment and the door is closed. The last, when summoned, took no notice of the order, but rolled about on his back just like a dog playing. When Mr. Roche prodded him with his foot and told him get up, the wolf made an angry snap at his master, who immediately stooped down, and grasping the vicious beast by the neck, picked it up, carried it across the stage and thrust it into its den. Mr. Roche afterward informed us that he had received a remonstrance from some well-meaning people about using the whip too freely, but taking the ferocious and treacherous nature of the creatures into consideration, we must admit we were surprised to see so little of it. A severe flick is required to make an impression, as their coat and hide are very thick. It requires extraordinary force of will to keep the lot in order when they are all loose on the stage. During the second representation at the Aquarium, the lot started fighting. Mr. Roche was not able to restore order until one of the animals got so terribly mauled that it expired shortly after, and their owner did not escape without several severe bites on his hands, but a few wounds more or less do not trouble him in the least, his arms, legs, body and face are covered with scars inflicted by his lupine friends.

Having asked the superintendent of the building, Mr. Lingley, for an introduction, I was astonished on being presented to Mr. Rudesindo Roche to find the great man of a stature much below the average height. He laughed when I remarked upon this to him, and said it was only the effect of his military "make up" which gave him on the stage the appearance of being a tall man. However, what he lacks in height Mr. Roche makes up in breadth and general massiveness. He speaks many languages and becomes very agreeably communicative when we struck common ground—dogs. "Why," he said, smiling, "it was through dogs that I became a public performer as a tamer of wild animals. I will tell you all about it. In the first place, I am a Spaniard, but I speak German well, from having been established some years in Hamburg as a wine merchant; that is really my business. I was always an animal lover, and in Hamburg I owned several big Ulmer dogs, what you call boarhounds, I think, and a few horses. I trained all of them, dogs and horses, to such perfection that I became the talk of the town. When, therefore, a well-known circus came to us, the lion tamer gave me a call and appeared struck with the control I had over my animals. I told him I could train any animal. He immediately offered to bet me £250 that he would name an animal I could not. I accepted the bet, and he named the wolf! I confess I felt astonished, and when I went to the Hamburg Zoo to have a look at the breed, I saw I had my work cut out to train these uneasy, restless beasts. Well, I started with five wolves, which I obtained from Mr. Carl Hagenbeck, the animal dealer in Germany. He got them from Russia. They were about eighteen months old. Whether I won my bet? Certainly I did; in one year they knew as much as my dogs. I had done this for my private satisfaction, but you can imagine my tame wolves were talked about, and the next thing in my history is when the Hamburger *Weinhändler* makes his first public bow as a wild-animal trainer, dressed in a semi-military uniform, and surrounded by his wolves at the Reichshalle in Berlin. That was five years ago, and my contract with the management was £150 for fourteen days' engagement. Before I was allowed thus to make public exhibition of myself, I had been obliged to conquer strong domestic prejudices against the stage, and so forth. When the curtain went up, I felt nervous for the first time in my life—that was stage fright—but it soon wore off as the loud plaudits approved each part of the performance; the success was enormous. When the curtain fell I cried with delight. I remained in Berlin five months, and from then abandoned the wine trade for my new career. Since that I have appeared in Paris, Moscow, St. Petersburg, Vienna, etc. I also got together a regular circus of my own, and six trained stags that I then owned were greatly admired. In Russia an incendiary set fire to my circus, and all was burnt, vans, properties, horses, stags, wolves, everything!" "What did you do then?" I asked. He gave up the circus idea, and started off to Siberia and caught twenty-seven wild wolves, but six of them died *en route* from the bites they received in fighting with one another. Asked how long it took him to train a wild wolf, Mr. Roche replied he had taught four fresh arrivals to perform in public within twenty-nine days. I expressed my astonishment upon hearing this, and also my wonder that with his small physique he was able to control such savage brutes, who appear to be always on the alert for a chance of attacking him. "It is evident you don't do it by force," I said, with a smile. "Ah," replied Mr. Roche, "you are only half right. Look here," and he rolled up his sleeves, exhibiting to my astounded gaze the most magnificent arm I have ever seen on a man; even Jem Smith, the doughty champion of the prize-ring, could not show against this enormous mass of muscle.

"That is one of my secrets," said the tamer, enjoying the surprise I could not hide, "and now you will understand why I can so easily support a wolf weighing about 100lbs. on each arm outstretched. My strength is enormous; but you want to know my process—it is kindness backed by force. This is how I proceed with the raw material. I carry the wild beast in his box into an inclosure, and then knock the lid off. As he crawls out I face him with nothing in the shape of protection but gloves on my hands. The wolf, you know, is a crafty coward, and seldom commences an attack. If the beast when he sees me, walks away with his head down and looking furtively at me, I know at once he is good-tempered, that is, for a wolf; but if he stands crouching and curling his lips, I know I have got a job before me. But whichever they are it is necessary for my purpose that they should fly at me, in order that I may have the opportunity to show the wolf that I am his master. This is the first lesson and the key to all that follows. I endeavor to make a good impression at the start. Well, the wolf crouches for his spring; I stand waiting with my hands ready; as he jumps I catch him in the air by the throat, and thus holding him, clutched with a grip of iron, his jaw forced open by the muscular strain, I draw his face slowly to mine and bite his snout, and keep my teeth there till he whines, when I fling him away, and with angry words and scowl order him into his cage; the bewildered, baffled and beaten creature sneaks away like a whipped cur. After that the wolf is my humble, if uncertain servant. Though some of them once bitten are not twice shy, and require a second dose; the rest of the training is the same as with other wild animals. I never use the whip in training. Twice a year, of course, the wolf is subject to sexual disturbances, becomes savage and has to be 'bitten' again."

"Owing to their treacherous character," I said, "I presume you can place no reliance upon them, and so you are always more or less in danger during the performance?" "It is that which makes my show particularly acceptable to the public," replied Mr. Roche, smiling. "You are bitten sometimes, I suppose?" "Bitten, I should think so; look, here and here," pointing to long scars on his face and hands, "and all over my body." "Have the whole lot ever turned upon you during a performance?" "Yes, once; the management one evening informed me that the Emperor of Austria was coming, and having heard so much of His Majesty's prowess as a sportsman, I devised a special feature for him. The cage was wheeled into the iron-railed-in ring, and I walked into the ring covered with strips of raw meat, freshly cut, wound round my arms, flung over my shoulders and all about my body; at a signal the doors of the dens flew open, and the whole of the wolves leaped out, smelled the flesh, and not heeding my yells, flung themselves upon me. I fought desperately for a few moments and then swooned. The spectators were horror-struck. When my man saw me on the ground he rushed in and attacked the wolves. They immediately left my prostrate form and turned upon him. Just then I came round, and, struggling to my feet, went to my man's rescue. How ever we both got out I shall never realize. I fainted again outside, and was in bed many weeks before the scars, which were of a shocking nature, healed up. My man was also badly bitten. The Emperor, I must tell you, had me treated with the greatest kindness, and was much upset by the fearful sight he had witnessed."

After listening to this blood-curdling account, I did not jump at Mr. Roche's invitation to go and inspect the wolves behind the stage; still I went, as I wanted to see their mouths and the whips he uses. The latter are of the ordinary kind, there is no spike fixed to the end, as some people have supposed, when they saw Mr. Roche turn the butt to a wolf snapping at him; the animal then bites into the handle, and the tamer at once takes it by the throat. The whips are covered with the marks of their teeth. The trainer always wears gloves, because if bitten, the tooth enters clean into his flesh, the leather of the gloves cleaning off any dirt or foam. Their teeth, especially the long side fang teeth, are terrible to contemplate. I felt the thick dense mane of one of them, and have mentally congratulated myself that I had not lost my hand over it, was turning to quit the stage when Mr. Roche said, "Ah! but we have not seen my bear-dog yet. Bring him along," this to his servant, who dragged forth a large heavy animal of the German mastiff kind. It has a short red coat, a big unshapely head, and, as it is still growing, may make up in height to equal its bulk. Its owner has taken it into the ring several times, but the poor beast gets punished too much by the sly bites the wolfs give him. Mr. Roche tells us the wolves eat 120lbs. of horseflesh a day. He never feeds them himself, for the same reason, he said, that he does not like very young wolves to begin with; they get too friendly and familiar, and will not pay attention, and when spoken to angrily just fawn about his legs. Mr. Roche is now teaching his pupils to sing, and in saying this and good-bye he slyly mentioned that he did not think the vocal artistes at the Aquarium like it much, as the wolves have not the good manners to wait for the chorus.—*G. R. K. in the Stock-Keeper.*

THE RICH AND RARE AND SANDY JIM RACE.—Hutchinson, Kas., Nov. 22, 1887.—*Editor Forest and Stream:* By request I send you particulars of the side-race which was to have been run on the grounds of the American Coursing Club the week following the coursing meet, between Dr. Q. Van Hummel's dog Rich and Rare and Mr. M. E. Allison's dog Sandy Jim. On Saturday, Oct. 22, Mr. Allison gave me $10 and told me to go to Dr. Van Hummel and arrange a match for $20 a side, between Rich and Rare and Mr. Allison's Terry, to be run the following Monday, Mr. H. C. Lowe to judge; best three out of five courses; stakes to be $50 if preferred. Dr. Van Hummel agreed to run Terry on Monday for $20. At my request, Mr. W. W. Carney (the owner of the ranch where the club grounds are situated) was given Mr. Allison's $10 and chosen to act as stakeholder; and

Mr. Allison deposited his additional $10 with Mr. Carney a moment later. When Dr. Van Hummel was approached during the afternoon for his $20, he stated that he had made a mistake; that he did not want to run Terry, because there was no glory in beating him; but that he would like to run Sandy Jim, the last year's champion. Dr. Van Hummel repeated this to Mr. Allison in my presence. Mr. Allison asked him what stakes he wanted to run for, and when he wanted to run. Dr. Van Hummel named $50, and any day the following week. Mr. Allison named Friday. Both gentleman agreed that $20 should be the forfeit. Dr. Van Hummel deposited $10 with Mr. Carney that afternoon, and said he would deposite the other $10 on the signing of the papers that night. At the signing of the papers Dr. Van Hummel stated that he understood the forfeit was to be $10. Mr. Carney refreshed his memory, and he made up the $20 forfeit and signed the papers. Mr. Lowe, at some personal inconvenience, stayed over to judge the race. On Friday Mr. Allison and Mr. Lowe were at Great Bend. I was not there, but am informed that Dr. Van Hummel put his dog into the wagon and made every apparent preparation for the race. Mr. Allison and Mr. Lowe remarked to him that if he did not mean to run he would save the judge and opponent a long ride and their livery bill by letting them know it. Mr. Lowe and Mr. Allison went on out to the grounds. Some time after they were gone Dr. Van Hummel sent word to their hotel that he would not run. Mr. Lowe and Mr. Allison expressed themselves as feeling such treatment shabby. Mr. Lowe had been at some trouble to stay over. I do not know what reason Dr. Van Hummel assigns for not running. I have no interest in that, as I simply state facts and this is my last reference to the matter. But I know that Mr. Allison told me that Sandy Jim was lame at the coursing meet; that he put the side race off till Friday to give him a chance to recover, and that he would run him Friday, lame or any other way. I do not think Sandy Jim was so lame on Friday but that he could have interested Rich and Rare. I am sorry the race was not run. I should have liked to see it. But we all agreed that we could never see it. That is the only reference I would draw from the above facts; and this quite closes my interest in the matter. Possibly sportsmen would like to know these facts and to know they are exact. —E. HOUGH.

A RAILROAD DOG.—*Editor Forest and Stream:* While reading Day's "Reminiscences of the Turf" I came accoss the following anecdote: "At Porchester station, between Cosham and Farnham, on the Southwestern Railway, there is a dog to be seen that is quite a character in its way. It is a Clumber spaniel, lemon and white. He gives notice of each stopping train, generally before, but always on the moment of its appearing in sight. On its approach he rises up from the mat where he is generally lying, and trots up and down the platform, wagging his tail and barking continuously. I saw him myself in July last, when long before I could see the train approaching, he commenced barking all along the platform, and ran down the steps to the yard below, and outside still giving tongue as though to warn the passengers of the arrival of the train. The most curious point is, as the stationmaster informed me, that the dog takes no notice of the express trains that do not stop at the station, nor of luggage trains, apparently holding them in contempt and allowing them to pass and repass without any warning. Moreover, he understands that he is not allowed to cross the line, and only very seldom defies the prohibition."—CLUMBER.

HORNELL SILK.—Hornellsville, N. Y., Nov. 6.—*Editor Forest and Stream:* Your correspondent "C." in issue Nov. 3 makes a mistake, champion Hornell Silk is not the champion field spaniel, but he is the champion field trial spaniel of America by default. We challenged any brace in America to run against Silk and Daisy for any amount, on grouse and woodcock. After waiting a year to give all a chance, we claimed the championship.—J. OTIS FELLOWS, Secretary H. S. Club.

THE WINSTED SHOW premium list is ready. The prizes are $5 and $3 in all classes, with $3 and $2 for puppies where provided for. Pointers and setters will be judged by Dr. H. Clay Glover, all other classes by Mr. James Watson. The membership application of the club in the A. K. C. is pending. Secretary is Frank D. Hallett, Winsted, Conn. Entries will close Dec. 30.

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Bessie Bondhu. By Lake View Kennels, Boston, Mass., for white and orange English setter bitch, whelped Aug. 27, 1887, by Gus Bondhu (Dashing Bondhu—Novel) out of Nellie Dale II. (Dash III.—Nellie Dale).

Lou Dale. By Ravenswood Kennels, Boston, Mass., for white and orange English setter bitch, whelped Aug. 27, 1887, by Gus Bondhu (Dashing Bondhu—Novel) out of Nellie Dale II. (Dash III. —Nellie Dale).

Clip Wind'em and Chautauqua King. By F. M. Shelley, Sheridan, N. Y., for blue belton and black and white and ticked English setter dogs, whelped May 5, 1887, by Knight of Snowden (Johnnie Faa—Swan) out of Lady Brighton (Prince Phœbus—Rosey).

Cumberland Kennels. By J. B. Chase, Portland, Me., for his kennels of English greyhounds, pointers and red Irish setters.

BRED.

☞ **Notes must be sent on the Prepared Blanks.**

Daisy Ranger—Spot Dash. J. W. Trantum's (Middletown, Conn.) pointer bitch Daisy Ranger (Ranger Croxteth—Fannie Faust) to Robt. Leslie's Spot Dash (Sir Philip Sydney—Topsy), Oct. 12.

Tinsel—Lucifer (as in præsenti). Blemton Kennels' (Hempstead, L. I.) fox-terrier bitch Tinsel (Bacchanal—Blemton Tansy) to their Lucifer (as in præsenti) (Splinter—Kohinoor), Oct. 26.

Village Belle—Lucifer. Blemton Kennels' (Hempstead, L. I.) fox-terrier bitch Village Belle (Volo—Beauty) to their Lucifer (Splinter—Kohinoor), Oct. 15.

Blemton Gingerbread—Lucifer. Blemton Kennels' (Hempstead, L. I.) fox-terrier bitch Blemton Gingerbread (Spice—Blemton Arrow) to their Lucifer (Splinter—Kohinoor), Oct. 11.

Lady Brighton—Teddie. F. M. Shelley's (Sheridan, N. Y.) English setter bitch Lady Brighton (Prince Phœbus—Rosey) to J. H. Leyman's Teddie ('Ted Llewellin—Marcella), Oct. 25.

Di Vernon—Dublin Scot. J. W. Lippincott's (Philadelphia, Pa.) collie bitch Di Vernon (Robin Adair—Effie Dean) to Chestnut Hill Kennels' Dublin Scot (The Colonel—Jessie), Nov. 5.

Night Thorpe—Dublin Scot. Chestnut Hill Kennels' (Philadelphia, Pa.) collie bitch Night Thorpe (Nullamore—Gem) to their Dublin Scot (The Colonel—Jessie), Oct. 21.

Trix—Desmond. Chestnut Hill Kennels' (Philadelphia, Pa.) Irish setter bitch Trix (Elcho—Fire Fly) to their Desmond (Fresco—Grouse), Oct. 1.

Bonnie Know—Scotilla. McEwen & Gibson's (Byron, Can.) collie bitch Bonnie Know (Red Gauntlet—Bronda) to Chestnut Hill Kennels' Scotilla (Dublin Scot—Flurry II.), Nov. 1.

Helen—Dublin Scot. J. R. Bennett's (New York) collie bitch Helen (Strephon—Mavis) to Chestnut Hill Kennels' Dublin Scot (The Colonel—Jessie), Oct. 16.

Luella—Scotilla. Chestnut Hill Kennels' (Philadelphia, Pa.) collie bitch Luella (Strephon—Mavis) to their Scotilla (Dublin Scot—Flurry II.), Sept. 29.

Jude—Strephon. Mr. Johnstone's (Philadelphia, Pa.) collie bitch Jude to Chestnut Hill Kennels' Strephon (Eclipse—Flurry), Nov. 1.

Queen—Black Prince. Fred Smith's (Jersey City, N. J.) spaniel bitch Queen to A. C. Wilmerding's Black Prince (Benedict—Madcap), Oct. 30.

Beauty—Black Prince. Henry Chapman's (Ridgewood, N. J.) spaniel bitch Beauty to A. C. Wilmerding's Black Prince (Benedict—Madcap), Sept. 29.

Joan—Drake. F. H. D. Viette's (Ottawa, Can.) Clumber spaniel bitch Joan (Flash—Flirt) to Clumber Kennels' Drake (Ben—Joan), Oct. 30.

Heather Belle—Rutland. A. R. Kyle's (South Norwalk, Conn.) collie bitch Heather Belle to Rutland, Oct. 9.

WHELPS.

☞ **Notes must be sent on the Prepared Blanks.**

Pussie. Harmony Kennels' (Covert, N. Y.) beagle bitch Pussie (Ringwood—Beauty), Oct. 14, six (one dog), by A. C. Krueger's Cameron's Racket (A.K.R. 4010).

Princess Ida. Thos. W. Mill's (Montreal, Can.) bulldog bitch Princess Ida (Byron II.—Rhodora), Sept. 25, four (one dog), by his Guillermo (A.K.R. 671).

Media. Blemton Kennels' (Hempstead, L. I.) fox-terrier bitch Media (Arius—Nancy Lee), Oct. 28, four (three dogs), by their Resolute (Result—Diadem).

Rachel. Blemton Kennels' (Hempstead, L. I.) fox-terrier bitch Rachel (Result—Heatherbell), Oct. 10, four (one dog), by A. H. Clarke's Regent (Roysterer—Ransom).

Flora. Cumberland Kennels' (Portland, Me.) pointer bitch Flora (Jeff—Fan), Oct. 23, five (three dogs), by Fred Thompson's Glen (Glenmark—Zanneta).

Madge.—Editor Forest and Stream: In your issue of Oct. 27 the date of the Dublin Scot—Madge litter should be Aug. 4, and not Aug. 14.—ROBT. MCEWEN (Byron, Can., Nov. 2).

SALES.

☞ **Notes must be sent on the Prepared Blanks.**

Festive. White, black and tan fox-terrier bitch, whelped July 29, 1886, by Bacchanal out of Blemton Arrow, by Blemton Kennels, Hempstead, L. I., to Lawrence Timpson, Red Hook, N. Y.

Daze. White, black and tan fox-terrier bitch, whelped June, 1882, by Deacon Pincher out of Diamond Dust, by Blemton Kennels, Hempstead, L. I., to C. Rathbone, Albany, N. Y.

Seminole. White, black and tan fox-terrier dog, whelped Nov. 1, 1886, by Bacchanal out of Safety, by Blemton Kennels, Hempstead, L. I., to Col. L. Kip, New York.

Lady Alice. Lemon and white English setter bitch, whelped June 1, 1887, by Rex out of Betsy, by Robt. Leslie, Lynn, Mass., to Geo. H. Holthum, same place.

Lion III. Fawn, dark points, mastiff dog, whelped Aug. 8, 1886 (A.K.R. 4167), by Dr. Geo. B. Ayres, Omaha, Neb., to C. H. Babcock, Exeter, Neb.

Meg Merrilies. Dark red Irish setter bitch, whelped Aug. 12, 1880 (A.K.R. 2181), by Harry A. Fletcher, Portland, Me., to Isaac B. Chase, same place.

Maud Sarsfield. Red Irish setter bitch, whelped July 4, 1886, by Sarsfield out of Maud II., by Harry A. Fletcher, Portland, Me. to Wm. P. Mills, Baltimore, Md.

Roderick of Roslyn. Sable rough-coated collie dog, whelped June 8, 1887, by Dublin Scot out of Flurry II., by Chestnut Hill Kennels, Philadelphia, Pa., to F. R. Sears, Jr., Boston, Mass.

Lochgarry. Sable and white collie dog, whelped Sept. 5, 1886, by Strephon out of Jersey Lily, by Chestnut Hill Kennels, Philadelphia, Pa., to J. W. Lippincott, same place.

Patty. Fawn mastiff bitch, whelped Feb. 12, 1887 (A.K.R. 5230), by E. F. Woodcock, Lansing, Mich., to Geo. B. Martin, East Jordan, Mich.

Sandycroft Belle. Fawn, black points, mastiff bitch, whelped April 9, 1887 (A.K.R. 4981), by Sandycroft Kennels, Milford, Del., to Geo. Grillivan, West Jefferson, O. Being refused by him, Belle was taken by Express Agent W. H. Tunis, Clayton, Del., to pay charges upon her.

Daisy Bright. Black, white and tan Llewellin setter bitch, whelped April 25, 1887, by Gun out of Lady Bright, by Thos. J. Coffey, Washington, D. C., to Frank Pitzer, same place.

Blanche Sensation. Orange and white pointer bitch, whelped Oct. 28, 1886 (A.K.R. 4046), by Frank Pitzer, Washington, D. C., to Wm. Gunsford, Roanoke City, Va.

Elcho, Jr.—Mollie Bawn whelp. Red Irish setter bitch, whelped June 6, 1887, by Chestnut Hill Kennels, Philadelphia, Pa., to J. B. Blossom, New York.

The Moonstone—Media whelp. White, black and tan fox-terrier bitch, whelped April 8, 1887, by Blemton Kennels, Hempstead, L. I., to C. Rathbone, Albany, N. Y.

Regent Vox—Fret whelp. White, black and tan fox-terrier dog, whelped June 22, 1887, by Blemton Kennels, Hempstead, L. I., to Dudley Winthrop, same place.

Prince (A.K.R. 1968)—Meg Merrilies (A.K.R. 2181) whelps. Dark red Irish setter bitches, whelped May 24, 1887, by H. A. Fletcher, Portland, Me., two to I. B. Chase, same place, and one to N. B. Smith, Syracuse, N. Y.

Bacchanal—Village Belle whelps. White, black and tan fox-terriers, whelped March 3, 1887, by Blemton Kennels, Hempstead, L. I., a dog each to Paul Tuckerman, Tuxedo Park, N. Y., and H. V. R. Kennedy, Lawrence, L. I., and a bitch to Dr. H. S. Quin, Utica, N. Y.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

C. E. B., Riverpoint.—What shall I do for my Newfoundland pup, 4½mos. old, very large for his age and quite fat, wants to have an emiction every minute and passes a great deal? Ans. Give the puppy a teaspoonful of sweet spirits of nitre in a little water three times daily. Keep bowels in good shape.

D. M. P., Vicksburg.—A small terrier has been sick for a week or more. The dog shivers while asleep, frequently rests his head on his front paws and stands in that position, has a distressed look and is in pain, has fallen off in flesh considerably. Ans. Dog has catarrhal inflammation of bowels. Give 5 drops of Fowler's solution of arsenic night and morning and diet on milk. Give teaspoonful of brandy night and morning and a very little chopped raw meat mixed with the white of a raw egg.

J. R., Providence.—A setter bitch has had two kinds of worms for the past five months, one about 3in. long, the other ½in. She has a great appetite and is well fed three times a day, but is very thin. Ans. Give the bitch two tablespoonsful of castor oil. After four hours give 30grs. of powdered areca nut made into a large pill or bolus with lard. Diet the bitch for twenty-four hours before and after treating, giving nothing but milk. A purge of oil may follow four or six hours after the areca nut.

Rifle and Trap Shooting.

Address all communications to the Forest and Stream Pub. Co.

OUR RIFLE AND TRAP COPY was stolen this week by some thief at the present moment unknown; and the indulgence of readers of this department is asked.

RANGE AND GALLERY.

LEOMINSTER, Mass., Nov. 5.—The scores in detail of the members of the Leominster Rifle Club in the Bullard rifle match No. 4 are as follows:

George F Trevear	7	9	7	10	7	8	7	7	10	8—80
	10	9	7	8	8	9	10	3	8	5—76
	9	8	7	7	9	9	9	8	8	8—82
	9	7	8	7	9	10	9	9	8	8—84
	9	7	8	8	10	7	8	4	10	7—77—399
E M Rockwell	6	6	7	10	7	8	9	9	7	4—71

THE REVOLVER RECORD.—The Boston *Herald* of Nov. 3 reports: Mr. F. E. Bennett, a member of the National Lancers, broke the pistol record of 100 shots at Walnut Hill yesterday, making a score of 857 points. A Smith & Wesson army revolver, .44cal., with factory ammunition, was used. Lastspring Chevalier Paine made, at Walnut Hill, what was supposed to be a record impossible to surpass, but the record of yesterday's work by Mr. Bennett beats it badly. The conditions of yesterday's shooting were identical with those under which Paine established his best record, viz.: 100 shots, standard American target, 50yds. Chevalier Paine's total was 841 points, which included 70 bullseyes. Mr. Bennett's aggregate was 857 points, in which were 77 bullseyes. The result of the match gives the best revolver record on the target by 16 points to Mr. Bennett. The last string of 10 shots was all bullseyes.

The conditions for shooting were unfavorable, a high, gusty wind blowing from 6 o'clock. The exhibition was conducted under the supervision of Mr. A. C. Gould, of the *Rifle*, and the scoring was performed by the official scorer of the Massachusetts Rifle Association. The detailed scores are appended:

1	7	8	10	10	9	7	10	7	9	10—87
2	8	9	8	9	7	10	8	6	9	9—83
3	6	10	9	8	10	10	9	8	10	6—87
4	8	9	10	6	6	10	7	10	8	8—85
5	7	9	8	8	9	5	6	9	10	7—78
6	9	10	8	7	10	10	8	10	6	9—87
7	10	9	9	8	10	10	10	7	7	9—89
8	10	9	9	7	9	9	7	10	8	7—89
9	9	10	7	9	10	7	8	9	7	10—86
10	10	8	9	10	8	8	10	9	9	9—90—857

OWENSVILLE, Ind.—The Owensville Rifle Team organized Oct. 20, 1887, under the name of the Owensville Ballard Rifle Team and is composed of ten members, they adopted the National rules and had their first weekly shoot for gold and leather medals Oct. 25, divided into two teams, 200yds., standard target:

Capt. Sumners's Team.										
Sumners	5	6	5	9	8	5	6	4	6	7—61
J Daugherty	6	6	5	4	5	4	3	8	4	10—55
W Roberts	3	2	4	5	6	6	4	7	9	3—49
G Wotter	6	4	4	8	8	10	7	7	6	4—62
J Stone	3	7	9	6	10	2	3	2	4	6—44—271
Capt. Montgomery's Team.										
Montgomery	3	6	9	9	5	4	5	8	9	6—64
McDaughterty	5	3	3	2	5	5	6	4	7	4—44
W Gentry	3	4	3	4	9	3	6	5	5	5—47
R Speck	6	8	2	8	2	2	4	5	2	7—46
H Mauck	6	6	6	8	6	6	4	5	9	4—60—261

Montgomery having the highest individual score wears the gold medal. In the shoot-off between Stone and Daugherty for leather medal Daugherty won.—J. M., Sec'y.

OUR OWN RIFLE CLUB.—Newark, N. J., Nov. 3.—The score shows a decided improvement over former shoots:

Snellen	115	F A Freiensehner	113
Fred Freiensehner	107	John Bayer	109
Chas Weeks	108	O A Kiefer	105
Willms	101	Miller	104
Knothe	103	J M Kiefer	103
Hunziger	101	Drexler	101
Bertram	100	Bander	100
Condit	108	Gutman	95
Kroeplin	94	Klem	93

Total 1,850, average 103⅛.

Yachting.

A WINTER SCHOOL OF YACHTING.

THE fifth and last regular meeting of the Seawanhaka Corinthian Y. C. was held at the club house on Nov. 8, with Com. Canfield in the chair. After some routine business and reports of committees, a motion of thanks to the Atlantic Y. C. for their offer of the use of the A. Y. C. landings at Whitestone and Bay Ridge was passed, also a vote of thanks to Vice-Com. Center for valuable contributions to the model and library collection. The proposal of Gen. Paine as an honorary member, made by Com. Canfield and seconded by Vice-Com. Center, was carried unanimously. A motion was made and carried to increase the annual dues of the club to $25 and the entrance fee to $50, to take effect after this year. Members joining the club during the remainder of the present year will pay the present entrance fee of $25.

From the following programme of winter work it seems that the interest in yachting which rose to such a height during the summer will not be permitted to die out as soon as the fleet is laid up, but that for the first time a strong and systematic effort will be made to render the winter season as profitable to yachtsmen as the summer is pleasant. Some of the clubs in times past have held regular winter meetings for study and discussion, the lectures delivered some years since before the Seawanhaka C. Y. C. by Mr. A. Cary Smith will be remembered as a very important step toward that improvement in design which of late has borne such good fruits, but the present undertaking of the club is far more thorough and systematic than anything before attempted by an American yacht club.

The general plan of operations laid down by the club was given in the FOREST AND STREAM at the time of the establishment of the club house last spring. Since that time the various committees have been industriously at work, with the result that the club has now a very suitable and convenient shore headquarters at its house at No. 7 East Thirty-second street, New York. The main parlor and meeting room is handsomely furnished in oak, while back of it is the library. Down stairs is a billiard room and a large and well fitted kitchen, which will be put into practical use during the winter. The upper part of the building is leased in apartments for gentlemen, chiefly members of the club. The library is furnished with the leading periodicals and newspapers, and the standard works on nautical matters, while a full set of coast survey charts will be kept corrected to date. The present library is but a beginning, but it is designed to include the standard works on all branches of nautical subjects, and to keep it fully up to the times, making a valuable reference library for yachtsmen. All charts of the Coast Survey and Weather Bureau will be on file. The club's collection of drawings of prize-winning yachts, including many leading yachts, is also under the inspection of members of the club, under suitable restrictions. The model collection thus far includes carefully made models of Mischief, Clara, Cinderella, Shadow, Intrepid, Grayling, Bedouin and Fanny, while others are now being made. The lines in every case have been fully verified before the model has been made, and every care has been employed to secure accurate reproductions in miniature of the boats. Two very handsome models have been presented to the club, one a full working model of a cruising schooner designed by Vice-Commodore Center, the other a finely made model of a rowing shell; both the handiwork of Mr. Gustave Grahn.

Another collection has been started that promises to be of the greatest practical value. Already the club has secured samples of the best American and English canvas, wire and manilla rope; and the collection will be increased so as to cover all materials and appliances used in yacht building; blocks, ironwork, brasswork, pumps, and similar fittings.

The cosy and cheerful rooms are every night well filled with yachtsmen, and if it went no further, the mere intercourse and informal discussion would serve to promote a spirit of sociability among the members; but the scheme proposes to do far more toward their instruction and entertainment during the winter.

In accordance with the plan first announced, the following course of lectures has been arranged:

Nov. 19—Hydrography; history; theory and methods of chart making.

Dec. 10—History and general theory of navigation.

Jan. 7—Practical navigation by dead reckoning.

Jan. 23—Mariner's compass; history; theory; variations, deviations, forms and correction.

Feb. 10—Chronometers; history; construction; regulation; care and use.

March 18—Aids to navigation; lights; buoys; fog signals, etc.

April 1—Tides and ocean currents.

April 22—Harbors; tidal action and flow, as illustrated by New York Bay.

All these subjects will be treated by officers of the United States navy and other well-known experts. Due notice of each lecture will be given.

A glance at the list shows the scope and importance of the subjects treated of, all of which are of prime interest to yachtsmen. There are comparatively few who are able to devote much time to study, the demands of business, society, and even of their boats engross much time, and few have the opportunities for special

study in any of the many deep and intricate branches which concern design and navigation. The object of the present course is to offer information in a compact form by means of lectures by experts in the various departments, giving such an intelligent and comprehensive review of each subject as may serve as an introduction and guide, as well as an inducement to the hearer of further study.

Besides the lectures practical instruction will be given as provided by the Society for the First Aid to the Injured, in the treatment of ordinary accidents; while the kitchen will be brought into play for practical lessons in cookery.

During the season a lecture, illustrated by the polyopticon, will be given upon the best methods of amateur photography.

An effort will be made to form a class for instruction in navigation, under Captain Howard Patterson, of the School of Navigation, with examinations for master's certificate; also a class for instruction in rigging and splicing, and one for practice in the use of hand signal flags, as employed in the Navy.

It is less than a year since the plan of a town club house was first proposed, and although an enormous amount of work was involved in the practical carrying out of the scheme, enough has been done thus far to make sure the ultimate success of the project. The Seawanhaka Corinthian Y. C. now offers to Corinthian yachtsmen every opportunity for study and improvement during the season when yachting is practically dead. In this club, however, the cessation of work in one direction is only the signal for new and no less beneficial exertions in another field, and the work of the winter is apt to bear good fruit in the summer's racing. The number of men who feel a deep and earnest interest in yachting and sailing and the studies connected with them, was never as large as now, and the club cannot fail to reap a full return for its liberal and progressive policy in an increased membership and a marked improvement in the standard of practical efficiency.

EARLY CENTERBOARD BOATS.

THE following extracts from an old publication, the *European Magazine*, are given by Mr. Herbert B. Powell in a letter to the *Field*, and throw additional light on the early application of the centerboard:

"A paragraph having appeared in the public papers that sliding keels are a new invention equal in importance to the discovery of the compass, I must beg leave to say that this assertion is not true, for sliding keels never can or ought to be fixed to ships of any sort, especially ships of war, which are hardly strong enough at present to bear the immense weight of metal, much less to be made weaker in the most essential part of them; nor would it be safe to have three large apertures lengthways in the keel of a ship, which, besides weakening, must hurt her stowage. If the discovery of sliding keels is great, the public are indebted for it to the Indians of South America, whose Balzas (see them described in 'Ulloa's Voyage,' Vol. I, page 181) have these sliding keels; and from them the idea has been taken, which has been very ingeniously improved upon."

Here follows a letter to Mr. Sewell, who appears to have been editor of the *European Magazine*, from Lieut. Malborn, R. N., dated June 20, 1792, in which the writer concludes:

"The slightest inspection will convince any one that the latter objection has no weight; and let facts speak for the former. The cutter built by the Admiralty, after eighteen months' constant cruising in the Channel, was found, on a minute inspection in Woolwich Dockyard, to be perfectly free from any appearance of defects that could possibly arise from her being weakened or strained by the sliding keels."

The next article refers to the sea-going qualities of the Trial cutter, refered to above, and is written by one who took a trip in her especially to observe the working of her sliding keels, called here "Capt. Schank's Sliding Keels." They weighed anchor at 5 P. M., July 3, 1791, off Gravesend, and crossed the "Spaniard," which sand they touched, but passed over "so easily that people only felt an unusual motion," the keel rising about 14in.

"This vessel, call the Trial cutter, built as far under the direction of Capt. Schank as our establishment will permit, is of the following dimensions:

Length..... ...65ft.	Burthen... .....121 tons
Breadth.....21ft. 4in.	Draft ready for sea.... 6ft. 6in.
Depth (moulded)....20ft. 11in. (?)	Centerboard below keel 7ft.
Depth (in hold)..... 7ft. 2in.	Draft extreme..... 13ft. 6in.

Pierced for twelve guns, mounts eight carriages and four swivels. Her keel a bad piece of timber.

"These sliding keels, as they are at present called, may with nearly the same propriety be called rudders, gaffs, booms, or any other term. They are composed of two planks 14ft. long, 3ft. broad for the fore and aft, another of the same length, 6ft. broad, for midships, which slide by means of a winch through the decks, and a mortice through the keel to the depth of 7ft. below the real keel at pleasure; thus they act as leeboards. * * * The room taken up by them and their wells, not more than 6in., before and aft the mast, is less than the mast and its step by 4in., consequently can be reckoned in no other light than a useful parting of cabins as well as stanchions to the deck, and are found useful in navigating; and the helm is so easily managed, that the strength of a child is sufficient when the keels are used, while that of a man with a tiller rope is scarce sufficient without them; and, as I was informed by the lieutenant (Malborn) and master, she could be steered, as was frequently done, by the keels only, and, in case of the loss of the rudder, could be navigated to any port by means of this invention. She draws 6ft. light, and 6ft. 6in. when all her guns and stores are in; other vessels of her burthen draw 13ft. This new invention, when down, extends 7ft. below her real keel, by which she keeps the wind better than any other vessel in the service; can carry as much press of sail as any vessel, and is capable of sowing more than any sharp-built vessel, etc."

In a previous issue of the same magazine is a letter to the Earl of Ailesbury, dated March 7, 1791, from one James Wright, in which Capt. Schank, after having a most flattering allusion made to the "buddings of his fine genius," is mentioned as having had

"Command of all His Majesty's ships of war on the great lakes [in America], which, in fact, are little seas. * * * It was there the invention of sliding keels for boats originated, and which answered beyond expectation, and greatly facilitated our success in different parts of the Continent. His great ingenuity in this difficult art has procured him the warmest patronage and friendship of the Duke of Northumberland, who was an eye witness in America to the great utility of sliding keels. * * * Two vessels were ordered by the Navy Board to be fitted out, each of 13 tons, and similar in dimensions, ballast and sails—one on the old construction, the other flat-bottomed, with sliding keels. Sir Charles Middleton, of the Commissioners of the Navy, and the surveyor attended; and, although the vessel had lee-boards, a greater quantity of ballast and two Thames pilots aboard (which was all unfair), yet Capt. Schank's vessel with three sliding keels beat the other vessel, to the astonishment of all present, one-half of the whole distance sailed, and no doubt she would have beat her much more had she been furnished with a Thames pilot; the currents of that river not being known at all to any of his sailors was a great detriment to the vessel's sailing."

It was after this trial that it was decided to build the cutter Trial, of 120 tons burden, the "command of which was given to Lieut. Malborn, a pupil of Capt. Schank. She proved a great success.

Editor Forest and Stream:

Sir William Petty, *circa* A.D., 1667, according to Evelyn's and Pepys's diaries, invented the centerboard. He also built the double-hulled Experiment, which "sayled 2ft. for 1 of any of His Majestye's shippes," and after a short but brilliantly victorious career was lost with all hands in a storm which wrecked hundreds of vessels in the Bay of Biscay. FLYING PONTOON.

BROOKLYN, N. Y., Nov. 4.

OPEN BOATS ON THE DELAWARE.—All along the Delaware from Trenton to Chester the old-fashioned catboat and sloop, sailed with five ballast to windward, are found in plenty, and many of the boats are very fast, with local reputations. This spring a new boat, the Coronet, was built for Mr. Dolan, of Torresdale, Pa., from a design by Mr. A. Cary Smith, and during the season she has done very well with the boats of local build. She has sailed against the winner of the regatta of July 4, beating her 37m. in a light breeze, and later in a strong wind she beat her 6m. in a three-mile beat to windward, when the wind fell and the race was called. This is a good record, especially when it is considered that the boats in any locality are usually the outcome of a long course of racing and specially adapted to the prevailing conditions.

NO CHALLENGE FROM NOVA SCOTIA.—A Halifax yachtsman, a member of the R. N. S. Yacht Squadron, writes as follows concerning the new deed of gift: "If the extracts published in some of the daily papers give all the important particulars of the new deed of gift, I fear it may be some time before there is another contest for the America's Cup. It seems there are no restrictions on beam or sail spread, and no time allowance; boats must be 90ft. and with enormous sail plans. This seems to be retrograding."

MONTGOMERY SAILING CLUB.—Twentieth weekly cruise, Norristown to Indian Creek and return, distance 5 miles. Wind very light at start, afterward fresh southwest. The start was made at 9 A. M. and the wind sprang up at 10:20 so that fully one hour was lost in drifting about before the real sailing commenced. The Flying Eagle started about 10:20 and sailded the course in about 1h. 10m. Owing to errors made by the time keeper the times made by the Playford and Lulu are estimated from their relative position at the finish, and may not be absolutely correct.

	Finish.	Corrected.
Bowers, tuckup, DeHaven	11 18 13	2 10 33
Igidious, tuckup, Wm. Rochell	11 15 54	2 17 44
Gracie, skiff, E. A. Leopold	11 27 15	2 18 12
Priscilla, tuckup, E. Stanley	11 18 19	2 18 56
Josephine, tuckup, E. Sowers	11 21 00	2 20 25
E. C. Potts, tuckup, Parker Bros	11 23 52	2 22 12
Playford, tuckup, Grisdale Bros	11 24 01	2 22 21
Princess, canoe, C. Wainwright	11 29 55	2 22 38
Lulu, tuckup, J. Frith	11 24 20	2 24 09
H. C. Scott, tuckup, W. Carnathan	11 27 45	2 26 45
Flying Eagle, tuckup, J. Berndt	11 30 29	2 30 29

Bowers winner champion flag. A protest was filed against Josephine for paddling over the line at the start, and also against H. C. Scott for sculling with the rudder. Judge, Thomas Rochell.

Oct. 30.—Twenty-second and last regatta of the season, Norristown to Indian Creek and return, distance 5 miles, weather clear and cold, wind fresh northerly. The start was made at 9 A. M. The boats were all tuckups:

	Length.	Finish.	Corrected.
Priscilla	15.03	10 13 10	1 13 47
G. W. Bowers	15.04	10 18 16	1 16 35
H. C. Scott	14.11	10 18 50	1 17 50
Josephine	15.05	10 18 52	1 18 15
Igidious	15.05	10 16 40	1 18 30
Lulu	14.10	10 20 56	1 20 45

Priscilla wins champion pennant for the fourth time. At the close of this race the record for the season stood as follows: Priscilla winner 4 times, Flying Eagle 4, Cocktail 4, Josephine 3, Gracie 3, Igidious 2, Bowers 1, Little Tycoon 1. The tie for first place was sailed off in the afternoon at 2 o'clock. At this time the wind had increased to a whole sail breeze, some of the smaller boats who accompanied the racers preferring to take in a reef. The usual course of 5 miles was sailed:

	Finish.	Elapsed.	Corrected.
Priscilla, L. G. Palmer	3 05 00	1 05 00	1 05 37
Flying Eagle, Geo. Ritter	3 10 40	1 10 40	1 10 40
Cocktail, Paul Brandt	3 12 15	1 12 15	1 11 15

The Priscilla wins the championship for the season of 1887. The time made in sailing off the tie was the best ever made over this course. The Priscilla had a lead of nearly half a mile at the finish. She carried a mainsail of 191ft., and had a crew of three men including the captain. She was built this season by Wignall of Philadelphia, and is undoubtedly the fastest boat in the club. The Flying Eagle has 162ft. of canvas and carried four men. The Cocktail carried 165ft. of sail and three men. The Priscilla won nearly all of her lead by close pointing in three long reaches to the buoy at Indian Creek, the other boats making about a dozen tacks each. She increased her lead slightly in the run home by virtue of her large sail and small crew. Judges, Thomas Rochell and William Alcorn.

The following summary of some of the leading features of our boats and racing this season may interest some of your readers. The Montgomery Sailing Club was organized last March with about a dozen members on the roll. There are at present forty-four active members in the club, and it is proposed to raise the initiation fee very materially as a means of checking its rapid growth. The boats range from 12 to 16ft. in length, and race in one class under an allowance based on the cubical contents of each hull. The fleet originally consisted of tuckups and duckers of about 15ft. length, and one open canoe or skiff 12ft. long. Shortly after the organization of the club, the owner of the hiker Mayflower applied for admittance to the club. A majority of the members were opposed to the admission of such a craft, and a rule was adopted limiting the size of mainsail of any boat to 180ft. The Mayflower is a 15ft. boat and carried 40yds. (240ft.) of sail. When reefed down to 190ft., the 12ft. skiff, Gracie, beat her over the course without time allowance. Mr. Adams, the owner of the Mayflower, then ordered a 16ft. hiker of one of the most skillful builders in Philadelphia. The new boat carried a sail of 50yds. (300ft.) and is named the Pennsylvania. After repeated requests by her owner, the boat was entered on the club list and given an arbitrary handicap of 12 minutes for a course of 5 miles. The owner accepted the handicap and competed in a number of races, withdrawing in all excepting two, in which cases he was placed last. The record of the club boats for the 22 races sailed this season is as follows. The boats are allowed points in accordance with their position in each race, the last boat being allowed one point, next to last two points, etc., the winner being allowed as many points as there were boats in the race. The record is based on corrected time, not actual time.

	Length.	Cu. Ft.	Sail Area.	Races.	Points.	Average.
Cocktail	14.09	46	165	8	50	6.25
Priscilla	15.03	45	191	14	86	6.14
Flying Eagle	15.04	51	162	15	86	5.73
G. W. Bowers	15.04	43	6	32	5.33
Gracie	12.00	20	85	19	100	5.26
E. C. Potts	14.11	43	164	15	71	4.73
Josephine	15.05	48	161	14	64	4.57
Igidious	15.05	51	191	19	83	4.36
Playford	15.02	43	2	8	4.00
Lulu	14.10	50	174	11	36	3.27
Ino	15.02	38	110	12	38	3.16
Princess	15.00	24	85	2	6	3.00
Elsie	14.10	38	110	11	30	2.72
Little Tycoon	16.00	54	177	7	19	2.71
H. C. Scott	14.11	46	172	9	22	2.44
Pennsylvania	16.00	500	2	2	1.00

The column of cubic feet refers to the size of the boat and is obtained by the following formula $\left(\frac{G}{4}\right)^2 \times \frac{L}{2}$ = cubical contents of hull. G is the girth of boat at point of greatest beam, and L the length. Centerboards are raised or removed when the girth measurement is taken. The Gracie is heavily handicapped in girth measurement, as she has high sides with wooden blocks fastened outside of gunwales, for rowlocks, and a 4in. keel, around which the measuring string was drawn. Her girth is recorded as 7ft. 4in., while that of the Princess, a boat of the same depth and 2in. more beam is 7ft. 2in. The allowances for a five mile course are as follows: Little Tycoon allows Igidious and Flying Eagle 33s., Lulu 44s., Josephine 1m. 8s., Cocktail and H. C. Scott 1m. 33s., Priscilla 1m. 46s., E. C. Potts, G. W. Bowers and F. & W. Playford 2m. 13s., Ino and Elsie 3m. 25s., Princess 7m. 50s., Gracie 9m. 36s. Priscilla and Igidious are handicapped 1m. 50s. for excess of sail area.—E. A. LEOPOLD, Com. M. S. C.

NEW YACHTS.—Mr. A. Cary Smith will begin at once a design for a singlesticker for the second class for a member of the New York and Seawanhaka clubs. She will be a racer, of light construction, and the wooden hull will be built by Poillon, at Gowanus. The dimensions and details of the design are not yet fully decided upon.... Mr. E. L. Williams, the designer and builder of Pilgrim and Pride Karl, has completed a design for a centerboard-keel boat for a Boston gentleman. She will be 36ft. l. w. l., 14ft. beam at deck, 12ft. 3in. beam at l. w. l., 5ft. 9in. in extreme draft at sternpost. She will carry 7½ tons of lead on keel.... The new Burgess schooner, which the Lawleys will build, is for Mr. Herman Oelrichs, of New York.... Besides the steel yacht from Mr. Watson's design for Hamilton, Ont., there will be added to the local fleet a Burgess boat about 38ft. l. w. l.; one from a design by C. P. Kunhardt, and a cutter from a design by Mr. C. P. Clayton, of Southampton, Eng. This last boat will be 60ft. over all, 42ft. l. w. l., 13ft. beam, 9ft. draft, with 15 tons of lead on keel.

STUART'S OIL AND GREASE EXTRACTOR.—The steam yacht Stranger, Mr. Geo. S. Scott, now refitting for a Southern voyage, is using successfully the new oil and grease extractor invented by Mr. Sinclair Stuart, and fitted to the Cunard and other large steamers. By this device the oil, grease and grit are extracted from the exhaust steam before it is returned to the condenser, pumps or boiler, preventing the injury to them which follows the presence of oil and grease. This is the first application of the device to yachts, though it is of no less value than in merchant vessels.

YACHT MEASUREMENT ABROAD.—At the meeting of the Council of the Y. R. A. on Oct. 25, Mr. W. G. Jameson made a motion that length on loadline be struck out of the measurement rule, making it a pure sail area rule, which motion was seconded by Capt. Percy Hewitt. The weight of opinion in the discussion that followed was against any alteration of the present rule, made last December for 7 years. A letter was read from Mr. Watson protesting against the efforts to change the rule, and also against the sail area rule itself. A vote was taken, only Mr. Jameson voting in favor of the changes. By a unanimous vote the B and C classes were abandoned.

Canoeing.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signal, etc., of their clubs, and also notices in advance of meetings and races, and report of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

AMERICAN CANOE ASSOCIATION.

OFFICERS, 1886-87.

Commodore: R. J. WILKIN, Brooklyn, N. Y.
Secretary-Treasurer: WM. M. CARTER, Trenton, N. J.

OFFICERS-ELECT 1887-88.

Commodore: R. W. GIBSON..... } Albany, N. Y.
Secretary-Treasurer: F. L. MIX. }
Vice-Com. *Rear-Com.* *Purser.*
Central Div..Henry Stanton...R. W. Bailey.....E.W. Brown, 146 B'way, N.Y.
Eastern Div..L. Q. Jones.....Geo. M. Barney....W. B. Davison, Hartford.
N'thern Div..A. D. T. McGachen, W. G. McKendrick. S. Britton, Lindsay, Can.

Applications for membership must be made to division pursers, accompanied by the recommendation of an active member and the sum of $2.00 for entrance fee and dues for current year ($1.00). Every member attending the general A. C. A. camp shall pay $1.00 for camp expenses. Application sent to the Sec'y-Treas. will be forwarded by him to the proper Division.

Persons residing in the Central Division wishing to become members of the A. C. A., will be furnished with printed forms of application by addressing the Purser.

PROPOSED AMENDMENTS TO CONSTITUTION.

Editor Forest and Stream:

While the objections of "Rank and File" in the last number of FOREST AND STREAM are all right in principle, he takes an extreme view of the case and one that can never arise in practice. The idea of the amendment, as I understand it, is that the executive committee shall have the benefit of the advice and counsel of some of the oldest, ablest and best members of the A.C.A.; men who have been chosen to fill the highest office in the Association. The number of commodores is small and increases only by one each year, the full number thus far being seven, including the commodore who retires at the coming meeting. Of these seven one is present by right, while only one or perhaps two others are at all likely to be present. In practice it means this year that one ex-commodore, who will be in Albany, will be admitted to the meeting. Next year one or two may be present whose voice and counsel might aid the executive committee, composed in part of new men. As the commodores are chosen from all localities there is little danger of any concerted action against the will of the majority, and as very few are likely to avail themselves of the privilege if offered there does not appear to be any great danger of such a result as "Rank and File" anticipates. C. P.

THE LOCATION OF THE NEXT MEET.

THE question of the location of the meet, always a difficult one, is made still more complicated this year by the action of the Eastern canoeists in declining to accept the Commodorship and consequently the management of the meet, which went to them this year by right. It was expected that with a meet in the Eastern Division, the site would be on salt water about Long Island Sound, as the Eastern men had favored such a meet, but at the last moment their decision not to accept the Commodorship made it necessary to elect a Commodore without regard to the plan of rotation, which it was intended should be a permanent feature of the division scheme. The election of Vice-Com. Gibson to the office of Commodore was a very wise act, considering his long experience in A. C. A work, and the necessity of having an able and experienced man in the position at this time; but it carried with it the necessity of holding the meet somewhere within reach of the Commodore, as he must personally look after most of the arrangements. It has been informally proposed to hold the next meet at Lake George, and many who have been there before are in favor of it; but, as will be seen, the project has brought out some vigorous protests from canoeists about New York.

It is claimed, and with some reason, that a meet near New York city and on salt water would only be just to canoeists in that vicinity, and would be of permanent benefit to canoeing and the A. C. A., also that the meets have been for a long enough time in the vicinity of central New York. Our correspondent "Boatswain" goes into the matter in earnest, but after pitching heavily into the Association he offers no practical solution of the real difficulty. His inferences from the figures are misleading, the reason for so large a preponderance from the Middle States being because the canoeists from that locality so for outnumber those in the West and Canada. He is also in error in his statement concerning the West; the definite offer of the Commodoreship and a meet in the West was made in 1885 by the A. C. A., but Western canoeists preferred to be entirely independent of the A. C. A.

We should favor a meet near New York as but fair to canoeists in that locality and likely to benefit canoeing, but the great question is as to where it could be held. In fact the great requisites of a large meet, still water and no tides, are not to be found on the salt water. There are no good places on the Hudson River; Staten Island, New York Bay, and the west end of the Sound offer no suitable sites, the location mentioned by "Boatswain," the Shrewsbury River, is unsuited for a meet by reason of the violent tides and the rise and fall. The river itself is small in extent, and the shores we believe low, while about the Highlands and mouth of the river, though a most beautiful cruising ground, there is no water for a meet, the tide being unusually strong.

There are many beautiful spots along the Sound on both shores, but everywhere the same objection holds good, the rise and fall of the tide. What would be done with a fleet of two or three hundred canoes on a beach where the tide runs up for a hundred feet and down again twice each day, to say nothing of the chance of a heavy sea? No system of floats seems possible without an extraordinary outlay, and no other plan has yet been proposed. At Grindstone and Bow-Arrow Point, a canoe was run out or off of the rough stages a dozen times each day by her owner alone, but on a tidal beach a carry of a dozen yards at least must be made every time a canoe is used, while there is apt to be more or less danger from the sea. There are beautiful camp sites and fine sailing waters in abundance, Thimble Islands, Huntington Bay, Narragansett Bay, but all have from 4 to 5ft. rise and fall of tide. Shinnecock Bay is the best in this respect, but even it has the disadvantage of being difficult of access.

This much seems certain, that a salt-water meet will not be specially pleasant to inland men, the hot sand, salt wind, strong currents, and difficulty of landing, to say nothing of possible mosquitoes, all combine to make salt water very trying at first, and those who take the responsibility of a salt-water meet may expect to be roundly blamed if it is not a success. It is readily seen that such water as Lake Champlain or the St. Lawrence offers far greater advantages for such a gathering as a large meet of canoes, and glad as we should be to see a meet near New York and on salt water, we are still willing to go a little further afield for such a camp as on Eel Bay or at Bow-Arrow Point. The question will be decided this week, and we hope satisfactorily to the majority. The time must come soon when the Central Division will be divided, forming a new division with New York as a center, and then the division meet will inevitably be on salt water. Such a division now seems a necessity, as there are many canoeists about New York city and New Jersey who cannot visit a distant meet and for whose needs some provision must be made.

Editor Forest and Stream:

I notice in this week's issue of your paper, that the "Jerseyites" want Lake George to be the place of the A. C. A. meet for 1887.

That may be the opinion of one or two of the canoeists from the State, but it is not the wish of the great majority. We are united on a salt-water camp, and are not particular where it is held. I would mention the Shrewsbury River as a place easy of access and with good sailing grounds. At Red Bank, on the North Shrewsbury, there are about fifty canoeists, who no doubt would come into the ranks if we could have a meet where they could enjoy it. Fifty canoeists would be at the meet from Passaic waters, while if it is held at the north the number would not be over half a dozen. In your issue of Sept. 29 the secretary of the A. C. A. publishes a list of members who have not paid up. The account stands about thus: West 35, East 31, Middle 105, North 2 and South 2 members. The West have taken the bull by the horns and have an organization of their own and will not come back into our ranks. Why? Because they have been badly treated by the A. C. A., the meets being held always in the North. Why is it that the Middle States have so large a majority in the above figures? Because the meets are held where very few canoeists can get at them. Every year there is talk of "next year" the meet will be near New York, canoe owners join the A. C. A. on that idea, the meet "next year" is not held near New York, the "next year" those same canoeists do not pay up, and do not care if they are ruled out of the Association for not "paying up," because they have an idea the A. C. A.

is a fraud anyway, being run in the interest of the few who can get time and have the means to attend the camp at the North.

Why is it that the names from the North are in such a small minority? Because the meets have been held where the Northern members can go to the camp without taking three or four weeks to do it.

If the meet could be held next year near New York waters, it would in my opinion bring into the Association a number of new men, and it would also have the effect of making the list of members in arrears smaller from the Middle States.

Now let us be just, not generous, and have a square deal. There never has been a meet held by the A. C. A. south of Albany. Let's have one next year. BOATSWAIN.

PATERSON, N. J., Nov. 4, 1887.

Editor Forest and Stream:

"Essex" says in FOREST AND STREAM that Lake George will be entirely satisfactory as a location for next A. C. A. meet to the Passaic River canoeists. "Essex" can speak for himself, but hardly for the rest of us. Arlington C. C. unanimously in favor of a salt-water meet. If held on salt water, she would be represented by several of her members, who are not now in the A. C. A.

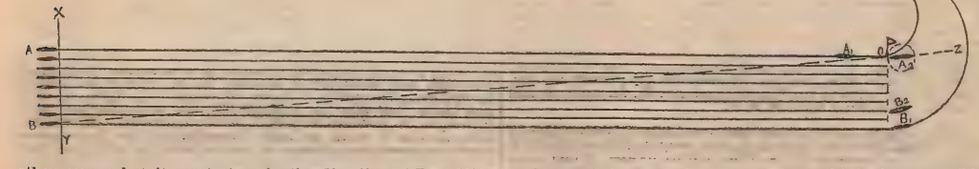
ARLINGTON, N. J. IRVING V. DORLAND.

Editor Forest and Stream:

The article from the pen of "Essex," stating that the feeling on the Passaic is unanimously in favor of the next A.C.A. meet being held at Lake George has created much surprise along the Passaic, as it is misleading and at variance with the desire of our river canoeists. "Essex" has presumed to speak for the Jersey canoeists through your columns and has stated, without foundation, that Lake George would be most acceptable to all as the site of the next A.C.A. meet. We beg to state that such is not the case and submit that the hundred or more canoeists on our river are in favor of a salt-water meet. At the last regular meeting of the Ianthe C. C. (twenty-five active members), held Nov. 3, the subject was thoroughly discussed and a vote showed the club to be unanimously in favor of salt-water meet for '88.

WM. P. DODGE, Sec.-Treas. Ianthe C. C.

Editor Forest and Stream:

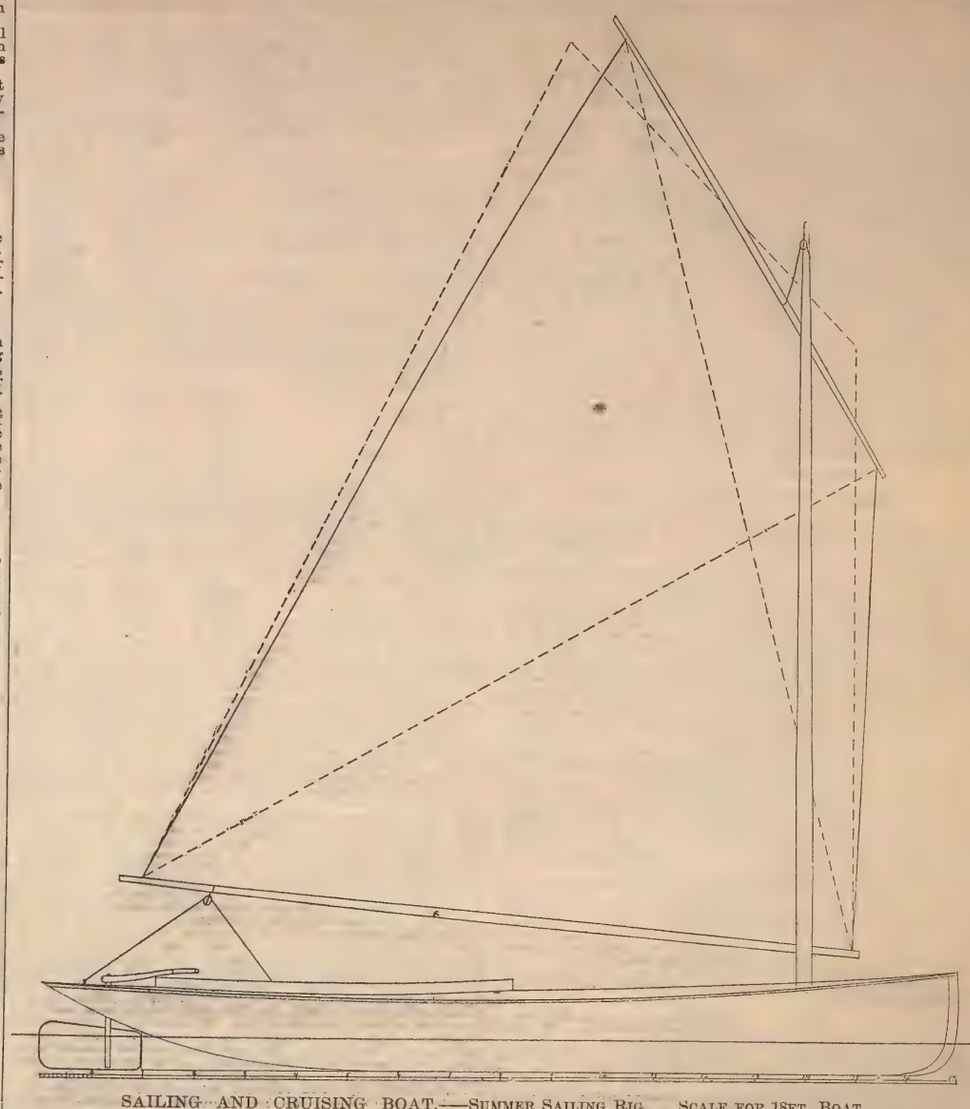


A letter in your last issue, written by a Jersey canoeist who signs himself "Essex," favoring Lake George for the next A.C.A. meet, does not seem to have met with general approval among New Jersey canoeists, who by a large majority would very much prefer a salt-water meet. Our club is unanimously in favor of it and feel that we are expressing the sentiments of many others in saying that we think it only fair that the canoeists in the vicinity of New York should have the benefits of the meet at least once in seven years. A. OAKLEY, JR., Purser Rutherford C. C.

RUTHERFORD, N. J.

PADDLING RACES.

THE present tendency in canoe racing seems decidedly to be in the direction of sailing, the sailing races at the meets exceeding in interest the paddling contests, and attracting far more notice both from canoeists and casual spectators. In club regattas the same holds true, the reason in all cases partly being that a canoe under sail is a far more pleasing sight than one under paddle, and also because the sailing race affords amusement for several hours, while the more exciting paddling race is over in a few minutes. Most men prefer sailing to paddling, and the boats they bring to the meets are fitted for the former rather than the latter, while there are but few who care to undergo even the comparatively light practice which is necessary to make a fair show in a paddling race. There seems little probability that the sailing interest will not always be fully able to take care of itself, and for this reason the chief care of regatta committees should be for the paddling races. In order that the all-round character of the canoe be preserved, and not sacrificed to the sailing qualities, it is necessary that all inducements should be offered to men to compete in the paddling races. It has been suggested, and we think wisely, that the A. C. A. trophy should be given each year not for a sailing race only, but for a combined race, half sail and half paddle. The trophy brings out the finest fleet and provides the best racing of the meet, and there seems no reason why a portion of the benefit should not go to the paddling. The gift of another prize as a paddling trophy would not answer the same purpose, as it would bring out men who make a specialty of paddling, and boats built exclusively for it, though nominally inside of all rules. The opening of the trophy race to paddling as well as sailing would keep in the all-around boats and the same sailing men as now race, but it would direct attention more closely to paddling qualities, and would make the racing test coincide more nearly with what is generally admitted to be the best test of a canoe, nearly equal sailing and paddling qualities. Practically the change would be in the direction of the all-around boat which is commonly considered to be the aim in canoeing. The tendency of the change would be toward lighter and better modeled canoes, but there is no reason to apprehend that essential qualities, power, room and safety, would be sacrificed to a greater extent than at present in some of the purely sailing boats, as Pecowsic.



One question that has never received much attention is the management of the paddling races, as on this point the rules are very incomplete. The desirability of starting and finishing at the same spot, for the benefit of the spectators as well as for convenience in starting and timing, has made turning instead of straight-away races the rule, but as now arranged it is almost certain that a foul, with all its unpleasant consequences, will result. The accompanying diagram represents the usual course of A. C. A. and club races, a half mile and return, the starting and finishing line being at X Y, and the turning flag at O, to be left on port hand. The canoes, from six to twelve in number, are ranged along the line X Y, generally without any drawing for position. Each canoe requires ample room in which to swing a 9½ft. or 10ft. paddle, at least 12ft., and its "water," in racing parlance, will represent a lane that wide over the course. With nine canoes, as shown, the line will be about 100ft. long, and the flag should be opposite its center. The course of the canoe on the left, marked A, is plain enough; it is direct from A to O. Going to the other end of the line the ninth canoe B is only as far as A from O, but its course is not direct to O, or it would cross the courses of seven

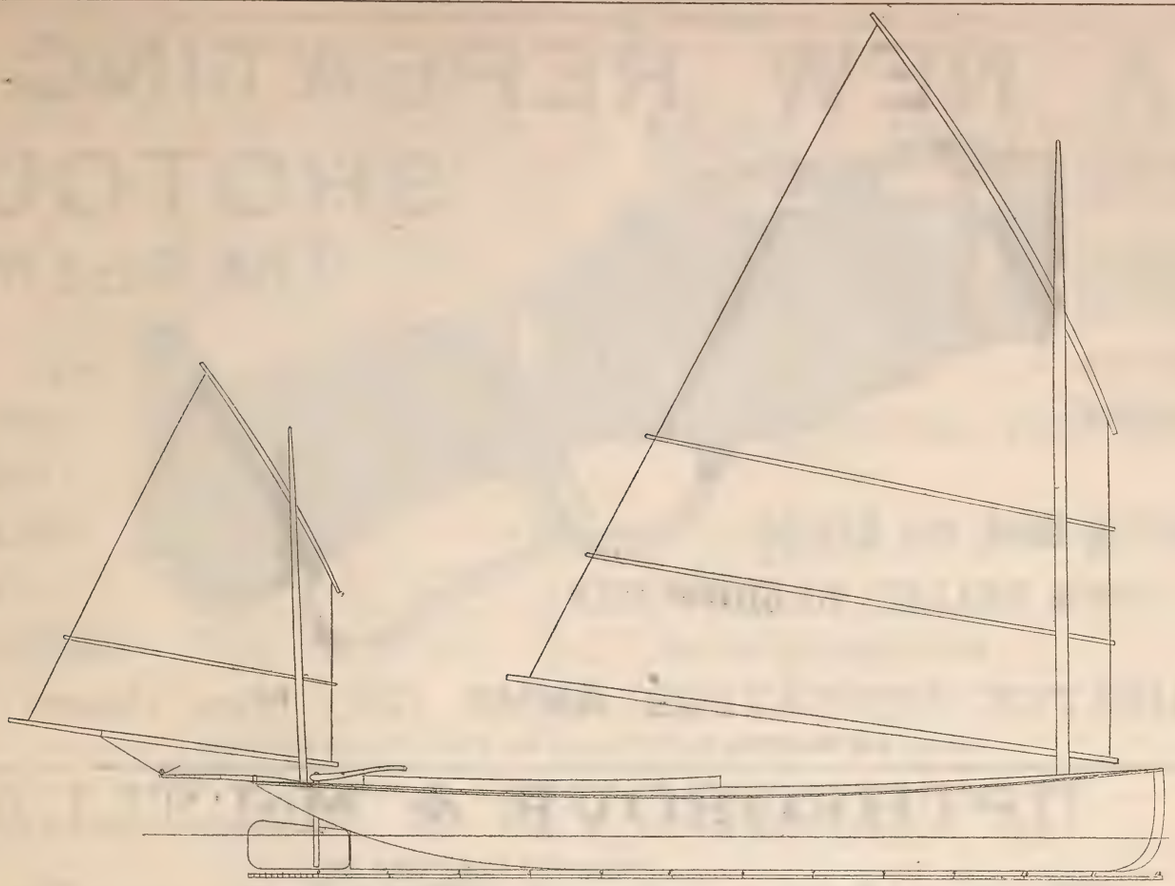
other canoes, but it must steer in the direction of B, or 100ft. further than A. Supposing A and B to be evenly matched, and each a little better than the rest of the field, then when A reached O he would be abreast of B, but really a long distance ahead of him. Supposing B to be the better paddler to an extent that at the end of half a mile he will lead A by just a clear length, then when A is at A_1, B will be in the position B_1. Practically the boats close up near the buoy, one or two drop some distance astern, and B will edge over to an intermediate position, B_2, perhaps, but 50ft. from A, instead of 100 as at the start. B at once begins to turn, describing a circle somewhat smaller in diameter than the outer one shown, and paddling only forward strokes on the outer side. As soon as he begins to do this, which must be before he is quite abreast of the buoy, his speed at once diminishes considerably, in consequence of the change of direction, the lessened force on the paddle, and the drag of the rudder. A, however, will keep his course without any retarding influence, about in the direction of Z, and when he reaches the position A_2 he is in the best possible place to stop B, who has now completed about half of his turn. A's proper course is to begin to turn as soon as he is up with the mark, describing the inner circle shown, in which case he will be reasonably apt not to impede B, but there is a strong temptation for A to work as hard as possible to reach the position A_2, somewhere on the line between O and Z, before B can cross this line in making his turn, and the circumstances all aid A in this effort. After reaching A_2 by a spurt he can afford to take matters easily. Not only B but all the others are astern of him, and he can claim about 20 to 25ft. of the line O Z as his water, as he is constantly moving ahead, and any boat fouling him then is almost certain to be disqualified. If he choses he can lie at A_2 and turn slowly by backing on the port side, describing the small dotted circle, the other boats meanwhile either being bunched astern of him, or having to make a long detour around Z and still risk the chance of being headed by A. When A has finally turned in the manner mentioned and his bow is toward home, he goes ahead with a spurt, leaving B and the ruck to complete their partly made turns as they can. This is an extreme case, but it serves to show the great advantage that goes with the position A, and something of this kind is apt to happen in every race. Even if A is paddling a perfectly fair race and striving to win only on his merits, he is apt to find himself in a position where he must give up what he honestly believes to be his or must take something which as obviously belongs to B.

One weak point in the rules is the fact that all the boats must use one piece of water in common at the turn, and that if a boat kept as strictly in its own water on the turn as on the straight part of the course, the outer boat would be handicapped by some hundred feet or more. The courses naturally converge at O, and no judge can say that the water about the mark belongs to any one boat, unless to A. It has been proposed that all backstrokes be forbidden, which would prevent a boat taking the position A_2 and then turning at leisure. All would be obliged to make a wide sweep in turning, either with the aid of the rudder or by using the paddle only for forward strokes on the outer side, and this would make the race much fairer, as A would be obliged to keep moving all the time. In small races where one mark must answer, this rule would lessen much the chances of a foul, and it would equalize matters and take away some of the advantages of A's position at the start, if the flag were placed directly in front of B's end of the line. In all races the start and finish should be exactly at right angles to the first and last legs of the course respectively, as a close finish can never be fairly decided on an oblique line. In all important races, or where more than three or four are entered, there should be a separate flag with his color for each man to turn; at the meets at least, this is always possible. The courses are in shoal and quiet water, where flags can readily be set out and left during the meet. With this done the great inducement to fouling is done away with, B will have no need to press toward A and crowd the intermediate boats, and A will be unable to interfere, even if he should desire to. Nothing is more unpleasant than a foul; it robs the victor of half his pleasure, it puts a great responsibility on the committee, and much ill-feeling is apt to follow, so that anything which tends to prevent fouling and at the same time to add to the interest in the races must be welcomed by both contestants and spectators.

TORONTO C. C. NOTES.—*Editor Forest and Stream:* Since holding our annual regatta we have had five races as follows. The first was a passenger race for a gold pin, which, much to the surprise of every one, was won in a good stiff wind by the "skinflint," otherwise known as the Mac, with the Una second. The second was the last of the series of five for the sailing trophy, which was won by the same craft, the wind being very light; the only other competitor, the Dawn, did not finish. The third was the combined paddling and sailing, with the same result, Mr. A. H. Mason unfortunately breaking his paddle when leading in the first round. The fourth was the decked paddling, in which Mr. W. A. Leys's Dawn took first place, leading the Mac by a length. The fifth event was the open paddling, in which Mr. Colin Fraser came out on top, with Mr. Douglas a good second. The regatta committee in the spring offered five medals to be competed for, the number of races for each to be limited to five, and the competitor showing the largest number of wins during the season to receive the medal. Below are the lucky winners: Sailing (decked), Mac, W. G. McKendrick. Sailing (open), Una, Colin Fraser. Combined, Mac, W. G. McKendrick. Paddling (decked), Dawn, W. A. Leys' Paddling (open), Una, Colin Fraser. The season here is practically ended, the weather being so cold, raw and windy that sailing is out of the question, and the majority seem more desirous of cultivating a closer acquaintance with the base burner than of working against the elements with the ash. With the cold weather in view it is a case of "hang up the paddle and bring down the snowshoes," that when winter strikes us we will commence our tramps across country to an inn, where, with roast turkey and plum pudding galore (not forgetting the toothsome pie) we pass many pleasant evenings in what Mark Twain would call swapping lies.—MAC (Toronto, Nov. 4).

SAILING AND CRUISING BOAT.—SUMMER SAILING RIG. SCALE FOR 18FT. BOAT.

RIGS FOR SAILING AND CRUISING.



THE accompanying sail plans show several rigs suitable for the boat illustrated last week, the scales given being adaptable to either size of boat. The Delta was rigged with a single large lug of about 150ft., which she carried easily without ballast in ordinary weather. The lug was cut with very little round to the head and the yard was straight. There were no battens in the sail, but two rows of reef points. The sheet was fast to an eye-bolt on the quarter and led through a block on the boom, and then under a thumbcleat on the side of coaming, or through a snatch block on the floor of the boat. Under this rig the boat handles very satisfactorily for singlehand sailing, but some ballast would be needed if no passengers were carried. The dotted lines show the size of a cat rig, the mast being stepped further forward. The lug is the better of the two, but is more difficult to rig, and many will prefer the cat simply because they are used to it and unfamiliar with the other. The main and mizen rig in the second drawing is smaller, and better adapted for cruising and sailing alone. The many details of the rigging are not shown, as they were very fully given in the description of the rig of the FOREST AND STREAM cruiser, July 1, 1886. The sails here shown are of the form usually carried on canoes and small boats, but a flatter and more effective sail can be had by making the yard longer, carrying it down to the batten, rounding the head much more than is shown, and throwing a little more of the yard forward of the mast, as in the Cruiser's sail. Such sails require to be carefully rigged and more or less trial is always needed to find the best position for halliard and tack on the spars, but when once complete they are good enough to fully repay the trouble. The dimensions of the single lug are as follows:

	18FT. BOAT.	13FT. BOAT.
Mast, from stem	3ft.	2ft. 3in.
Above deck	15ft.	10ft. 10in.
Diameter at deck	3¼in.	2¾in.
Boom	14ft. 9in.	10ft. 6in.
Diameter	2in.	1¾in.
Yard	10ft. 6in.	7ft. 7in.
Diameter	1¼in.	1⅛in.
Foot of sail	14ft.	10ft. 1in.
Luff	9ft. 6in.	6ft. 10½in.
Head	9ft. 9in.	7ft.
Leech	19ft.	13ft. 8in.
Tack to peak	18ft. 6in.	13ft. 4in.
Clew to throat	16ft. 6in.	11ft. 11in.
Area	155sq. ft.	80sq. ft.

The dimensions of the main and mizen rigs are:

	18FT. BOAT.		13FT. BOAT.	
	Main. Ft. In.	Mizen. Ft. In.	Main. Ft. In.	Mizen. Ft. In.
Main, from stem	2 00	17 00	1 06	12 03

Area	90sq.ft.	26sq.ft	49sq.ft.	14sq.ft.

The drawings show the size of sails when stretched on the spars after a little use. They must be cut a little smaller than this in making, and after a season they will have stretched to the full size of the spars shown.

SAILING AND CRUISING BOAT.—CRUISING RIG. SCALE FOR 13FT. BOAT.

AN INVITATION FROM THE TURTLES.—Albany, Nov. 5.—Members of the A. C. A. visiting Albany at the time of the meeting of the executive committee are cordially invited to dine with the Mohican Club at the Delavan House on Saturday, Nov. 12, at 7 o'clock. Members expecting to be present are respectfully requested to notify the purser by mail.—W. HOWARD BROWN, Purser M. C. C. (478 Broadway, Albany).

"Maw," said a gentle, confiding Arkansas maiden of 19 summers, "Lige Kilso have asked me to marry him." "He have?" asked maw, in tones foreboding trouble. "Yes, maw; an' I said as how I reckoned I would." "You did, hey? Wal, you kin jist say ez how you'll do nothin o' the sort the very nixt time Lige comes trapsin' 'round hyar." "But I love Lige, maw," said the maiden, with her sleeve to her eyes. "You love him! Love a pore, poverty-struck stick like Lige Kilso? Whar's yer pride? Whar's yer raisin'? Hey?" "What's the matter of Lige?" moans the maiden. "The matter of him? Ez if you didn't know that Lige Kilso was 25 year old, and that he didn't have one solitary single dog—no, not even so much ez a pup—to his name, nor airy fiddle to his back. D'ye forget that? An' if yer half ez smart ez ye might be you kin marry Buck Daggs, an' he's got nine good dogs, full growed, and two splendid pups, an' four as good fiddles ez they is a-goin'. No, my darter, I ain't no desires to be what you may call mershenary, but when a gal has a chance ter marry rich, let her do it, sez I."—*Tid Bits.*

Our most assiduously fashionable girls are not shooting their own follies, but birds as they fly—or, at least, they are trying to hit the winged game with rifles. Out at Tuxedo, which is the late autumn resort of the Astor set and their selected following, gunning is the favorite sport for maidens and young matrons. Light, dainty, silver-mounted weapons are rogueishly popped off, and sometimes a bird is hit. A pretty little gamebag is always hung at the huntress's side, and she never returns without something in it; but there is a scandalous rumor that the dead warblers are bought ready-shot from boys who make a good income transiently out of the fad.—*New York Letter.*

ANSWERS TO CORRESPONDENTS.

VIATOR.—1. Use a wire scratch brush and then vaseline. 2. Let us hear from you.

J. S. W., Toronto.—We believe the Strong Firearms Co., New Haven, Conn., manufacture it.

H. E. W., Newark, N. J.—Prof. A. M. Mayer has determined that with a charge of 3¼drs. powder, 1¼oz. No. 8 shot, Curtis & Harvey powder, 10-bore gun, the shot attains a mean velocity of 749yds. per second over a range of 40yds. For full account of experiment see FOREST AND STREAM, Oct. 28, 1880.

The St. Lawrence Gang.

This cut shows No. 1-0 (or Black Bass size) with living Minnow attached.
MANUFACTURED IN ALL SIZES FROM No. 5-0 TO No. 4, SUITABLE FOR
Muskallonge, Pickerel, Black Bass, Lake Trout, Etc., Etc.

All have patent treble hook with baiting needle, adjustable lip hook and treble swivel, and best silk metal wound gimp.
This is the most ingenious invention and radical improvement in trolling tackle yet made. Its manifest superiority to all gangs now in use is evident to every expert angler. A few of its peculiar excellencies are:—It is the only gang on which a bait can live. It is the only gang which can be adjusted to any sized minnow instantly and perfectly. It is not only the simplest but also the strongest gang made. It does not scare away the big and wary fish by a long array of treble hooks. The treble swivel insures perfect revolution of bait and reduces to the lowest possible point the liability of kinking the line.
If your dealer does not keep our goods in stock, or will not order them for you, send 50 cents for our 128-page folio illustrated catalogue.
ABBEY & IMBRIE, Manufacturers of Every Description of Fine Fishing Tackle,
18 Vesey Street (Fourth door from the Astor House), **New York.**

The Schultze Gun Powder Company, Limited,
82 GRESHAM STREET, LONDON, ENG.,
Have the pleasure to announce they have opened an agency for the sale of their well-known Smokeless Sporting Powder, the

IMPROVED
GRANULATED WATERPROOF

Schultze Gunpowder,

At VON LENGERKE & DETMOLD, No. 8 Murray Street, New York,
Where it may be obtained at WHOLESALE OR RETAIL. Price, $1.00 the canister, equal to 1 lb. Curtis's & Harvey No. 4 Black. Dealers' discount on application.

The Schultze Gunpowder has firmly established itself in England and on the European continent as excelling all rivals, giving GREATER PENETRATION, CLOSER PATTERN, LESS RECOIL, LESS SMOKE, LESS FOULING than any other powder. It has *no prejudicial effect upon the barrel*, and is *practically unaffected by damp*. Charge as compared with best black powder equal by measure or half by weight. **It is loaded with the utmost ease exactly as black powder.** It requires *no ramming* or pressure in loading. American cartridge manufacturers are now experimenting with a view to issue a primer of the same strength as the English primers to do away with any possible slow fire or the necessity for priming with a few grains of fine black powder.

As regards trap shooting performances, Schultze Gunpowder is the champion powder, having been used by the prize winners at all the principal meetings both in England and on the continent during the last eight years. During the late international week at Hurlingham and the London Gun Clubs, June 13-18, 1887, the gentlemen who used Schultze secured prizes amounting to £3,200, against £500 won by those using all other explosives combined. Numerous experiments carried out by the English Proof-House Guardians, and by the editor of the London *Field* and others have proved beyond question that Schultze Gunpowder, while being equal in propelling force to the best English black powders, gives less pressure on the barrel even when subjected to varying temperatures, and is therefore as safe to use as black powder.

A NOTABLE ART ENTERPRISE

The Sportsman's Reverie.

A SERIES OF PICTURES FOR SPORTSMEN.

READERS of the FOREST AND STREAM cannot fail to recollect Mr. Thomas F. Watson's poem entitled, "The Sportsman's Reverie," printed in this journal about two years ago. Later on a few stanzas were added to cover other scenes of typical American sport with the gun. The author depicted vividly the varied visions which come before the view of the veteran sportsman as he sits in easy chair before the fire. Of the author and his poem the *Detroit Free Press* said in an appreciative notice: "The author is evidently a man of the most acute sportsmanly enthusiasm, as well as of nice literary taste. His poem is built upon a very simple plan. Before a cheerful fire—like Ike Marvel's hero—sits a veteran of rod and gun; he grows half drowsy over pipe and fire and the poet has caught—with a nice and sensitive appreciation—the reminiscences of a hundred hunts which flit through his brain. One experience after another is described with graceful pen touches; the quail, the woodcock, the snipe, the deer, fall before the crack of the gun; a long day's sport—a glorious day such as no man ever compassed between sun and sun—is described, even the trout, from the clear rapid, paying tribute to the prowess of a dreamland sportsman, until at last, with the fall of the quiet night shadows, the sportsman draws his boat to the shore, his tired retriever crouches at his feet, and, with his ducks, the final trophies of his sport, at his side, he looks back over the darkening water; and then, once again at his fireside, the end of the visien comes naturally and gracefully."

And now these "word pictures" of the poet have been complemented with the actual canvas pictures of the painter. Artist-poet and poet-artist have united to give us the poem in a magnificent setting. Mr. Robert Hopkin, the celebrated artist of Detroit, has painted a series of twelve pictures, each telling in color what the poem tells in words. From these paintings have been made superb heliotype engravings, each having beneath it the particular verse of the poem illustrated. The series is remarkable for strict adherence to nature fidelity in portraying action, and artistic merit.

THE TWELVE PICTURES:

No. 1 shows the hunter seated in an easy attitude in an arm chair, gazing reflectively into the fire on the hearth. Above the fireplace are the head and antlers of a deer. The sportsman's right arm is around the neck of his dog, which is resting on his haunches beside the chair. His left hand holds his pipe. The firelight flickers on the floor and around the legs of the chair.

No. 2 represents dawn breaking over a small lake. The night shades are fleeing. A mist is rising from the eastern end of the lake, of which trees fringe the edge. A plover is circling in the air, and in the foreground is a mallard lazily flying out over the glassy water.

No. 3 represents snipe shooting. In the foreground is the sportsman, his body twisted around to the left in the attitude of making a double on snipe. Standing beside him is the setter, waiting for the word to retrieve. To his right is the border of a wood, the branches bending to the strong wind. In the distance are the sails of craft on the lake.

No. 4—woodcock shooting—shows an opening in the copse around whose border a brook is winding. In the foreground, standing deep in the ferns and rank vegetation, is a setter on a point. Behind the dog is the sportsman in the attitude of shooting at a bird flying directly over him.

No. 5 shows a quail hunter in the foreground, walking along ready for the shot, which will follow the rise of the birds, on which the dog is drawing to a point. A haze is over all, and the sky is that of a day in Indian summer.

No. 6 depicts grouse or partridge shooting in the beech woods. The hunter is walking down a slope. The dog has come to a point ahead of him. The bird has flushed and the hunter is shown aiming. The pointer has stiffened into an attitude of strained attention, as he watches the bird fly away. Th upper part of the sportsman's body is in the shadow, the lower part in the strong light of the sun rays.

No. 7 shows an angler reeling in a trout. A brook is tumbling down through the woods and over the rocks into the pool. The sky is cloudy and the sunlight is struggling through.

No. 8—deer shooting—is a forest scene. In the foreground a buck, just shot, is falling on the edge of a lake. Tearing down the slope behind him are two hounds. To the left, behind the roots of an upturned tree, are seen the head and shoulders of the hunter, whose rifle is still bearing on the deer.

No. 9 represents shooting over decoys. A gale is blowing and the water of the channel outside is lashed into whitecaps. In the bay the decoys are tossing in the chopping waves. In the foreground is a point of rushes, in which the skiff of the hunter is partially concealed. The flock of ducks, which has just swung in outside the decoys, is broken by the discharge of the first barrel. One section is wheeling out over the river. The other has broken off to the side and is wheeling out again to meet the first section. Some scattered birds are dashing above the head of the hunter, and he is twisted around in his skiff aiming at a bird flying above and behind him.

No. 10 shows flight duck shooting. The scene is a marsh, on whose broken surface the sun is setting behind the clouds. In the foreground, on a grassy point, are the hunter and his spaniel. The hunter is in a kneeling attitude and in the act of firing his first barrel. The spaniel is plunging into the water to retrieve the bird which has fallen to the first barrel. In the distance are flying ducks.

Nos. 11 and 12 represent the hunter retiring from the marsh and at home, and these two are among the strongest of the set.

The pictures are printed on the best 150lb. plate paper; size of paper 24×30in.; size of print 14½×17½in. The pictures have the tint and tint border, and the artist's remarque and signature, and form artist's proofs, an édition de luxe.

PRICE, $30 FOR THE SET; SINGLE PICTURES, $3.

ANSWERS TO CORRESPONDENTS.

NETTING CHESAPEAKE DUCKS.

THERE has been this season a great destruction of ducks on the Havre de Grace flats by the agency of nets. The shooting season opened on Nov. 1, but long before that date canvasbacks, redheads and blackheads were offered for sale in Philadelphia, and upon examination it was found that they had been trapped in nets and drowned.

These nets are set under water upon the feeding grounds of the wildfowl, ostensibly for the purpose of catching rockfish or striped bass. Three nets are hung upon the same line—the two outside nets are of 12in. mesh and the middle one, which is a 4in. mesh, is loose hung—that is, 100ft. of net are strung upon 50ft. of rope. The duck, in diving for food, meets this obstruction, and its head and neck becoming entangled in the small meshed middle net, it naturally endeavors to force its way through, and in so doing carries the middle net through the large mesh of the outside net, thus forming a pocket in which it is drowned. In the morning the "fisherman," overhauling his "nets for rockfish," takes out the unfortunate ducks and forwards them to market, where they meet a ready sale, though they are comparatively worthless for the table, since they have been strangled and then allowed to soak for hours in the water.

In this illegal manner thousands of ducks were killed before the shooting season opened. Bad as this destruction is, other effects follow this unsportsmanlike method which are far worse for all the men engaged in killing ducks by the legitimate means of shooting them, for it is a well known fact that wildfowl will not remain upon feeding grounds where netting is practiced, but will abandon the place and seek safer waters.

Americans pride themselves, and justly, upon the canvasback, the king of all ducks, and the redheads and blackheads of the Chesapeake are but little inferior; but their numbers are fast diminishing under the ceaseless persecution to which they are subjected. The killing of ducks by a gun, shot from the shoulder, is the only lawful and fair way of obtaining them; but on any still night on the flats can be heard the roar of the murderous "big-gun," by which from 50 to 100 ducks are frequently killed at one shot, and as many more crippled; and now, added to this wholesale slaughter comes the poacher with nets. If something is not done soon to put an end to these illegal methods of destruction, duck shooting on the Chesapeake will soon be a thing of the past.

A PHASE OF HUMAN NATURE.

IT is a curious freak of innate depravity that prompts men to fire orphan asylums, and of like genesis is the inclination now and then manifested to destroy public property attached to fish breeding establishments. Let a State set apart an appropriation for restocking the streams with food fish for the benefit of its citizens, and let the work be undertaken never so wisely, some there will be who will find in the enterprise a real or fancied infringement of their "rights"; and when opportunity offers, good care will be taken to wreak revenge. It will be remembered that when the Commissioners of Fisheries of New York established a trout hatchery at Little Clear Pond, in the North Woods, certain hoodlums of that vicinity banded together and destroyed the nets which had been set in the pond to take breeding fish for the hatchery. These Adirondack savages conceived that the State's work meant interference with their own private particular interests in these fish; they had always fished in that water, they had a right to keep on fishing there; this right was inalienable, and if the nets of the fish hatchery interfered, so much the worse for the nets. They accordingly ripped up the nets and did what they could to destroy the tools of the Commission and thwart its work. They acted very much as the South Sea Islanders who fall upon and devour the missionaries sent out to civilize them.

The same motives appear to have animated the gang of ruffians who destroyed a weir of the Maine Fish Commission last week.

A few years ago the Maine Fish Commission caused to be constructed at Edes Falls, on the Crooked River, one of the principal inlets of the Sebago, a weir, for the purpose of taking all the landlocked salmon that should attempt to ascend that stream to spawn. During the breeding season immense numbers of these fish run up that river. In fact it is the belief of those in the best position to know that the greater part of the salmon in the lake seek this river as their spawning bed, and hence by the use of the weir the Commission had hoped to secure the great majority of these fish for breeding purposes. Then after they had been stripped of their eggs they have been returned to the river below the weir, from whence they could seek the lake below. Previous to the construction of this weir the inhabitants for miles around were in the habit of visiting the river and taking these immense fish from off their spawning beds and putting them to various uses. It is related of one man that he did not like "traouts, but they was good to feed the hogs on." Hence it was that the construction of the weir and the hatching works at Edes Falls was not looked upon with favor by the dwellers along the river. The complaint came that all the "traouts" were being stopped, and though it is always in the close season that these landlocked salmon spawn, yet the people of that section are not entirely silent in their denunciation of the works of the Commission on the river below.

Though there have been dire mutterings, and once or twice men have appeared in the night time and threatened the keepers of the weir, no very marked disturbance has resulted till this year. One night last week, at about 2 o'clock A. M., the keeper of the weir, hearing some noise outside, went out. At once he was set upon by a man with a gun in hand; with the man were eighteen others. All of them had their faces blackened, so that they could not be recognized. They intimidated the keeper, Harriman, who was alone, save for his little boy; and the miscreants proceeded to their work unthwarted. They broke up the weir and turned all the salmon in the tank loose in the river above the works, evidently with the purpose that they might be afterward stolen, either by themselves or their friends. The keeper was left under guard till the masked men had killed or let all the salmon loose. The Commissioners were at once advised of the outrage, and they visited the ground and repaired the damages as far as possible. The Commission had gathered in the weir, up to that time, 140 fish from which they intended to take the eggs. These were all turned loose, and according to their natural instinct, they immediately started up stream. The keepers and the Commissioners have since recaptured 25, and they hope to get still more. The thieves did not destroy any eggs, as they were all in the hatchery two miles away. But the liberation of the fish and the destruction of the weir will seriously interfere with the work of the Commission this year. Last year 750,000 eggs were taken, and the Commissioners had hoped to get a million this year. Instead of that number, not over 250,000 can be taken under the most favorable conditions. A curious feature of the whole situation is that, by a law of the State, the eggs cannot be taken from these fish to be used in restocking other waters, but they must be returned to the waters of Sebago Lake.

The Crooked River poachers evidently share the feelings of the Clear Pond net cutters. In the Adirondacks the better sentiment of the community finally prevailed, and a paper was signed by many resident guides and others setting forth their detestation of the vandalism. Something of the kind is now in order from the respectable citizens of the Edes Falls district; in default of which Maine would do well to give over planting salmon eggs and send agents up there to sow the seeds of intelligence and common sense.

SNAP SHOTS.

ATTENTION is invited to the warning afforded in the harsh fate that overtook an Ithaca young man last Sunday. This ardent hare hunter was so possessed of his mania that he would not confine his pursuit of game to the six days allowed by law nor to the agents legalized by the statute. He carried on the campaign on Sunday and had a ferret to help. The ferret knew no better. When the young man used his gun as a stick to poke the hare out of the hole the gun went off and killed the hunter. It was a punishment altogether disproportioned to the offense, but when gunpowder and a charge of shot volunteer to punish double-headed infractions of the game laws, they cannot be expected to do the work with the discretion of a game protector who is paid to be discreet.

The *American Kennel Register* in the November number brings the total list of entries up to 5,582. The fifth volume will close with the December number. The annual entries average over a thousand. The *Register* is constantly growing in value as a book of reference, and breeders and owners are constantly testifying to their appreciation of its worth. The *Register* moreover has a clean record; there is in it no material for the making of those charges of business mismanagement and sharp practice which have for years been the tiresome adjuncts of another enterprise in the kennel stud book field of literature. The publishers of the *Register* have won a permanent place for this monthly record by fair dealing and efficient service.

There is manifested a tendency to complain of large game preserves on the assumed ground that clubs and private lessees of extensive tracts of wild land have not a legal right to forbid trespass. It must be clear, on sober consideration, that such leases are within the law, and the right to prohibit others from shooting or fishing is not invalidated by the extent of the preserve nor by its wild nature. Objections to the growing system of private game grounds cannot reasonably be lodged on the score of illegality. Whether or no the system is to be condemned for any other reasons is a legitimate topic for discussion.

The more we learn of the stage robbery on the borders of the National Park last summer the more farcical the episode appears. Two of the "road agents" have been arrested and they turn out to have been extremely degenerate followers of Dick Turpin. They were not after plunder, but were bent on getting revenge. One of them had been put out of the Park for violating the rules and he thought it would be a fine thing to vent his spite by intimidating law-abiding and decent Park visitors. The other was a discharged employe of the transportation company, whose business he hoped to injure.

The elegant club house of the Robins Island Club was destroyed by fire last Monday afternoon, the loss amounting to $20,000. The annual field trials of the club, which were to have begun last Tuesday, have been postponed. A new club house will be erected at once.

UNDER THE JACKLIGHT.

SILENCE, silence, silence; save, perhaps,
Some still small night voice in the bog grass near
Bespeaks a hidden drama's haps and mishaps,
But with bay-like bark, breaking upon the startled ear,
The great owl stirs anon the lonesome echoes, till their lapse
Gives chance the querulous complainings of the lesser one to hear.

Silence, soundless silence; save now and then
A tinkling dripping from the paddle blade,
But it ceases, and there's silence absolute again.
Then, breaking the list'ning hush of its lonely forest glade,
With smothered roar some giant tree of years untold of men
At last lies down to rest beneath its comrades' shade.

Darkness, deepest darkness; save that there
Upon the inklike water lies a single star,
But shivered by a beaver crossing to its lair.
No; the place is soundless, sightless, near and far.
Then the vanguard breeze of morning stirs the heavy air;
Comes the gray edge of day and the moon's last thin bar.

YONKERS.

MAID OF BEECH.

I HAVE just come in from sawing my sticks of beech wood, my daily allotment to keep my wood fires in feed.
